**EMERY-WHEELS.**—In a recent paper presented to the Polytechnic Section of the American Institute, Mr. L. Duvinage divided the emery-wheels now in the market into two general classes. One class of wheels has the grains of emery joined and consolidated by a pitchy material, as rubber, linseed oil, shellac, etc. These must run at a high speed to burn out the cementing material by friction, loosening the worn grains and thus revealing new cutting angles. These are non-porous wheels. Turning up this class of wheels is done with a diamond tool. The other class consists of two kinds—one made by mixing the emery with a mineral cement and water into a paste, which will harden and bind the grains together; the other kind by mixing the emery with a mineral flux or clay, molding into shape and burning in a muffle at a high temperature. These are porous wheels, in which the grains of emery are held together by matter having affinity therefor. This class of wheels, unlike the grind-

stone, has sharp grains of emery hedged together among matter which, in some cases, is as hard and sharp as the emery itself. Such wheels cut very greedily, and do not need to be run at any particular speed. The dresser, made of hardened steel picks, is the proper tool for turning up this class of wheels.

**A NEW COUPLING FOR TRANSMITTING POWER.** A novel and ingenious means of transmitting power through a right angle has recently been devised by Mr. T. R. Almound of 83 Washington street, Brooklyn, N. Y., by whom the device is also manufactured. This coupling or quarter-turn motion, which is called "The Almound Coupling," is used for communicating power at right angles from the ordinary position without the use of noisy and expensive beveled gear, or the quarter-turn belt, over either of which it possesses decided advantage. It is so incased that the lubricant is not allowed to escape, but is held in such manner that it requires attention only at long intervals, and no dust can reach the journals or bearing surfaces. The coupling runs smoothly and noiselessly, and with very little friction. It can be held to the ceiling in any position that would be strong enough to support a hanger. The gain in the matter of power by the use of this device is of importance, as much less friction and consequent loss of power occur than with the gears of quarter-turn belt. The introduction of this device it is said has been very successful, and has elicited the warm approval of many of the leading manufacturing firms who have adopted it.

**LEAKAGE IN BOILERS.**—The *Locomotive* says that leakage at the tube ends is one of the most frequent and annoying defects to which the ordinary horizontal and upright tubular boilers are subject. It adds that the corrosion which this leakage induces speedily brings about a dangerous condition of things. This statement of affairs is undoubtedly correct; but when our contemporary argues for the pound of cure we must part company, because our preference is decidedly for the ounce of prevention. The one thing better than to be continually tinkering with boiler head and tubes is to manufacture the boiler of a material that is the least liable to corrode. Such material is refined iron, and its use insures the greatest possible immunity from corrosion and its attendant annoyances and dangers. The manufacturers of steel plates have of late been using a magnesia "physic" in their crucibles, and thereby greatly increased the tendency of their product to rust out. But they do not dare to leave the magnesia out, for then the gas cells in the ingot will be found as great flaws in the plates that come from the rolls. To grasp either horn of the dilemma seems fatal. Without magnesia, steel plates are full of flaws; with magnesia, the plates corrode. Refined iron is free from either fault.

**NEW METHOD OF MELTING IRON.**—A new method of melting iron has been devised in Germany. The cupola is supplied with blast through two tuyeres, one above the other, there being 18 in each set; the tuyeres are ports, with the form of a vertical slot, and are directly connected with a tuyere ring. The particular feature of the cupola is that the bottom is a slightly inverted arch, which is pierced by two openings, through which both blasts, or rather imperfectly consumed gases of combustion, and the fluid can flow. Below is a small chamber in which the iron collects. It is heated by the gases forced downward from the cupola above, these being supplied by the necessary air for combustion by a special tuyere leading to the main pipe, the chamber at the same time serving to preheat scrap, etc., which need only to be pushed into the bath for dissolving it. Of course, considerable quantities of scrap can be used by directly charging an ordinary cupola, but it is claimed in this case the advantages presented are economy of fuel and a greater facility for making sharp, strong castings, and a purer description of metal.

**INCREASED TENACITY NEEDED IN STEEL.**—Mr. Goodhal, an English ironmaster, read a paper at the late meeting of the Civil Engineers' Association, in which he suggested that if steel-makers could increase the thickness of ingots and improve the homogeneity of the metal, there was little doubt but that plates of much higher tenacity could be used than are at present employed. Probably in addition to the special mild steel for plates for furnaces, and the other quality, which was the same for flanging purposes and for shell-plates now in use, it might be possible for steelmakers to introduce a third quality for steel only, and by gradual steps to obtain a considerable increase of tenacity in the material. At the same time a uniform width should be specified for the samples tested, and some stipulations made as to the minimum proportion to be allowed between the breaking and permanent set.

**THE USE OF THICKER PLATES IN STEAM BOILERS.**—The growing demand for steam of higher pressure for use in steam engines is working in the direction of permitting the use of thicker fire-plates in steam boilers. It is a direct move backward. Experience has shown a hundred times that thick fire-plates were a delusion, at the best giving a feeling of security without basis. If higher steam pressure is desirable, as it no doubt is, the construction of boilers should be so changed as not to require thick fire-plates.—*American Machinist*.

## SCIENTIFIC PROGRESS.

## Emery Wheels.

At the meeting of the Polytechnic Section of the American Institute, held December 8th, L. Duvinage, in a paper, of which this is an abstract, said that the increased quantity and quality of work that goes out of the modern machine shop was due to the skillful use of solid emery wheels. He said that a grain of sand from the common grindstone magnified would look like a cobble-stone, a fracture of which shows an obtuse angle, whereas a grain of corundum or emery would look like a rhomboid, always breaking with a square or concave fracture. No matter how much it is worn down in use it does not lose its sharpness; hence it is evident that the grindstone rubs or grinds and heats the work brought in contact with it, while the corundum or emery wheel, with its sharp angular grit, cuts like a file or circular saw.

There are two general classes of emery wheels in the market—one class of wheels has the grains of emery joined and consolidated by a pitchy material, as rubber, linseed oil, shellac, etc. These must run at a high speed to burn out the cementing material by friction, loosening the worn-out grains and thus revealing new cutting angles. These are non-porous wheels. Turning up this class of wheels is done with a diamond tool.

The other class consists of two kinds, one made by mixing the emery with a mineral cement and water into a paste, which will harden and bind the grains together; the other kind by mixing the emery with a mineral flux or clay, molding into shape and burning in a muffle at a high temperature. These are porous wheels in which the grains of emery are held together by matter having affinity therefor. This class of wheels, unlike the grindstone, has sharp grains of emery hedged together among matter which, in some cases, is as hard and sharp as the emery itself. Such wheels cut very greedily, and do not need to be run at any particular speed.

The dresser, made of hardened steel picks, is the proper tool for turning up this class of wheels.

Manufacturers in metal goods aiming in reducing the cost of production would do well to look into the adaptability of the solid emery wheels or rotary file and other labor-saving machinery before deciding on reducing wages of labor.

## BROZEN FLOWERS.

According to the *New York Sun*, M. Truy, the French Consul at New York, has in his parlor the evidence of a new preservative art recently devised by a Frenchman. This evidence consists of a huge decorative piece, seemingly of roses, rosebuds, violets, smilax and other flowers and foliage, apparently carved with most exquisite delicacy in bronze. The most minute curves and veinings of the smallest petals and leaves are preserved with infinite exactitude, so that it would seem as if the piece represented years of patient application of the highest skill in this difficult branch of art. In point of fact, however, the whole thing was produced in a few hours, and at small expense, by the new process of plating, the invention of a Frenchman. Each bronze flower and leaf incloses the real original, upon which the metal has been deposited by electric action, and it is affirmed that the roses so incased retain indefinitely their perfume, and, even in their deepest interiors, their natural colors. The same process is applied in the making of silver flies, beetles and other insects, and even in the coating of lizards and small snakes for the ornamentation of parasol handles and cane-heads. The dead insect or reptile is hermetically sealed up in its metal coat, and, it is said, will never decay, at least until the metal is worn through, and, as the deposit may be put on as thick as is deemed advisable, they may be made to last as long as people's liking for them as a novelty endures. The fidelity to nature in these reproductions is wonderful.

Heretofore something has been done in the direction of plating non-conducting surfaces by giving them a primary coating of plumbago, but that always was a necessarily imperfect process. The French electrician substitutes for that a bath—the composition of which is a secret—into which the objects to be plated are plunged for a few seconds. When they are withdrawn they dry off almost immediately and seem to have upon them a faintly discernible coating like the bloom upon a plum. They are then plunged into an electric bath, and any metal desired is deposited upon them.

**IRON AND ALUMINUM.**—Iron is at present the most useful, best known, costs less, and more generally used than any of the metals. It is found everywhere, used everywhere and has the reputation of being the oldest inhabitant in many ways. Iron is subject to a variety of prices, all depending upon the labor put upon it; pig iron may be worth from \$15 to \$20 a ton, but a ton of watch-springs might trouble a capitalist to pay for them. Thus we are impressed with the fact that the value of a metal depends upon the use that can be made of it, and the labor involved in its production and preparation. At present the price of iron is

such as to keep a great many furnaces in operation, and when furnaces are kept going, do not find it necessary to "blow out for repairs." We conclude the price is satisfactory to the men who convert the ore. There is another metal, however, which is fast coming to the front, and which will answer nearly all the purposes for which iron is used, and in most cases much more satisfactorily. The only thing that keeps it in the background is the cost of producing it from its ore. But that has been reduced 200 or 300 per cent within a few years, and the work of cheapening its production is still going on. We allude to aluminum. Common clay is the ore of aluminum, and it is even more generally and abundantly diffused over the earth than are the ores of iron. We propose to speak more fully of this, as the coming metal, in our early issue.

**LACES MADE OF STEEL.**—A dealer in laces was exhibiting to an inquisitive reporter a remarkably tasteful specimen of lace of an extremely delicate pattern, and so light that it could almost be blown away by a breath of air. Had it been woven of spider webs, it could not have been much lighter. The reporter wondered what it was made of, and the dealer wanted him to guess. He said "silk;" not being correct, he guessed numerous other things and at last struck "steel." "Yes," said the dealer, "it is made of steel rolled as fine as the point of a cambric needle. It was not woven but stamped out of a sheet of low-grade steel so that it would not be too brittle. This is only an experiment," he said, "and was turned out of a small Pittsburgh mill and sent to me to show what can be done in that line. In the course of time other patterns will be made, heavier, perhaps, but certainly more tenacious than this piece. They can be used for children's underwear and hats very nicely. There is no question as to its durability, and its cheapness makes it the most salable of all laces in the market. I am looking for its perfection with great interest. It will create a small revolution in the market."—*N. Y. Mercantile Journal*.

**NATURE-SMELTED IRON.**—On the North Saskatchewan river in the Northwest Territory of Canada, about 80 miles above the town of Edmonton, Alberta, there is an interesting example of naturally reduced iron. Along the river-bank a lignite formation crops out for several miles, overlaid by clay shales and soft argillaceous sandstones containing nodules of clay ironstone. These nodules are similar to others found at Edmonton, and proved by analysis to be carbonates of iron, containing 34.98 per cent of metallic iron. The Saskatchewan seam of lignite has at some time or other been burnt, leaving a bed of ashes, clinkers and burnt clay, in places 20 feet thick, and now covered by a dense growth of grass and underwood. From this mass of burnt clay pieces of metallic iron can be picked out, weighing in some cases 15 or 20 pounds. They have evidently been reduced from the nodules above mentioned by the heat of the burning lignite. Most of the pieces of iron are much rusted, but when scratched with a file they show a bright surface. The observation is interesting, and to some may help to explain how primitive men originally discovered the reduction of iron ore.

**A NEW OIL.**—It is reported that the State Chemist of North Carolina has received a report of the discovery by a Wilmington chemist, W. A. Martin, of a new oil and a process for obtaining it. The double discovery is thought to be quite valuable, and promises to be an acquisition to the industries of the country. The oil is a hydrocarbon, and vegetable in its nature. It can be obtained from any source not mineral or animal—as from wood or other vegetable matter. It is pure oil, colorless, and has a very faint and hardly perceptible odor, not at all disagreeable. It is perfectly neutral, will not ferment or become rancid, and remains perfectly limpid in cold weather. As an illuminant it gives a strong, brilliant light, and is non-explosive. It makes a splendid lubricant for machinery of all kinds, and in every respect it is superior to lard oil, and is a great deal cheaper.

**POWDERED COAL FOR FUEL.**—A press telegram from Chester, Pa., Jan. 24th, says: At the Chester Iron Works for the last few days, there has been successfully tested the application of powdered coal for fuel. The combustion is perfect. Both ashes and smoke are entirely consumed, effecting a saving of from 40 to 50 per cent in fuel. The coal is powdered by the cyclone principle and applied to the furnaces by a process invented by J. G. McCauley.

**HOW MANY FORMS CAN MATTER TAKE?**—All matter can be resolved into four aggregate forms—solid, liquid, gaseous and imponderable. There are no sharp lines of distinction between these four forms; that is, a body may be in a semi-fluid state, like glaciers which flow in a solid state, and many soft substances are neither solid nor liquid; they may be called plastic.

**PHYSICAL EXERTION.**—A physician lecturing upon physical exercise declared that if only 20 minutes a day were spent in that manner as an adjunct to mental education we might live to be 70 without a day's illness and perhaps prolong our lives to 200 years.

## USEFUL INFORMATION.

## The Best Possible Method of Plastering Walls.

We give below a very interesting and instructive paper, recently read before the S. F. Chapter of the American Institute of Architects by J. P. McMurray of this city, a well-known manufacturer of plaster decorations. The paper forms a complete monograph of the philosophy and art of making and using plaster. We copy from the *California Architect*:

Before we consider the best method of making and applying mortar to walls, let us examine the nature and properties of the materials used and their chemical action upon each other. If these facts can be correctly ascertained we will be better prepared to bring about the proper result, as it will be evident that any process or condition that facilitates the natural, chemical or mechanical action of the material used will improve the mortar.

The common limes are nearly pure carbonates of lime, the only effect of burning them is to drive off the carbonic acid. By slaking them the lime becomes a hydrate, and in this state is capable of acting chemically, though feebly, on the surface of pure siliceous sand. As such sand is silicic acid, all alkalies are solvents in a greater or less degree. This combination causes the first setting of the mortar, which is also strengthened by the mere mechanical action of the sand. The greater part, however, of the lime has not combined with the sand, but remains in the state of a hydrate, in the proportion as the latter absorbs carbonic acid from the air it gives out its water and passes to the state of a carbonate; such mortar therefore acquires its final hardness and dryness when the whole of the hydrate has been decomposed and the water has been replaced by carbonic acid. In losing 22 per cent of water it combines with 46 per cent of carbonic acid.

We have now a general idea of the nature of the materials under consideration, and will proceed to make our mortar with the best lime and clean, sharp sand. (Lean in sand is always detrimental, but clayey earths are not necessarily so.) We will use our judgment as to the proper proportions of lime and sand, as a barrel of lime varies in strength as well as in quality, owing to the size of the lumps, and the sand varies in degree of coarseness. The lime should be slacked under water and not allowed to burn. This should be mixed with an abundance of good long hair before the sand is worked in. The hair should be thoroughly beaten before soaking so as to break up all clots, which are a source of weakness as well as a waste of material. The sand should then be well mixed in, as the grit assists in the separation of the hair, and a thorough mixing of the sand and lime at this time is very important, as it materially assists in bringing about the first condition of hardness by having every particle of sand in contact with the lime. The longer it remains in this condition, if moist, the better for freeing the silica of the sand.

The mortar is now ready for use if the lathing is properly done. Green laths are best for several reasons, they retain the proper width of key, which should never be less than three-eighths of an inch. While the dry lath as soon as wet, swell and pinch the key, thereby weakening it, shrink, as the mortar dries out, and repeat it with every coat of mortar, which must effect to some extent the bond between the lath and the mortar, the green lath retain the full width of key and shrink only once, and then very gradually, and do not split at ends by nailing as the dry lath. The joints should be broken every five or seven laths, as the settling of joints or the springing of a stud makes a crack by the opening of butt ends of lath. No knotty, sappy, or unusually thin lath should be used. They can be put on quite open, as we will use our mortar well haired and not wet and slushy, and to bring about this result we will temper the mortar 24 hours before using it, which will add materially to the first condition of hardness by bringing fresh particles of lime in contact with the silica of the sand, not pulled down and hashed up with water, but well tempered with the blade of the hoe as if for immediate use. When ready for use there will be less water in its composition, and yet it will be of proper consistency to spread. Mortar thus treated will make larger and stronger keys, being tougher, and the particles of lime and sand form a closer union, thus assisting the second or mechanical condition of hardness as well as the chemical action of the material. Mortar, like steel, is improved by working it. This coat should just cover the lath nicely, no matter how thin, as we will draw up on the same scaffold with a good heavy coat of brown mortar, made as the first, but without hair, and containing more sand. This we will leave with the proper application of the darby.

We draw up with brown mortar for the reason that the mortar applied to the lath requires more time to make it adhesive to the wood and toughness to hold the key from dropping. If it is drying weather the windows should be in, or the space covered with muslin to insure slow and uniform drying to assist in the third condition of hardness. At the proper time it must be well floated, not only for the purpose of leveling the surface, which is of only a secondary importance compared to the working up and compressing the mortar, but to bring the particles together, as a large portion of the

water has evaporated, leaving air spaces to be filled by compression. The proper time to float is when the larger portion of the water has evaporated and the moisture apparently gone; but the proper application of the float brings the moisture to the surface, leaving a nap on the surface of the wall.

Floating when dry does injury by weakening the parts when there is not moisture enough in the wall to make it adhesive again. When dry, finish with high-gaged stuff. The best and least wavy surface can be produced by laying on the gage-stuff with a float and drawing up with a trowel; the wooden float cuts through an inequality on the wall, while other smooth steel trowel has a tendency to slip over it.

The above method is two-coat work, properly speaking, calling for more labor than the usual way of putting on two-coat work. And we believe that it complies better with the conditions and natural qualities of the material used than any other process in practice. But as there is a very general belief that a good job of plastering should have three coats of mortar, it will be necessary to compare the merits of the two methods as practically in use. In three-coat work the scratch coat must be necessarily thin, as there is to be a brown coat over it; if the scratch coat were to be heavy, the brown coat would weaken by overloading the wall or ceiling, as the brown coat has to be sufficiently thick to cover the irregularities of the scratching and raking up of hair and mortar in scratch coat. Therefore, the thin scratch coat is cut up and weakened by the scratching, and being thin, it dries out rapidly, not having time for proper crystallization, and when dry the heavy sandy brown mortar requiring pressure to spread, springs and enflees the keys more or less. The lath, if dry, goes through a second swelling, and the brown coat dries quickly, as it has the atmosphere on one side and the lath and scratch coat on the other to absorb the moisture, and the union between the two coats is never perfect and can be often seen separating by the air on sides of casings, etc. And in regard to straightness, that should be done on the joists and studs previous to lathing. It is not good practice to overload lath to straighten a wall, and there is no reason why a straight wall should be made crooked by the application of  $\frac{3}{4}$  of an inch of mortar if properly applied. It might be well to say here that grounds  $\frac{3}{4}$  thick are sufficient for lath and plaster, and every wall should have that amount on all its parts.

By the two-coat process we get the proper kind of mortar on the lath for keys and adhesion to the wood, the brown coat with the proper sand for strength, which also prevents cracks by having sufficient sand to prevent shrinkage and giving as heavy a body as the lath should be required to carry, which is all in one body, the union being perfect and a thick moist body, which insures slow drying, and, what is of great importance, a plastic body to float and compress, if taken in the proper time and no hair to collect in tufts on the surface by floating. The strength of the above wall can be greatly increased by the addition of, say, one barrel of plaster of Paris to the hundred yards of the first application, as this coat is where the greatest strength and adhesion are needed. There are probably sufficient glutinous scraps in the hair to retard the set of the plaster; if not, a little glue size may be added, so that no inconvenience may occur by fast setting. By far the hardest walls we have ever seen were composed entirely of sand and plaster of Paris, about two parts of sand to one of plaster, mixed with hair and applied in the usual manner as common mortar.

## GOOD HEALTH.

## Removing Excrecences by Electricity.

A correspondent of the *Electric Review* furnishes the following interesting and novel facts under the above head: The wife of a friend of the writer had on her right shoulder a blemish in the form of a large mole, quite half an inch in diameter, which practically made it impossible for her to wear half or evening dresses, which should reveal her otherwise shapely shoulders. She accidentally heard of the electric operations, and, obtaining the address of the surgeon who performs them, she went without her husband's knowledge to his office and submitted to the operation. It required about a week to heal the wounds made by the needles with which the mole was perforated in every direction; then the mole, which had been burned to a dry, black crisp, fell off, leaving the shoulder perfectly white, and with only the slightest indication to show where the discoloration had been. A new skin formed over it, and there is hardly a noticeable blemish there now. Success inspired her to insist on her husband's undergoing the same operation on a more delicate part of his person—namely, his nose. He tells his own story thus:

"I had on my nose at birth, so I was told, a wen, which grew with my years until I became a man, and for many years it greatly disfigured my countenance. It was about the size of a pea, and was on my left nostril. It changed color from time to time, and would grow to be a frightful sanguinary red whenever I indulged myself with wines and liquors of any sort. I came to regard it at times as a gin-blossom, and an irreverent reporter in describing me once suggested that this object had evidently been one of long and patient

and costly culture. I went, on my wife's urgent entreaty, to her surgeon and asked him if it could be removed. He looked at it and suggested that it might be if I would not look upon the wine when it was red; but I told him I was born so. He examined further, and at once proceeded to operate upon it.

"I bathed my nose, first of all, in cocaine. It grew cold at first, then became perfectly numb, as though asleep from lack of circulation of the blood. It felt as if paralyzed. He then applied an electric needle to the wen, sticking it through and as near the roots as possible. There was no pain, though half an hour was consumed in the operation. Whenever he increased the current of electricity I saw billions of stars, and sparks seemed to flash from my eyes, and the eyeballs seemed to crack with each spark that apparently flew from them. When the operation was completed the wen was black, no longer red, and more unsightly than ever. He put flesh-colored court-plaster over it and kept it there for about a week. Then in washing it off the mass of blackened flesh fell away. A new skin formed, and you can barely see a small scar where the unsightly object once was."

## Celery as Food and Medicine.

Numerous cures of rheumatism by the use of celery have recently been announced in English papers; but the following, more in detail, is given on the authority of the *New York Times*: "New discoveries—or what claim to be discoveries—of the healing virtues of plants are continually being made. One of the latest is that celery is a cure for rheumatism; indeed it is asserted that the disease is impossible if the vegetable be cooked and freely eaten. The fact that it is always put on the table raw, prevents its therapeutic powers from being known. The celery should be cut into bits, boiled in water until soft, and the water drunk by the patient. Put new milk, with a little flour and nutmeg, into a saucepan with the boiled celery, serve it warm with pieces of toast, eat it with potatoes and the painful ailment will soon yield. Such is the declaration of a physician who has again and again tried the experiment, and with uniform success. He adds that cold or damp never produces but simply develops the disease, of which acid blood is the primary and sustaining cause, and that while the blood is alkaline there can be neither rheumatism nor gout. English statistics show that in one year (1876) 2640 persons died of rheumatism, and every case, it is claimed, might have been cured or prevented by adoption of the remedy mentioned. At least two-thirds of the cases named heart disease are ascribed to rheumatism and its agonizing ally, gout. Smallpox, so much dreaded, is not half so destructive as rheumatism, which, it is maintained by many physicians, can be prevented by obeying nature's laws in diet. But if you have incurred it, boiled celery is pronounced unhesitatingly to be a specific."

The proper way to eat celery is to have it cooked as a vegetable after the manner above described. The writer makes constant use of it in this way. Try it once and you would sooner do without any vegetable, with the single exception of the potato, rather than celery. Cooked celery is a delicious dish for the table, and the most conducive to health of any vegetable which can be mentioned.

**THE DYSPETIC'S IDEAL.**—A medical man mentions that like his father and paternal grandfather, he always had the power of voluntarily ejecting food or fluid from the stomach at any time. When troubled with acidity or nausea, the stomach is emptied at will without the slightest difficulty, and may be washed out with several glasses of water. At college this faculty was used for gain, large doses of narcotic poisons being swallowed for wagers, and afterward immediately expelled. An investigation is suggested to determine the cause of this gift, or what voluntary muscles account for it.

**THE VALUE OF CONDIMENTS.**—The value of the various condiments in the preparation of combination dishes is great. Used with discretion they stimulate the appetite and promote digestion, red pepper being specially valuable in this connection. The various herbs and spices are exceedingly valuable; salt is absolutely necessary to health, despite all contrary assertions of the food oranks, and the condiments employed in making salads promote the digestion and assimilation of all food eaten at the same time.

**THE USE OF VINEGAR.**—Experiments have shown that even so small a quantity of vinegar as one part in 5000 appreciably diminishes the action of saliva upon starch. One part in 1000 renders it very slow, and twice the latter quantity arrests it altogether. From this it is evident, says our cotemporary, that vinegar pickles, salads and other preparations in which vinegar is used are unwholesome, especially when taken with farinaceous food, such as bread and other preparations.

**HEALTHFULNESS OF SOILS.**—Extended observations at Paris and at Munich indicate that the sanitary condition of a location depends on the amount of water contained in the ground. The years in which there has been a large quantity of ground water present have invariably been the healthiest years, while those in which there has been a smaller quantity have invariably been one of the unhealthiest periods.

## Dakota Tin.

Prof. Carpenter's article on tin in the recently issued volume on the resources of Dakota by Commissioner McClure presents the matter in a very fair and concise manner. After calling attention to the manner of its discovery in 1883, and outlining the tin belt, he next proceeds to discuss the geological formation of the districts in which it is found.

"The tin stone is found in granite veins or dykes in the earlier or schistose Archean, shown upon the map, and which vary in width from a few inches to hundreds of feet. In some sections the veins consist of an albitic gneiss, that is, rock composed of albite feldspar and mica, through which is disseminated crystal of cassiterite. In other sections, as upon the west side of Harney's peak, the veins are composed of typical gneiss, that is, quartz and mica."

"The percentage of tin stone in the gneiss varies," Prof. Carpenter goes on to say, "but there are many veins carrying rock yielding from three to four per cent." That this is not a small percentage is shown by comparison with the mines of Altensburg in Saxony and elsewhere. The Altensburg yield is from one-half to one per cent; in Cornwall the yield is less than two per cent. "In the Palbiero district in Cornwall, as shown by the Government statistics, the yield is on an average of five years, .89 of one per cent," and yet, it is added, these mines yielded a fair profit.

Prof. Carpenter then gives at length a statement of the development of the mines in both the northern and southern sections of the tin belt, or region rather.

It will have to be conceded that the tin interests of the Black Hills have been advanced materially during the past year. This is noticeable in many respects. One rarely ever hears it disputed now that there is tin here. This was not the case a year ago. The well-known rarity of the metal was a cause of skepticism to many. Numberless instances could be cited where false hopes had been raised and millions of dollars squandered in prospecting for the valuable metal by similar announcements of the discovery of tin not only in the United States but in other parts of the world. And many believed in perfect good faith that the present discoveries would turn out in a similar manner. Besides, too much was claimed for the Hills by enthusiastic persons. Like the quack medicines which are advertised to heal everything and thereby cause the people to doubt their worth in any respect, the Black Hills were reported to possess every mineral known to the geologist. Many persons were thus led to believe that tin existed only in the imagination of the prospector.

The only question which is now unsettled is whether it can be found in quantities sufficient to pay for the reduction of the ore. This also, it seems, is being rapidly settled in the affirmative under the light of fuller investigation and development.

The whole matter is now undergoing a thorough examination by the parties who visited the Southern Hills last summer, and when a conclusion is reached it will settle the question probably for all time. The tin interests may actually be said to be in the balance being weighed, and every one heartily wishes that there may be nothing found wanting. Nothing else will add so much to the wealth of this country, or tend to fix its position so prominently upon the map of the world, as the establishment of tin industries.—*Deadwood Pioneer*.

## An Elaborate Watch Dial.

A gentleman connected with the Illinois Watch Co. has a wonderfully curious watch dial on a movement of this company's make. Instead of the roman numerals to denote the hours, there are 11 small but very distinct silhouette figures, representing a man starting out with his dog for a day's sport. At 7 o'clock he is seen starting out with his gun and dog; at 8 o'clock he makes a shot; at 9 o'clock he has a sand hill crane which measures as long as himself; at 10 o'clock the man and his dog are scared at the sight of a jack-rabbit, which is sitting upon his hind legs, with his big long ears raised above the bushes; at 11 o'clock the hunter takes a drink, and while at this attitude the dog sits in front of his master, with his nose pointing directly at the flask; at 12 o'clock the sportsman is seen sitting on a stump, and is eating a lunch—the dog is eyeing the piece of bread which the hunter has in his hand. At 1 o'clock he starts out to fish the rest of the day, and so he takes his dog and fishing tackle, and goes to the water; at 2 o'clock, the dog, which is behind the master, has been caught with the hook by an attempt to throw in his line; at 3 o'clock he and the dog are all straightened out again, and the line is in the water; he has both hands on the pole, and his foot braced on a stump by the water's edge, as though he had a tremendous bite; at 4 o'clock this man has got a big fish on his line, which has pulled him off his feet, and he falls on the dog and doubles him all up, but the man is holding fast to the pole, which is bent almost double; at 5 o'clock he is all straightened out again; his pole is thrown across his shoulder, and with his fish in the other hand he starts out for home, the dog following behind with his head hanging down, being all tired out. The man's name is also painted in the center of the dial in rustic letters.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

FROM SUTTER CREEK.—Cor. Amador Ledger, Feb. 25: The mines in this vicinity are looking well. Payday at the Wildman came this week, getting quite a little sum into circulation. The mill is running regularly, and the rock that is being crushed, from the 400-foot level principally, is of excellent quality. The Iowa is running steadily, and a good cleanup is looked for in a few days. The Lincoln mill is said to be looking well. They will have a cleanup in two weeks. The 800 feet of 15-inch pipe to run the compressor for the South Spring Hill is all delivered, and men are at work placing it in position.

SOUTH SPRING HILL.—Ledger, Feb. 25: At this mine they have made an important improvement in the utilization of power for running the air compressor. The air compressor has been placed in position at a point opposite to the planing-mill and ice factory, just above the reservoir. By this means all the water necessary to operate it can be had at all times, at a trifling cost, as, of course, it is again returned to the ditch immediately. From the air compressor a four-inch pipe is run to the mine, a distance of 3400 feet, to convey the power. This arrangement will save at least \$100 per month, besides enabling the compressor to run at times when water is scarce, which heretofore it has not been able to do. It is said, also, that even the mill can be run by this power.

MISCELLANEOUS.—At the Keystone, sinking operations were commenced last Monday. It is intended to go 300 feet deeper. The mill will be kept running as usual while sinking is being prosecuted. At the Kennedy, the work of putting up stronger hoisting machinery over the north shaft is progressing. This shaft is down over 500 feet, and the old works were not equal to going much further; so it was decided to put in the necessary machinery to carry the shaft as deep as the south shaft while the men were finishing retimbering and enlarging of the shaft, which will take a month or six weeks to complete. By that time the hoisting works are expected to be in running order. They will be fitted for either steam or water power. The shaft of the North Star is down 250 feet; about the same depth as when the direction of the shaft was changed some two months ago in order to avoid the hard greenstone. The bottom is in coarse slate, with small stringers of quartz occasionally to be met with. We are informed that the first cleanup of the Wildman mill gave an average of between \$10 and \$11 per ton—a yield which eclipsed the most sanguine expectations. The mill is to be enlarged to 20 stamps. Mr. Holland, an expert in the treatment of base gold-bearing ores, was in Jackson last week, examining the peculiar ore met with in the Middle Bar region. He claims that he can save over 90 per cent of the gold contained in the black metal and other quartz of that district. Water-power hoisting works are being erected over the south shaft of the Amador gold mine. The works are said to be similar to those over the other shaft.

## Butte.

ARASTRAS.—Oroville Mercury, Feb. 24: A correspondent at Enterprise writes the Mercury that Jo Meacham's quartz mine is now running two arastras, day and night, that are crushing \$9 ore, and he has no end of it in sight. Only three men are required to furnish ore. We are much pleased to hear such good reports from our friend Meacham's mine. Our correspondent also states that Messrs. Rutherford and Hallam of Oregon have purchased and commenced working an old ledge that once paid very largely. Mining is looking up in the Enterprise district, and no doubt that old mining camp will yet recover some of its former mining fame.

## Calaveras.

QUARTZ MINES.—Prospect, Feb. 24: One of the most promising quartz mines in the central part of the State is the Tiger mine at Rich gulch, this county, the property of the Ilex Gold Mining Co. of London, England. The owners of this mine for the past two years have been expending large sums of money in the development of their property. Several deep shafts, numerous tunnels and drifts and crosscuts have been made with the result of showing up a vast body of ore. The pay rock is exceedingly rich and has every appearance of extending to a great depth. The Risdon Iron Works of San Francisco have taken a contract to erect a 40-stamp mill up in this mine to be completed as soon as possible. It is expected that this mill when complete will be one of the finest and best-equipped mills on the coast, and will be able to pay running expenses of the mine with rock that will mill \$2 per ton. The mines situated near San Andreas have received new impetus in the past few months. Old abandoned claims are being reopened and all the quartz crupings in the vicinity are being prospected. The Mohawk mine, one and a half miles from the county seat, upon which work was shut down several years ago, has been purchased by a wealthy company and active operations commenced to develop its hidden treasures. Upon the success or failure of this mine hangs the fate of a number of other mines and claims upon the same lode. For a number of miles this lode crops out to the surface, and each cropping prospects well, free gold and high-grade sulphurets showing in the quartz. At West Point, Mokelumne Hill, Murphys, Copperopolis, Campo Seco and other parts of the county prospecting is being carried on to an extent hitherto unknown in the history of the county. The attention of Eastern and English capital is rapidly being drawn to this great bed of mineral deposits, and mining is yet but in its infancy in this historical county.

ATTACHED.—Calaveras Chronicle, Feb. 25: The Leavitt mine, just above the Big Bar bridge on the Mokelumne river, recently worked by G. W. Campbell & Co., has been attached by Constable Goodwin of this place in the interest of several creditors here. Hardenburg & Pilcher, well known in San Francisco, are part owners in the mine. Messrs. E. Vandell and G. Gama, a couple of young men of this place, have purchased the tailings from old Corral flat gravel mine, which they intend washing over again. A rich strike has been made in the new

shaft at the Cleveland mine near Big Bar. The new shaft is 300 feet west of the old one. A contract has been let for the erection of a 40-stamp mill on the Ilex mine at Rich gulch.

WEST POINT.—Angels Echo, Feb. 22: The mining outlook at West Point is very flattering and the mines now in operation there are all yielding good returns. Extensive developments will be made in many of the mines in that section as soon as the weather gets fairly settled. The prospect for West Point becoming prominent among the leading mining towns of the State was never brighter than at present.

ILEX.—We are informed that the Ilex mine at Rich gulch flat is immensely rich, and that extensive improvements are now being made on the property in the way of erecting heavy machinery. Considerable money has been expended in the purchase of new machinery for this mine of late, and as soon as the machinery is got in running order, extensive developments will be made in the mine.

UTICA.—The machinery for the construction of the new hoisting works on the Utica mine in this place is now on the ground. It is said that the engine is the largest ever brought to Angels.

ANGELS.—Several strangers, said to be capitalists from Boston in search of mining property, were in this town during the week. These gentlemen could not find a safer place for investment in mining property. Capitalists and mining men have been quite numerous in Angels during the past week. They are unanimous in their expressions as to the very promising and flattering outlook for this section.

SHEEP RANCH.—The Sheep Ranch mine, owned by Hearst & Haggin, and situated at Sheep ranch, is now 1000 feet in depth. This is the deepest mine now in operation in Calaveras county.

REED.—The bedrock has been reached in the Reed mine at San Andreas, and it is reported that the gravel prospects well. Judge Reed has labored long and energetically to tap the gravel channel of this mine, and we hope he will be richly rewarded for his efforts.

## El Dorado.

FOUR-FOOT LEDGE.—Placerville Observer, Feb. 27: The Tincup Mining Co., two miles south of Placerville, have their tunnel in 400 feet, and have struck a four-foot ledge of fine-looking ore.

BIG TUNNEL.—The contractors in the Big Tunnel have thrown up their contract, and the tunnel is now being pushed ahead under the active management of Supt. McNeal.

CEMENT.—The Chili Ravine Placer Mining Co. have made a crushing of cement gravel in their mill, which resulted satisfactory. They are now running a side drift from their main tunnel to strike rich flats or old river bars of gravel believed to exist in the hill. H. W. Roberts, superintendent of the Carrie Hale mine at Henry's Diggings, returned from San Francisco on Saturday. They have their tunnel in 400 feet and will now commence breasting out pay gravel. Their future is promising.

## Nevada.

RICH STRIKE AT THE DELHI.—Nevada Transcript, Feb. 25: E. Spafford of the Delhi mine near Columbia hill was in town yesterday. A deposit of the richest ore ever found in the Delhi was struck Thursday. The quartz contained so much gold it was with great difficulty removed from the ledge, and in pulling it out there followed it stringers of solid gold from six inches to a foot long. A few tons of it would be enough to make every person in the county rich were it divided among generally.

A GOOD PROSPECT IN THE CROWN POINT.—Grass Valley Union, Feb. 26: At the time that the ice blockade shut off the water-power from the mines some weeks ago the second, or 300-foot level of the Crown Point mine was filled with water, but the pumps were got to work again in time to hold the water below the first, or 180-foot level, upon which level since that time the work has been done, and the north-west drift from the shaft has been extended until it is now 250 feet in length. For some distance the walls have been from 12 to 14 feet apart containing ledge matter and a talc formation, which has not yielded much per ton, but a crosscut made within a few days has exposed a solid vein of quartz, two feet in thickness, which shows well in free gold, and will make handsome returns in the mill. To all appearance it is going to be continuous, and is considered one of the best discoveries that has been made in the mine. There has been nothing like it since the rich specimen rock was taken out about a year ago, and goes to prove that the Crown Point only requires the proper development to become a regular dividend-paying mine.

PROMISES TO BE A BONANZA.—Grass Valley Tidings, Feb. 25: The rich ore strike at the Pennsylvania mine, reported by the Tidings recently, still holds out and is even richer than first announced. Very high-grade quartz, well worthy of being denominated "specimen ore," was extracted yesterday and to-day. The vein all through is of high grade and of good size—two feet on an average, as understood. At the Pet gravel mine the water has been pumped from the shaft and the sinking of a 10 or 15 foot sump is under way. It is expected that on Tuesday next the extracting of gravel will begin.

ALPHA AND GOLDEN GATE MINES.—These properties adjoin the Idaho on the northeast. Samuel George, Sr., and Wm. H. George are the lessees. Work has been going on for several months at the Alpha and in this period water-power has been introduced from the Idaho system and Pelton wheels put in for hoisting and pumping purposes and for running the five-stamp mill on the property. The shaft is now 200 feet deep and there is a five-foot ledge of low-grade ore in the bottom. Sinking is still in progress, and when new drifts are opened up a 20-stamp-mill can be kept steadily at work by adding two or three men to the force now engaged. Though low grade, the ore is of uniform quality and warrants further developments. Thos. Poyzer of Alameda and James F. Rowe of this city are the principal owners of the Golden Gate claim, which is located on the same lead as the Alpha. Abram Bros. are the lessees of this property, and now have a crushing of ore at Rodgers' mill.

## San Diego.

STRUCK IT RICH.—Pasadena Union, Feb. 25: A letter received by S. B. Tubbs from his partner, John Peterson, who is at work on a gold mine owned by them in the Carga Muchacho mountains,

near Yuma, says they have struck it rich in a new shaft. Three feet of gold-bearing quartz has been developed, which will pay handsomely. Samuel Brown, who is also well known in Pasadena, is at work with his two partners on an adjoining claim and are developing a vein of gold-bearing rock. These mines are located six miles from Oglesby on the line of the Southern Pacific, and are less than a mile distant from the famous Carga Muchacho mine, which was sold for over \$500,000, and which gave the county such prominence in mining circles a few years ago.

## Shasta.

FROM WHISKYTOWN.—Cor. Shasta Courier, Feb. 25: J. S. Strode has commenced operations on his Dog gulch mine, and will make that section his headquarters. John K. Williams has plenty of water and is making the gravel fly in good shape.

## Sierra.

ST. LOUIS.—Cor. Mountain Messenger, Feb. 25: The Riffe Mining Co. have a very good prospect in the upper tunnel, and employ about 8 men. The Wahoo tunnel is not running very steadily at present on account of some machinery giving out, and lack of water. The Excelsior new tunnel is progressing finely, the boys having run about 350 feet. The company expect to strike pay-gravel in a few hundred feet more.

THE MOUNTAIN LEDGE.—This ledge is owned almost entirely by O. Sunderhaus, part owner in the Young America. Mr. Sunderhaus purchased the property from H. Warner, and is on the ground looking to its thorough development. The ledge is situated about 3 miles from Sierra City, and one mile west of the Young America, near the same elevation. Twenty-five men are working in and around the mine. No. 1 tunnel is in 400 feet, and, at that point, is a splendid ledge, from 7 to 10 feet wide, that all prospects very rich and shows a great deal of free gold. Tunnel No. 2 has just been started, and will be driven ahead as fast as possible; a 40-stamp mill will be running by the last of August. Billy Casserly is superintendent, and, though young, has the reputation of being very efficient in managing a mine. This ledge, by all accounts, is one that will equal, if not excel, the richness of the Young America.

ENCOURAGING DEVELOPMENTS.—The gravel in the Wide Awake main tunnel, in 700 feet, was down, at last accounts, half-way—3 feet—from the caps at the face, heavy wash, blue-colored with soft, black slate-swelling bedrock. The gold found is very coarse; the largest nugget, after cleaning up one box, weighed a half-ounce. A breaster, 150 feet from the face, is realizing \$10 a day. A well-washed quartz boulder required a week's blasting before being removed from the main tunnel. Bedrock is still pitching a little. Until water season opens further development will progress slowly. Supplies are laid in sufficient for 7 men until the 1st of June or later.

PIKE CITY.—Mountain Messenger, Feb. 25: Pike City is a very dull town. About 90 men have gone to work out of 120 of the strikers. John Nelson has been appointed receiver, and Col. Bates and Mr. Nelson have gone to the Bay and are expected to return in a week. The miners are promised a payday on the 10th of next month, and everybody here hopes they will have it, as coin is badly needed in Pike City. The miners say the mine looks well and don't see why there is no payday. The Sunflower Co., at Pike City, are going to put on a double shift the 1st of March. Their tunnel is in 190 feet—as fine as there is in the county—300 feet from the shaft, 80 feet deep, ledge extending from top to bottom; widening the deeper they go, and the rock prospects well.

PAGE LEDGE.—The old Page ledge, up Sailor ravine, owned by Sam Baker and J. Cowden, is very promising. They have found it on the surface and in several short tunnels. It is at present about four feet wide, and where found, always prospects thoroughly well in free gold. What is in sight, with some kind of machinery, would yield good wages. The ledge has a good backing in the direction of and under the mountain toward the old Excelsior gravel claims.

## Tulare.

GRAPHITE.—Tulare Times, Feb. 22: Graphite, or black lead, has often been found in small deposits in the mountains to the east of this city, and at one time a mine of this mineral east of town had considerable work expended on it. But the deposit was too small to prove profitable in working it and the business was abandoned. Lately a more extensive deposit has been found, where several tons a day can be extracted, and its locators propose working it if they can find a profitable market for what they can deliver in this city.

## Tuolumne.

BIG STRIKE.—Sonora Democrat, Feb. 25: It is reported that an immense bonanza has been discovered by Messrs. Kinney and Hastings in their mine above Yankee Hill. The exact amount is not known as yet, but enough has been learned to place it way up in the thousands. This is another case where success comes after many years of privation and labor.

BIRNEY MINE.—This mine, above Columbia, has never at any time looked so encouraging as it does at present. A large body of ore has been uncovered and experts say that it will pay \$20 per ton. With good weather and everything to facilitate operations, there is no reason why the next few months should not give forth immense results.

BALD MOUNTAIN.—The pocket miners of Bald Mountain are doing well, and large amounts of gold are coming forth. May the old mountain continue to yield to its workers, and may it never become half of the golden treasures.

EXPERIMENTAL MINE.—The above mine, near Columbia, is now doing splendidly, and the owners thereof are in excellent spirits concerning its ultimate great success.

NEW ALBANY MINE.—Those enterprising young men, Messrs. Kirk and Long, who some time ago leased the New Albany mine of Dr. Walker, have, we understand, made a splendid and gratifying development. Some of the rock is quite rich in free gold, and all the quartz that we have seen is of good gain and of a superior structural character. At present it is impossible to give a clear, succinct account of the value of the ore, or the magnitude of the chutes. It is, however, sufficient for the present to state that should the present find hold out as it is now, Tuolumne county will yet have a bonanza

of such character and value that the eyes of the Pacific Coast will turn with amazement toward this mine in the rugged wilds of the Tuolumne river. We expect a full account shortly.

## NEVADA.

## Washoe District.

UTAH.—Enterprise, Feb. 25: On the 472 level the incline upraise in west crosscut No. 2 has been carried up 15 feet; total height on the slope, 60 feet. Owing to an excess of water in the face of the upraise, work at this point has been temporarily suspended. It is thought that the water will soon run down. The face of the upraise is still showing quartz and vein porphyry. Opposite west crosscut No. 2 have advanced east crosscut No. 3 12 feet.

HALE AND NORCROSS.—On the 400 level the south lateral drift has been extended south 60 feet and continues in fair-grade ore on the east side. Are merely skirting the ore body. In the north drift on this level the west crosscut has been advanced 50 feet in vein material. On the 700 level in the south upraise are 109 feet above the track-floor, and have started a drift from the top of this raise to connect with the north raise. It is out 15 feet and continues in the same quality of ore. From the north upraise are driving a south drift to connect with the north drift; it is out about 13 feet in fine ore. All the stopes show the usual grade of ore. Are shipping about 50 tons a day to the Vivian mill. Have about \$25,000 of bullion on hand.

CON. CAL. AND VIRGINIA.—The stopes at the bottom of the winze sunk below the 1435 level are still yielding large quantities of ore of high grade. The prospecting drifts on the 1600 and 1650 levels are showing quartz that is beginning to carry some metal. The usual amount of ore has been shipped to the Morgan and Eureka mills, on Carson river, during the week. The battery samples are running about the same as last week.

SAVAGE.—On the 400 level the north drift has been connected with the upraise from the 500 south drift. This connection increases the ore-supply and adds to the ventilation. On the 600 level are stoping ore north and south of the shaft. On the 750, 850 and 900 levels the usual quantity and quality of ore is being stoped. Are shipping about 140 tons a day to the Mexican mill. Have bullion on hand amounting to about \$54,000.

BEST AND BELCHER.—On the 425 level the main north drift has been extended 25 feet; total length, 525 feet. The formation continues to be porphyry and quartz. Upraise No. 1, started at a point 130 feet south of our north line, has been carried up 20 feet; total height, 70 feet. At this point have cut the west clay and have started a west crosscut. The formation is a mixture of clay, porphyry and quartz.

GOULD AND CURRY.—On the 250 and 300 levels are still extracting ore. Have extracted during the week 140 tons of fair-grade milling ore, which is stored in drifts in the mine. On the 1300 level the south drift from the east drift has been extended 46 feet; total length, 336 feet. The formation is soft porphyry and clay, showing some water.

OCCIDENTAL.—In No. 1 upraise, 35 feet above the upper tunnel, a south drift has been advanced 15 feet. On the 100 level No. 2 upraise in the east crosscut, north of the raise, the north drift has been extended 11 feet; total, 63 feet. On the 200 level, 65 feet below this level, the north drift has been extended 8 feet; total, 24 feet. Have extracted from the mine 58 tons of fair-grade milling ore.

BELCHER.—The usual progress is being made in the crosscut on the 400 level. There is no change of material. On the 500 level the south drift continues in vein material of a favorable quality. The flow of water has considerably decreased. The drift to connect with the Suro tunnel is still being pushed ahead.

ALPHA, IMPERIAL AND EXCHEQUER.—The face of the northeast crosscut on the 122 level is in quartz that shows some metal. On the 222 level the north lateral drift continues in low-grade quartz. On the 382 level the south lateral drift is still in ore of fair grade, and the north drift is in quartz that yields low assays.

CHOLLAR.—The north drift on the 550 level is still showing good milling ore. The north drift on the 450 level is showing bunches of good ore. The south drift from the Hale and Norcross on the 400 level, which is now in Chollar ground, is being driven alongside the vein.

POTOSI.—Ore is being extracted from the 250, 350 and 450 levels. The usual amount of prospecting work is being done, and ore is being shown up at several points, at some of which large and valuable deposits are liable to be found. The battery samples average about \$25 a ton.

ALTA.—Are running prospecting drifts alongside the vein on the 725, 825 and 1150 levels. Good streaks and bunches of ore continue to be found in the upraise in the Keystone from the 725 level. The mill will shortly resume crushing ore.

OPHIR.—The fine body of ore (35 feet in width) developed on the 1465 level continues to improve as opened up. It will prove a very productive and valuable deposit.

WEST CON. VA. AND CAL.—Good progress is making in sinking the main shaft. Since the melting away of the snow there has been no trouble with surface water.

ANDES.—The usual progress is being made in the several prospecting drifts, and some streaks and bunches of ore are occasionally encountered.

SEGREGATED BELCHER.—On the 1300 level the south drift from the upraise is in vein porphyry that shows some streaks of quartz and seams of clay.

SCORPION.—Are drifting north and south on the 300 level. The north drift is out 120 feet and the south drift 85 feet.

BENTON.—Are drifting on the 725 level. The material is vein porphyry with streaks of quartz and some clay.

MEXICAN.—West crosscut No. 2, on the 1300 level, is still in vein material which shows some metal.

BULLION.—The usual drifting and prospecting work is in progress.

UNION CON.—West crosscut No. 2, on the 1300 level, is still in a soft formation of porphyry.

SIERRA NEVADA.—The south drift on the 520

level is still in a vein material composed of quartz, clay and porphyry.

#### Battle Mountain District.

**GALENA.**—*Silver State*, Feb. 27: At Galena, which is situated in Battle Mountain mining district, work has been resumed at the mills, which were shut down in consequence of the scarcity of water during the unprecedented cold weather in January. Two companies, which mean business and understand mining operations, are at work. These are the Blanco G. & S. M. Co. and the Bunker Hill G. M. Co. They have opened their mines in an extent that has assured them an unlimited supply of ore for an indefinite period.

#### Eureka District.

**ORE SHIPMENTS.**—*Sentinel*, Feb. 26: During the past week ore shipments were made from the mines of the district as follows: To the Richmond Company—Dunderberg mine, 16 tons; Leone, 5; Jackson, 37; General Lee, 4; Wide West, 1½; Silver Lick, 25; Bullwhacker, 3; Williamsburg, 7. Eureka Con.—Hensley, 1 ton; Jackson 30 tons; Silver Lick, 10.

#### Dun Glen District.

**THE NEW MILL.**—*Silver State*, Feb. 23: J. V. McCurdy, who recently purchased the Lang Syne mine at Dun Glen, which will henceforth be known as the Lang Syne Mill & Mining Co., has commenced work on the new mill. A force of men under the supervision of J. L. O'Donnell, an experienced millwright, is now framing the building. A part of the machinery has arrived, and they expect to have two mills running before April 1st. The capacity of the new mills will be about 70 tons a day, and with the mill now in operation about 85 tons of ore a day may be reduced. The mine is developed to such an extent that it can be made to produce an unlimited quantity of ore, and it will be worked exclusively for gold.

**GOLD BULLION.**—J. V. McCurdy shipped bar No. 1 from the Lang Syne mine at Dun Glen Tuesday. It was gold and worth about \$14 per ounce. It is greatly to be hoped that similar bars will continue to be shipped regularly, as the mine gives employment to quite a number of men.

#### Gills District.

**THE STAR MINE.**—*Walker Lake Bulletin*, Feb. 23: The shaft of the Star mine is now down 90 feet. There is good ore at the bottom and there is a quantity on the dump which has been taken from the shaft since the last shipment. The 100-foot level will be reached this week, when a drift will be started.

#### Marietta District.

**LOOKING WELL.**—*Walker Lake Bulletin*, Feb. 23: The mines of Marietta district are looking better at the present time than for many years past. Indeed, I doubt if there has been at any time in the past as good a showing for the number of men at work. Several carloads of high-grade ore are now ready for shipment, only waiting for the snow to go off sufficiently to allow it to be transported to the railroad. The Endowment, through the intelligent prospecting of Messrs. Smith & Means, is showing up finely. High-grade ore and plenty of it. The Big Buffalo, owned and worked by McClellan & Bradley, shows steady improvement for each day's work done on it. The ore is rich and the ledge strong and well defined. M. M. Comstock is making a good showing on the Champagne. He is all ready to make a shipment as soon as the state of the roads will admit. F. Maguire is taking considerable lead ore from the McDonald; Frank is a stayer from "away back." Tom Mackey is also getting considerable lead ore from the Rip Van Winkle. Messrs. Cook & Peterson are taking rich ore from the old Sunset mine. This is one of the most promising locations in this section. Several copper mines in this vicinity will certainly be worked the coming spring if copper holds up to the present quotations.

#### Tuscarora District.

**NAVAJO QUEEN.**—*Times-Review*, Feb. 24: Are now putting in station timbers on 200-foot level. Total depth of shaft to date, 206 feet. Progress during the week, 6 feet.

**BELLE ISLE.**—The prospecting of the old stopes on 250-foot level is developing some good ore.

**PONDERE.**—East crosscut has been extended 16 feet since last report; total length, 137 feet. Have cut a ledge 3½ feet in width, which looks remarkably well.

**GRAND PRIZE.**—The stopes are producing, and looking well. Average pulp assays for the week, \$205.37. Everything at mine and mill running all right.

**NAVAJO.**—South drift from No. 1 upraise on west lateral vein has been extended a total distance of 75 feet. The face continues in good ore. No. 2 upraise is up 25 feet.

**FOUND TREASURE.**—Southeast drift, 150-foot level, has been advanced 15 feet; no change of interest in the vein. Stop above No. 1 chute is yielding high-grade ore in fair quantity; average of ore taken out during the week, \$535.40 silver, \$72.34 gold; value per ton, \$707.74. An upraise has been started southeast of the crosscut to connect with the winze on the 200-foot level, and has been carried up 8 feet, showing high-grade ore all the way.

**NORTH BELLE ISLE.**—North lateral gangway, 400-foot level, extended 25 feet. The face shows seams of high-grade ore, and there is quite an increase in the flow of water; total, 122 feet. The usual output of ore has been made during the week. The settler at the mill that gave out last week has been replaced and started up last night.

**COMMONWEALTH.**—On the 150-foot level, No. 1 drift has been advanced 18 feet. An upraise was started near the face and has been passing through low-grade ore the last 15 to 16 feet, giving assays of from \$18 to \$172 per ton. This upraise is west of the main shaft 72 feet. The vein being so flat it would be a long distance to run before reaching the ore, so this upraise was put up to prospect the ore body. A crosscut is being run west from where the upraise was started, and will cut the ore on the level, but has considerable distance to run yet. North drift from 150-foot level station has been advanced 20 feet in vein formation. An upraise has been started near the face, and last night cut into very rich ore which has every appearance of being large. This is the same ore that was followed north by the north drift on the 200-foot level, and as the ore

dipped below the bottom of the drift on the 200-foot level, work was discontinued.

**NEVADA QUEEN.**—Winze on east vein has been sunk 12 feet; bottom all ore; have had to stop, there being too much water to hoist with a windlass. The north drift has been advanced 17 feet. The ore taken from this drift during the week has been high-grade, and will mill over \$300 per ton. Face of drift is now all in ore, and is better than at any time heretofore.

#### Wild Ross District.

**PARADISE VALLEY.**—*Silver State*, Feb. 27: Ore produced and delivered to the mill, Paradise mine, 89,500 pounds. Average assay value in ounces per ton—silver, 10.85; gold, 0.68. Mill run 168 hours, lost no time and reduced 35 tons of ore and 70 tons of tailings. Concentrates produced 336 sacks, 23,178 pounds, per value \$2282.17, which were shipped to the Selby Smelting and Lead Co., San Francisco, Cal. Mill work—Three Huntington centrifugal roller-mills and six Triumph concentrators. Number of men on pay-roll, 46. The upraise, north drift, Wild Goose, lower level, shows a slight improvement in size of vein and value of the ore. Everything running steadily at the mill and mine.

#### ARIZONA.

**NOTES.**—*Prescott Courier*, Feb. 23: Thirteen sacks of ore from Smith & Bigelow's new mine have been received by Geo. W. Sines. It samples \$89.40 per ton—\$49.95 in gold and \$41.55 in silver. Mr. Osenburg, just from Bradshaw district tells of fine ledges there. He found Mr. Long, foreman of the O-o Bella Mining Co., pushing work on the company's ledges. His men were tunneling and drifting. Men employed by the Moody & Place Co. were working in very rich ore. Ore from Ben Rybon's Ruby mine in Walker district, assays big in silver. George Ropeter has sold one-half of his claim on the Biggs lode to a Prescott gentleman of means, and the work of development will now go on. Pack trains, with ore, arrived at the sampling works yesterday. The Schofield mill, Big Bug district, is being put in condition for work by Mr. Cartmell. John S. Jones, manager of the Standard Milling and Mining Co., has about 100 tons of ore in the bins, and will start his mill to-day or to-morrow. Frank Alters, one of the owners of the Catoctin mine, is here, shipping ore. Ed Wagoner has gone over one-third interest in the lease of the Lynx creek hydraulic mines, and has gone to work in the mines. We see it stated that the Silver King mine of Pinal county, this Territory, has paid in dividends the large sum of \$1,192,000. Mr. N. Ellis, manager of the Clarecote-Ruby mine and mill, arrived at his home in this place yesterday. He has men and teams engaged hauling timber to the mine.

**RICH ORE.**—*Florence Enterprise*, Feb. 25: The Bunker Hill district, 12 miles east of the Mammoth camp, has long been famous for its rich ores and many of its mines are very valuable. A mill or smelter could do a fine custom business there. Among the exceedingly promising prospects are three owned by Mr. I. Hinderliter, who is occasionally made a shipment of ore from which really handsome returns have been received, the lowest being \$398 per ton and the highest \$999.75. Of course, this was selected ore of the best description, but it demonstrates the fact that the mines contain something worthy the attention of mining men. Wood, water and limestone and iron fluxing are convenient to the mines and the ore could be smelted at a minimum of expense.

#### COLORADO.

**SILVERTON.**—*Miner*, Feb. 22: The Lackawanna begins shipping 10 tons per day on Monday. The Sunnyside Extension is working 12 men and has a large amount of ore on the dump. The Belle of the West and the Vanderbilt, two Red mountain mines, are sending in regular daily shipments to Silverton. The Emerald boys are still pegging away and will have a nice bunch of ore to ship in the spring. The great crosscut on the North Star on Sultan will reach the vein in March. Over 100 men will be required to work the North Star the coming season. The North Star on Solomon on Wednesday of last week had as much ore out as was extracted up to the 10th of May the year previous. Had the open winter been expected, shipments would not have been suspended at all. The trail is now nearly bare, and two men could open it in a week. The North Star will more than double its usual output this year. The lessees of the Whale made a rattling good strike in the lower level the fore part of the week, which will, if it holds out, amply repay the boys for their winter's labor. The *Miner* has received a letter from Mr. M. M. Engleman of Canyon City, one of the owners of the Sunnyside mine, in which he states that he will arrive early to start work on other mines near Eureka of which he is owner, and possibly the erection of a large concentrating mill. He has been in the mining business for 16 years and thinks the San Juan is the richest district he has ever seen in America. There is much interest manifested on the outside in the Silverton district, and he expects that many of our mines now idle will be started up next season. There is a vast empire of territory near Silverton that offers unparalleled inducements to the prospector. It is a domain of treasure that has most unaccountably been overlooked in the mad rush of early days in the mistaken idea that large croppings of quartz and a rich vein are never separate. It is doubtless owing to the dearth of large quartz croppings in the immediate vicinity of town that so little prospecting has been done. There is the same formation, the same characteristics of rock, and we are convinced that better, richer float, and more of it, cannot be found elsewhere in the county than around the foot of the mountains bordering on Baker's park. There is no other way to account for the neglect of this seemingly rich country except the absence of croppings; that the ground is rich in mineral has never been disputed, and we predict that the time is not far distant when the ground indicated will be the real beehive of the San Juan.

**LEADVILLE AND ASPEN.**—*Denver Republican*, Feb. 23: Leadville and Aspen are by all odds the leading producing mineral sections of Colorado, and are now running a pretty race for first place in the value of the output of their mines. Leadville has taken no backward steps, but on the contrary has advanced considerably in the number and strength

of her great ore chutes, besides adding to the limits of her resources to the north, south and west. Aspen has sprung into her greatest prominence within the last six months by the richness of her ore bodies in old as well as new properties. The grade of her ore is higher than that of Leadville and the bulk of her deposits are fairly rivaling those of the latter. One year ago Aspen was merely striving for second place without much thought of measuring strength for full rivalry, but now there are many who think she can eclipse Leadville within the next two years, both in richness and bulk of ore. This is a marvelous change, but it must be borne in mind that it is no wise detracts from the intrinsic worth of Lake county mining properties, but merely demonstrates the greater extent and probabilities of Pitkin county's resources.

#### DAKOTA.

**HOMESTEAK.**—*Black Hills Pioneer*, Feb. 22: Concerning the proposed change to steam-stamp at the Homestake, the only question to be considered is whether the stamps will crush fine enough to amalgamate. There is no question as to their economy or efficiency, both having been fully tested. With the same power very much more ore can be milled, and hence a corresponding increased number of men employed. Should the experiments now being made prove successful, the company will undoubtedly make the change.

**RUBY BELL.**—Close calculation of the value of ore in sight in the Ruby Bell mine, fixes it at \$260,400. A continuous body of ore 124 feet long by 14 feet deep has been disclosed by actual development works. The average value of the ore is \$25 per ton, and it was on this basis that the calculation was made.

**MUTUAL.**—Excellent reports from the mine were current on the streets of Deadwood yesterday and the day before. It is said that the ore body has been explored over 30 feet, and that its dimensions appear to be increasing rather than diminishing. The average value of the ore, as shown by assays recently made by Mr. Terhune, is \$27 per ton, gold. Chief importance attaches to the find by reason of its occurring beneath the lime contact, which by general consent had previously been supposed to mark the depth at which ore would be found. The U. S. Grant, B. G. Hill and War Eagle companies are each likely to profit by the discovery, as the southeasterly trend of the vein must carry it through their ground.

#### MONTANA.

**SOME FINE ORE.**—*Inter-Mountain*, Feb. 21: E. H. Irvine and Bryan Irvine are feeling pretty good over a late development in the Narrow Gauge. In the ore body which they are opening they have a streak of high-grade ore which is from 10 to 12 inches wide and assays something over 300 ounces to the ton.

**THE QUARTZ PLACERS.**—*Salt Lake Tribune*, Feb. 24: John Groesbeck, who is interested in the placer claims on Quartz creek, in Missoula county, Montana, about 50 miles below Missoula City, left last Sunday to spend the summer there in mining. In a few days his brother, N. Groesbeck of Springfield, will start to join him in this enterprise, and will take five or six men with him, one of whom is a sawmill man, to operate a mill to manufacture lumber for flumes. A force of men have been working on the claim for some time, making a cut through a point of the bar where the gravel is 150 feet deep. The cut is over 100 feet deep, and colors were found all the way from the grass roots down. At the bottom of the cut, where it is over 40 feet above bedrock, the gravel shows six or eight colors to the pan. John Snell of this city, who is one of the owners of these placers and who spent last year there, is very enthusiastic over the prospects of the company in their work this season, but as John Groesbeck has gone to take charge of the work, Mr. Snell will remain here and engage in his old business as a contract builder. These placers are so situated as to have convenient plenty of water and timber, but are of such character as to require large operations, which the company have provided for in their preparations for working.

**SAN FRANCISCO CON.**—*Phillipsburg Mail*, Feb. 24: The shaft now has a depth of 358 feet. At 300 feet the vein turned slightly and took a more vertical pitch, and the shaft being continued at the same inclination as before is now in the country rock south of the vein. Occasional crosscuts show the vein to hold well in width.

**WEST GRANITE.**—At the 400-foot level of the Rattlesnake an extra pump has been placed in position and is now operating actively, which places the water well under control and has enabled work to continue. The vein continues to make to the north.

**GRANITE.**—The output for the week ending February 18th was 36 bars, containing 60,703.60 ozs. fine silver, and 33.41 ozs. gold.

#### IDAHO.

**A NEW ERA ON WOOD RIVER.**—*Times*, Feb. 22: The purchase (or bonding with privilege to purchase, which amounts to the same thing in this case) of the Idahoan mine by the Alturas syndicate of English capitalists, will mark a new era on Wood River. Such a powerful organization as this will not rest content with one "lead" property. Having touched that class of mines at all, it will not stop with one purchase, but doubtless stand ready to take hold of any promising mine which may be offered in this vicinity at reasonable figures. This will greatly stimulate claim-owners, who will know that if they cannot secure the capital to properly develop their properties, they can at least sell them for something like their actual value, and this will inspire other capitalists with confidence in our region, and lead them to invest here. With Craig Chambers and Prof. Jenney operating the Dorango and Bullion-Ophir groups, the Alturas syndicate at the Idahoan, Colonel Thompson at the Rising Sun, Charles Popper at the King of the Hills, Mr. Venable at the Red Cloud, Messrs. Flannery and Burns at the War Dance, the Red Elephant Co. at their group, and the number of other competent mine-managers in the district, Bullion and vicinity would boom this summer as it never did before.

**SIGNS OF THE TIMES.**—*Wardner News*, Feb. 25: There are unmistakable signs from all quarters that the anticipated boom this season in Coeur d'Alene

will prove no romance, but will make itself plain in stern reality. The season opens most auspiciously and the latest reports from abroad are most satisfactory. In the great business centers of the East, money is plentiful and every man or corporation that needs capital can obtain it on strong collateral. Many are taking advantage of the plenitude of cash and unhesitatingly say that the great amount of idle capital will soon be diverted to speculative securities and good and safe investments. It is certain when the season is fairly opened the market will feel the impetus and everything will be lovely. We will witness many changes, some reorganizations, and it is well known that numerous important schemes are on foot, the development of which will have a remarkable effect on our community and enliven matters wonderfully.

#### WASHINGTON.

**BOUND FOR SALMON RIVER.**—*Ellensburg Capital*, Feb. 23: Those who believe it is only the early bird that catches the worm are now outfitting in Ellensburg for Salmon river and the Big Bend. The fine weather is causing the tide of immigration to set in early, and the indications are that fully 10,000 people will go to Salmon and the Big Bend this year. As all are possessed of some means, and as the mines will begin to give returns, flush times may be expected this year. The merchants of Ellensburg, who did a large business with Salmon river last year, expect to double their trade this year, and the indications now are that they will not be disappointed.

#### NEW MEXICO.

**KINGSTON.**—*Shaft*, Feb. 22: The mines of Kingston are becoming known in all mining circles from London to California, and people are becoming interested at all points between. Some of our citizens are in communication with capitalists who are becoming interested in some of the most valuable mines of our rapidly rising empire. G. W. Chase and Jim Dennis have good ore on the Signal, adjoining the Charm on which Hume has made the new strike. The Tierra Blanco is looking up. This is on the south end of the Kingston belt; \$95 ore—this means both gold and silver. The new strikes are down that way as well as on the north.

#### OREGON.

**GRANITE CREEK.**—*Bedrock Democrat*, Feb. 20: From Dr. A. J. Thibodo, who returned from the Granite creek district last Wednesday evening, whither he went to look after mining interests, we glean the following notes of progress of work in that section: Snow is fast disappearing, only about 10 inches of snow at Independence and about 2 feet at the Monumental mine. The Buffalo mine, owned by a Pendleton company, and being worked by Messrs. Pugh & Meyers, has been developed to the extent of a 40-foot tunnel this winter, the ledge vein being 10 inches in width and showing an exceedingly rich body of ore. John Cable, of the La Bellevue, reports having taken out more shipping ore this winter than ever before. Their tunnel is in 220 feet, and the pay streak of the ledge is from 4 to 5 feet in width. The Wide West, owned by Garrison, Lucas & Flaherty, and a continuation of the La Bellevue, is showing up equally as well, and a large amount of shipping ore is being taken out. I. K. Klopp's group of mines in the same vicinity are showing up well, and he, also, is taking out a large quantity of fine shipping ore. Great excitement prevails among the miners in the vicinity of Greenhorn mountain over recent very rich strikes and the encouraging outlook of all the mines. All the mine-owners of the Granite district are greatly encouraged from the result of the winter's work on their properties, and the doctor himself says that there is bound to be a mining boom in that section the coming summer, as the richness and extent of the mines fully warrant it.

**PROSPECTIVE.**—*Rogue River Courier*, Feb. 23: Tunneling is being carried on at a lively rate in the Hutch & Drew gold mine at Gold Hill, an output from which is realized about \$40 per ton in near the average work. This is decidedly encouraging to Messrs. Hutch & Drew, who feel quite elated over their good fortune. It is expected another quartz-mill will be put in some other mine in their neighborhood soon which will afford the opportunity of having the gold separated from the rock with greater facility.

#### UTAH.

**ANCHOR TUNNEL.**—*Park Record*, Feb. 25: Early Tuesday morning connection was made in the Anchor drain tunnel at a point about two-thirds of the way up from the mouth to the intermediate shaft. There was a variation of four inches in the grade and but six inches in the side lines. However, it is considered a very good connection. Now there is clear "sailing" from the mouth of the tunnel to a point about 500 feet past the intermediate shaft, making the entire distance in the neighborhood of 2500 feet, leaving 4100 feet to be driven before the future bottom of the Anchor shaft is reached. This is rapid work for a trifle over six months.

**CAMP CROSSCUTS.**—Owing to the bad condition of the road, ore shipments have been very light the past week. The Sampson's working force has been increased, and as soon as the roads get in good condition the ore shipments will be resumed on a large scale. The Story group, which is above and close to the Ontario's No. 3 works, is on the eve of making a stride to the front. Sinking in the Crescent's incline shaft has been resumed, the water pocket having exhausted itself. Word comes from an authentic source to the effect that the Dolberg group, which lies between the Morgan and Anchor and southwest of the Daly, has been sold for a good round sum to a Montana capitalist.

**ORE AND BULLION SHIPMENTS.**—During the week the Crescent shipped 160,000 pounds of first-class ore. The Mackintosh sampler received no ore this week because bad roads prevented hauling. Last Saturday the Ontario shipped 33 bars of bullion, containing 18,682.40 fine ounces of silver. On Wednesday 10 bars of Daly bullion, containing 12,892 fine ounces of silver, were shipped from the Marsac mill, and to-day the product will be six bars,

L. C. MARSHUTZ

T. G. CANTRELL.

# NATIONAL IRON WORKS

N. W. Corner Main and Howard Sts., San Francisco,

—MANUFACTURERS OF—

Stationary and Compound Engines, Flour, Sugar, Saw  
and Quartz Mill Machinery.

AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description  
ALL WORK TESTED AND GUARANTEED.

IMPROVED PORTABLE HOISTING ENGINES.

## NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ &amp; CANTRELL, Sole Manufacturers.

Send for Circulars and Price List.

MARSHUTZ &amp; CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

## THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

## AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

## Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

TATUM &amp; BOWEN,

34 and 36 FREMONT STREET,

SAN FRANCISCO, CAL.

Manufacturers of Mining and Sawmill Machinery, Engines, Boilers, Etc.

A. T. DEWEY. } Dewey & Co.'s Scientific Press Patent Agency { ESTABLISHED  
W. B. EWER. } 1860  
GEO. H. STRONG.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

# FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

**43 DEY ST., NEW YORK.**

FOR SALE.

2 Triumph Concentrators.  
1 New 12-inch, 35 H. P. Engine.  
VERY CHEAP. Apply

130 Sansome St., room 12.

BACK FILE of the MINING AND SCIENTIFIC PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

## The Late General Master Mechanic of the S. P. R. R.

(Continued from page 137.)

engine slide-valve. The improved anti-compression valves were simply long pieces of iron or other metal combined with their valve-seats and stems; relief-valves combined with their respective cages and steam-passages; and a wedge-shaped metal ring placed in the cavity around the top of the rim.

In 1869 Mr. Stevens turned his attention for a time to steam plowing, and on August 10th secured Patent No. 93,494 for a steam-cultivator. The patent was for a revolving plow-cylinder having the plows secured therein and adjustable on the pedestals, and the system of gearing transmitting motion between the engines, the plow-cylinder and the driving wheels in combination therewith.

The first piston packing invented by Mr. Stevens was patented March 7, 1865, No. 46,723. This invention consists in the use of a T-shaped and two L-shaped rings in combination with the head and follower of a steam piston in such a manner that the three rings are held in position by each other and by the piston-head and follower; and the L-shaped rings project up over the outer edges of the head and follower, and flush with the outer surfaces of the same, for the purpose of securing an increased surface between the packing rings and the cylinder.

A slide-valve was also invented by him and patented July 7, 1863, No. 39,181. The improvement was to prevent the pressure of steam in the cylinder on the exhaust side of the piston, after the port has been closed by the cap of the valve on the inside, and consists of the sub-titulation for a single anti-compression valve of the sliding kind, of two poppet valves operated upon directly by the steam. It also consists in protecting the back of the main valve from the pressure of the steam, and providing communication between the anti compression valve chest and the atmosphere by means of a follower and gland above the said chest.

As far as we have been able to learn, the first patent obtained for any of his inventions by Mr. Stevens was June 18, 1861, when patent No. 32,589 was issued to him for a slide-valve for steam engines. In this patent the "anti-compression" valve is inclosed by the chest which is bolted back of the main valve and consists of a flat plate having two ports of a width equal to that of the upper ports of the passages, but so much nearer to each other than the latter ports that when one of the two is opened by the corresponding port of the valve the other is closed by the valve. Secured to the top of the valve-chest is a counter pressure plate, which is attached to the said valve-chest and consequently to the main valve by a tube which screws into the chest and serves as a means of communication between the valve-chest and the atmosphere or exhaust pipe. By means of a bell-crank lever the anti-compression valve derives such a movement as to open and close the upper ports of the passages alternately at the proper time to permit the exhaust to be continued through these passages and through the chest and tube after either cylinder-port has been closed to the main exhaust-port by the main valve.

Of course, in the space at disposal, it would be impossible to give more than a mere idea of the nature of these mechanical inventions of Mr. Stevens. A summarized list will be interesting to his friends, in addition to such details as we have presented. The list of patents granted by the Government to Mr. Stevens is as follows:

Name of Patent.	No. of Pat.	Date.
Balance Slide Valve.....	357,424	Feb. 8, 1887
Apparatus for Mining Petroleum.....	348,790	Se. 1, 1886
Feedwater Purifier.....	331,917	Dec. 7, 1885
Feedwater Purifier.....	329,603	N. v. 3, 1885
Valve Gear for Steam Engines.....	324,964	Aug. 25, 1885
Hoisting Crane.....	305,248	Sept. 16, 1884
Valve Gear.....	288,133	Nov. 6, 1883
Steam Steering Apparatus (re-issue).....	9,990	Dec. 27, 1881
Feedwater Heater.....	240,137	Apr. 12, 1881
Friction Brake for Steering App't's.....	239,877	Apr. 5, 1881
Steam Steering Apparatus.....	231,905	Aug. 24, 1880
Steam Steering Apparatus.....	230,079	July 13, 1880
Steam-moved Valve.....	181,370	Aug. 22, 1876
Flue and Tubular Boiler.....	180,956	Aug. 8, 1876
Balance Slide Valve.....	154,529	Aug. 25, 1874
Vacuum Relief-valve for Cylinder.....	146,617	Jan. 20, 1874
Locomotive Furnace.....	145,813	Dec. 23, 1873
Locomotive Furnace.....	111,884	Feb. 14, 1871
Slide Valve.....	100,814	Feb. 16, 1870
Steam Cultivator.....	93,494	Aug. 10, 1869
Piston Packing.....	46,723	Mar. 6, 1865
Slide Valve.....	39,181	July 7, 1863
Slide Valve.....	32,589	June 18, 1861

Aside from these patented inventions, Mr. Stevens introduced many improvements and made many experiments for the more practical working of the mechanical departments over which he presided. He was, as may be imagined, a very practical man. He built the first locomotive and the first coal-burning locomotive in this State. All the machinery of the largest ferryboat in the world—the Solano—was selected and placed by him. He also designed and built the machinery in the ferry-steamer Piedmont, the inclined engine being low down so as to leave a clear

upper cabin. He designed and constructed a number of pumps, large and small, but patented none of his designs. The machinery for the new boats Apache and Modoc was built by him. The locomotives and engines designed by him are unique and economical, being admirably adapted for their special work. Among these are the engines on the Oakland local road and the El Gobernador, one of the largest locomotives in the world, designed for the Tehachapi Mountain division. It was through Mr. Stevens that the rolling-mill plant was built at Sacramento and the immense shops there much enlarged, and all the engines there were designed by him. The hydraulic system of cranes and elevators in the foundry and machine-shops at Sacramento are of his construction. He also designed the largest steam-hammer at the railroad shops; the spike-machines used there; the safety revolving switch stand used by the Southern Pacific Company; the machinery for handling the heavy aprons at the ferry-slips for the Solano's landing on Carquinez straits. Mr. Stevens was doubtless the leading designer and inventor of mechanical appliances on the Pacific Coast.

Mr. Stevens' son Fred naturally took to the pursuits which his father had followed. For a number of years he "fired" on a locomotive on the road of the Central Pacific, and was in time promoted to be an engineer, a position he held for some years. He is now acting as Division Master Mechanic with headquarters at Dunsmuir, in the Shasta region. He is a bright, intelligent young man, now receiving practical knowledge of rail-roading in all its branches.

### A TRIBUTE.

THE ILLUSTRATED PACIFIC STATES will issue in a few days a 20-page number containing a portrait of the late A. J. Stevens, General Master Mechanic of the S. P. R. R., together with illustrations of some of his inventions and of the floral offerings made by his associates for his funeral. With this will be a sketch of his life and a detailed account of his many inventions. Some 15,000 copies of this edition will be printed. A great deal of care has been taken in the preparation of this matter, which cannot fail to interest the late Mr. Stevens' many friends. The number is such a specimen of California illustrated newspapers that those who are not familiar with the paper would do well to inclose 10 cents for a sample copy to the Illustrated Publishing Co., 220 Market St., San Francisco.

### Mining Share Market.

The mining share market still continues active. As the Virginia Enterprise says, "Neither ore developments nor hullion shipments seem to have power to lift stocks out of the rut into which they have fallen. It appears to be impossible to get up even a boomlet, and such a thing as an all-time boom is not thought of. The active and courageous dealers of former years seem now to be quite out of the ring. In their stead we have a set of half-and-half, milk-and-water operators, to whom a two-bit rise seems a 'good killing,' and a rise of four bits means affluence. The Stock Board now fiddles to small dancers—a lot of little wooden men pulled by strings."

"The leading mines are all looking well and yielding largely and regularly. Ore is in sight in more different mines at the present time than ever before in the history of the Comstock. Quite a number of mines now have ore that have not yet succeeded in obtaining milling facilities, but the opportunities for getting ore worked will presently be better. The outside mills are now starting up; the Alta mill will soon resume operations, and it will not be long before the whole 40 stamps of the Chollar water-mill will be in operation. They yesterday began the work of laying a second line of water pipes from this tank on the side of Mount Davidson to the mill. When this pipe is in place two nozzles will be brought to bear on the Pelton wheel which has thus far driven half the machinery of the mill. It is expected that this one wheel will readily drive the whole of the machinery of the mill."

### Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Savage, Feb. 27, \$9500; Standard, 27, \$12,891; Grand Prize, 27, \$29,000; North Belle Isle, 27, \$18,000; Con. California and Virginia, 25, \$101,969; Pollock, 28, \$7872; Silver Bow, 28, \$13,344; Bluebird, 28, \$38,016; Lexington, 28, \$24,000; Germania, 21, \$1630; Hanauer, 21, \$4375; Queen of the Hills, 21, \$21250; Hanauer, 26, \$2250; Germania, 22, \$1596; Hanauer, 25, \$4440; Crescent, 26, \$3350; Hanauer, 26, \$2300; Germania, 26, \$1580; Queen of the Hills, 26, \$1263.

LARGE repair shops are to be built at Los Angeles by the S. P. R. R. Co.

### New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

**COSTA RICA EXPLORATION Co.**, Feb. 27. Object, to acquire mineral lands in Central America. Directors—E. C. de Sahla, Jr., E. A. Denicke, C. K. Bonestell, J. Frownsfelt and E. O. Gaestner.

**AMERICAN PATENT DRILL AND REAMER Co.**, Feb. 27. Object, to sell patents for sinking artesian wells. Directors—I. H. Rus, C. M. Oakley, C. O. Lang, J. G. Huss and W. C. Chapman.

**DEL MAR & SAN DIEGO R. R. Co.**, Feb. 27. Object, to construct a railroad from the town of Del Mar to San Diego by way of La Jolla, Pacific Beach and Ocean Beach. Directors—Geo. K. Porter, F. C. Siehe, Alexander Innis, W. H. Carlson and F. J. Higgins.

**LACHMAN CALIFORNIA WINE Co.**, Feb. 23. Capital stock, \$1,250,000. Directors—Samuel Lachman, Albert Lachman, Henry Lachman, Leo Metzger, and Hamilton W. Crahn.

**MARINER'S SAFETY COMPASS Co.**, Feb. 29. Capital stock, \$1,000,000. Directors—Lewis R. Mead, George W. Arnold, Daniel Titns, Neil C. Whitys and Joseph A. Sladky.

**PACIFIC ENDOWMENT AND IMPROVEMENT ASSOCIATION**, Feb. 29. Capital stock, \$2,000,000. Object, securing in California, Mexico and Central American States patents for the endowment and management of schools, academies, art galleries and hospitals; also to engage in commercial pursuits and mining. Directors—A. M. and J. H. Loryea, E. Wolfe, E. Sloman

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co. a Patent Office Library, 20 Market St., S. F.

FOR WEEK ENDING FEBRUARY 21, 1888.

378,270.—CARD EXHIBITOR—Valentine & Bailey, S. F.  
378,155.—LEVER-POWER ENGINE—E. T. Wheel, Oakdale, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

**CARD EXHIBITOR.**—Walter D. Valentine, S. F. No. 378,345. Dated Feb. 21, 1888. This invention relates to that class of machines for exhibiting cards in which the cards are contained in a hollow column or tube, and are successively forced out by a slide into a holder, said holder having a movement by which it is placed in position to receive the card, and, after exposing, to discharge it. The invention consists in the novel pushing-slide and attached card-support, and the mechanism for operating the slide, the movable card-holder and the mechanism for operating it, an alarm apparatus, and a governing device for controlling the operation of the machine.

**POWER MECHANISM.**—George Cottrell, S. F. No. 378,192. Dated Feb. 21, 1888. This invention relates to that class of power mechanism employing differential gears, and in which an eccentric operates upon a swaying toothed disk which engages with a gear having a different number of teeth, whereby the power transmitted to said gear is a differential one. The general object of this invention is to provide a differential power mechanism which is applicable to all machines which require the rotation of an inner part by means of power applied primarily to an outer part, such, for example, as capstans and presses. The particular object is to provide a suitable power mechanism for a wine or cider press, which is adapted to vary its power to conform to the demands of the work.

**PROPELLER WHEEL.**—Walter L. Strong, S. F. No. 378,221. Dated Feb. 21, 1888. This improvement to screw propellers consists of spirally formed blades or vanes extending radially outward from the hub, which is to be attached to the propeller shaft, and in combination therewith of an exterior hood or ring cast with or secured to the edges of the propeller blades and inclosing the front edges of the propeller blades, while the rear ends are allowed to project beyond and behind this ring. The hub, forming a part of the propeller and rotating with it, holds the water and prevents it from being thrown outward by the rapid revolution of the propeller, and thus gives it a strong hold on the water, keeping the latter also a solid body and preventing its being churned up, and also serving to give it an impulse directly back and in the line of travel of the boat. By leaving the rear portion of the propeller blades uncovered it allows the water to escape freely and discharge from the propeller without choking.

**CARD EXHIBITOR.**—Walter D. Valentine, S. F., and H. S. Bailey, Denver (said Bailey assignor to said Valentine). No. 378,270. Dated Feb. 21, 1888. The invention relates to that class of machines for exhibiting advertising and other cards. It consists in a vertical tube or hollow column for receiving and confining the cards, the tube or column having exit-apertures on the base of its sides, a reciprocating follower moving under the tube or column and having a cross-piece adapted to come in contact with the edge of the lowermost card on each stroke, whereby it forces one card out one side and the next card out the other side, vibrating card-holders operating on each side of the tube or column, and adapted to receive a card when in a horizontal position, and to move to a vertical position to exhibit it, and a periodically moving mechanism by which the several parts are operated. The object is to provide an effective card exhibitor which will operate automatically and at such stated or regular intervals as will permit inspection of the exposed cards before they are turned down to make place for others. This invention is a very ingenious one.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. A NEW AMERICAN BOOK  
Minerals, Mines and Mining.  
JUST READY.

A Practical Manual of Minerals, Mines and Mining. Comprising suggestions as to the localities and associations of all the useful Minerals, full description of the most effective methods for both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, I. L. D., author of "The Metallurgy of Iron and Steel" Illustrated by 171 engravings. In one volume, 8vo., 367 pages. Price \$4.50, by mail, free of postage, to any address in the world.

**CONTENTS.**—PART I. MINING MINERALOGY, AND ECONOMIC TREATMENT AND HISTORY OF THE USEFUL MINERALS. Mining Mineralogy, Preliminary Principles and Preparations, Economic Treatment and History of the Useful Minerals, Gold, Silver, Copper, Nickel, Iron, Tin, Zinc, Lead, Manganese, Platinum, Iridium, Mercury, Antimony, Bismuth, Chromium, Cobalt, Corundum and Emery, Pumice Stone, Infusorial Earth, Griststones, Bihrtones, the Diamond.  
PART II. MINING WORK AND ARCHITECTURE, INCLUDING VARIOUS SUGGESTIONS, WITH DESCRIPTION OF ASSOCIATED APPARATUS AND MACHINERY. Mining Construction and Machinery. [This part comprises 99 pages, illustrated by 165 engravings, with details too full to be comprised within the limits of this advertisement.]  
Appendix. Sinking Artesian Wells, Oil and Gas Wells, Index.

An illustrated circular, 4 pages, 4to, giving the full Table of Contents of this volume, will be sent free of postage to any one in any part of the world who will apply by letter.

The above or any of our Books sent by mail free of postage, at the publication price, to any address in the world.

Our New Revised Descriptive Catalogue of Practical and Scientific Books, 80 pages, 8vo., and our other Catalogues and Circulars, the whole covering all of the branches of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

A. T. DEWEY, } Dewey & Co.'s Scientific Press Patent Agency { ESTABLISHED  
W. B. EWER, }  
GEO. H. STROGO, }

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S. F.

ORE CRUSHER

Sectional View of Pulverizer.

## PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

**POWERFUL OPPOSING CURRENTS**

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

**10 TO 200 TONS PER DAY,**

Including a Sectional Steam Boiler supplying all the power required.

## Soderling's Amalgamating Pan.

In the ordinary construction of amalgamating pans, it is customary to grind the material in the pan by means of mullers rotating above fixed dies, and between which and the mullers the material is caused to pass, so that the two opposing surfaces will grind and reduce it, in the presence of mercury and chemicals, which assist in saving the precious metals. Mr. August Soderling of Bodie, Mono county, has patented a pan in which it is possible to cause the material itself to act as a grinder upon other parts of the material; and the pan has been constructed by Mr. Isberg with special reference to the production of counter-currents.

Fig. 1 of the engraving shows a pan having a steam bottom and a muller with grinding shoes. Projecting wings are placed on the inner muller, as shown. The muller has a cone extending upward above the central cone of the pan, and is driven by a hollow shaft which extends up through the central cone and has a feather or key by which it is connected with the muller, so that the two will move together. This hollow shaft is driven by a beveled gear-wheel, which is engaged by a pinion on the horizontal power shaft.

Another shaft extends up through the hollow shaft, and has a gear wheel at its lower end engaging with a pinion on the power shaft, this one horizontal shaft serving to drive the two vertical shafts in opposite directions by means of the gears as shown. The upper end of the inner solid shaft has a feather which engages a corresponding keyway in the upper end of the cone of the outside ring shown in Fig. 2. This cone extends down outside of the inner one which connects with the muller, corresponding with it in shape, and it is connected with the isolated ring shown in section in Fig. 1, and in perspective in Fig. 2, this ring being driven by it in an opposite direction from that of the muller.

The slots in this ring are preferably made angular as shown, and the sides of the slots are curved so that when rotating the tendency will be to carry the material from the outside of the pan through the slots and throw it toward the center by the centripetal force, when it will come in contact with the oppositely moving current which is thrown outward centrifugally by the inner muller, and its wings moving in the opposite direction.

This action produces two lateral currents coming in contact with each other, and causes the harder and softer portions composing the pulp to erode or disintegrate each other, thus releasing any precious metals which may be still contained therein. The mercury which has become floured by grinding and the whole mass of material will be acted on by the chemicals employed during the process.

The pan with the steam-bottom muller and driving gear is similar to those used in the ordinary grinding pans, but the isolated ring rotating in the opposite direction from the muller and without contact with it or any other portion of the pan produces an action which Mr. Soderling is confident is much more efficacious than can be accomplished by any amount of grinding. The time is no greater than that occupied in the ordinary grinding, and the extra power is only that necessary to run the isolated ring, which may be given more or less speed by altering the relative sizes of the gear wheels. The blades in the rings may be cast at any angle de-

Fig. 2.—SLOTTED RING OR SUPPLEMENTAL MULLER.

Fig. 1.—SECTIONAL VIEW OF SODERLING'S AMALGAMATING PAN.

sired according to the work to be accomplished. In some rings the blades are cast at quite an angle to cut the current; in other cases they are set straight to drag in the current.

Mr. Soderling informs us that his experi-

ments show that with an ordinary muller pan, slimes without the addition of sand will yield only about 15 per cent of the precious metals contained in them, but by the addition of the slotted ring to the pan the yield increases to about 70 per cent. By the use of this device friction is avoided which would be necessary if more grinding surfaces were employed. The effective action is claimed to be greater inasmuch as the striking points of the opposing currents are acting all the way round the pan, and so far from the center as to be in operation about one-third of the radius of the pan from the edge. Slimes, sands, ores and tailings of low grade can be worked with this appliance.

Fig. 3 on page 153 shows how the new muller or ring can be added to any ordinary pan, and be rotated from the top. The ring or supplemental muller is also shown in this cut. This forms simply a modification of the ordinary pan.

In amalgamating pans hitherto constructed to form currents, Mr. Soderling says the mullers had to revolve at too great speed for desired effect. When larger pans were desired for economy, the ratio of effectiveness of impact action was very difficult to obtain in the same proportion, as the cubic contents of the pan had to be increased. In this new device these difficulties are obviated. The isolated slotted ring or muller gives impact and opposing currents all around the pan and does as good work in a large as in a small pan, the ratio of contact increasing as the cubic contents increase. This fact is very important, as amalgamation can be effected more quickly and an increased yield of the precious metals results. Mr. Soderling says he has already proven this by experiments made on low-grade tailings that previously could not be worked with profit, but are now, in Bodie, paying well when worked in this pan. After practical work there, Mr. Soderling states that this new pan can be run at one-fourth the cost of the old pan. In 2½ hours' run he is enabled to obtain between 60 and 70 per cent of contents, while in running the old-style pan five hours he can only obtain 30 to 40 per cent. Tailings can be worked in large quantities in this pan. Correspondence is solicited with parties having large tailings deposits anywhere on this coast. The owners of this patent are A. Soderling, Bodie, M. Isberg, 214½ Clara street, San Francisco, and C. E. Bagge, Oakland.

A MINING engineer of this city was recently in the mountains on a business trip, and while talking with some miners in a cabin one evening the conversation turned on a well-known mining man who died a few years since. "Old Gash," as he was called by his familiars, has had many a story told on him. After several reminiscences one of the miners said: "Well, poor old fellow, I guess he's milling free gold in heaven now." "I dunno," said another, "perhaps he's taken to smelting!"

DID KNOW IT WAS LOADED.—The last miner to put in a "shot" and knew it was loaded, but went back to see why the blast did not go off, was Louis Gilmore of the Sam Slick mine, Chewawis district, Washington Territory. His companion, Frank Henshaw, who went back too, was so badly hurt that he could not attend Gilmore's funeral.

QUICKSILVER has fallen a little in prices, being now quoted at \$38.50 to \$40 per flask. Receipts of quicksilver thus far this year amount to 3913 flasks, against 4515 during the same period in 1887; while the exports have been 1837 flasks, against 3174 in the same time last year.

## CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—JDS.

## A Trip to the Los Burros Mines.

[From Our Own Correspondent.]

There are hundreds and thousands coming to this beautiful State who rush through it in the railroad car or stay at the well-known pleasure resorts beautified by art only, and never see California as it is. These people then go home, and when they did not find the same comfort they are used to in their residences on Beacon street or on the Hudson, they grumble at the exaggerations of the beauties of this country. How seldom do we find here a traveler who can boast of mountain climbing simply to see the grand mountain scenery. The Englishman traveling in Switzerland is never without his guide-book, and examines nature carefully in reference to the correctness of his guide-book; and the American runs through the country and tries to see the most in the least possible time, so that it is said of one who had written to his father that he calculated to have been in Cologne, as he had seen a very large church the name of which he could not ascertain for want of time. Just so it seems to me sometimes when I hear people speak of California: "It took us only so many hours to see Yosemite, but that dreadful stage-riding, it broke me all up; they ought to build a railroad through it." Yes, and spoil nature! But I go astray somewhat. I was going to describe a little trip through a country wild and virgin, almost untouched by cultivation. I mean a trip through the Coast Range to the newly discovered gold mines in Monterey county. But first let me tell you that I am not a fond of hard work as I seem to be, as I was sent to make the trip and report of the mines. I will leave out my experience of railroad-riding, but invite you to mount the cart with me and off we go.

The way through the Salinas valley is charming, but known so well that I need say little about it. Kings City is one of the newly erected towns with its hotels, stores, etc., and a very obliging postmaster, and is so far contented to exist. As a matter of course there is no bridge over the river, and I could hardly get my horse through the quicksand. My horse is a tame mustang and would, I suppose, like it much better to sit herself in the cart than to drag me through the country. I do not blame her for it, and I hope only that in case the old Egyptians are right and our souls have to wander through the hodies of several animals, I am not bound to go in a newspaper agent's horse. It's a pretty hard life. After crossing the stream we travel through green fields and pastures until we pass the Spanish Grant and find the road lined with charming farm-houses, mostly of the Spanish style, surrounded by nice orchards and splendid oaks. Soon we enter the valley proper, the side hills of which are all heavily covered with oaks and chaparral. One farm-house more in a little cozy patch and we begin the gradual ascent of the foothill range, as you may call it, winding around the grade in an easy manner. As soon as we come to the summit we have a most charming view over the Salinas valley with its green fields and white farmhouses and far over to the range of the easy-rolling White Chalk mountains which form the line between Monterey and San Benito. The grade is some 1500 feet high and the air is already much lighter and more genial than in the warm valley. After passing the summit we go down to the Jolon Flat, a thickly settled fertile valley. The heat is less, of course, taken in by the large Spanish grants, but fortunately the *dolce-fur niente* liking Spaniard cannot any longer oppose the approach of the hard-working American, and the ranches are being sold now and divided up for settlement. The hills are covered partly with pine trees, partly with sagebrush, and in the valley thrive the oak. Soon Jolon is in sight and we take a last glance at the mountain beautified by the setting sun. Jolon is an old town, but did not grow too much; how it will do now no one can tell, especially if the mines should prove to be as valuable as they seem to be. I took lodging in one of the hotels, and next morning, after a good rest in the salubrious air, I provided myself with food for horse and man and set to traveling again. It was pretty warm, and, as a matter of course, I took the wrong way. I should not have done so, as they had expressly advised me to take the right way, and that was to be the most traveled one; but unfortunately my opinion differed in this respect and I took the way to the old Mission San Antonio.

San Antonio was founded in 1771 and was once a thriving place. It still has in its midst the ancient Mission church with its massive adobe walls, its roof of red-fluted Mexican tiles and its lofty campanile and enormous bells which now call the pious only every four weeks to service. There is a jail and different other buildings half in ruins, a substantial monument of the labors of the Franciscan friars. Extensive irrigation works speak further for the industry of the old padres.

I followed the road along a dashing creek through wild mountains, and after a ride of four miles was lucky enough to learn from a century-old Spanish senora (at least she looked that old) that the way to the mines lay some seven miles back. When I turned my horse it seemed cheerful, expecting to go home again.

The poor fellow was cheated this time. It was very comfortably warm in these mountains, and they said still it was a nice cool day with only 91° in the shade. After awhile I found the right road and passed the Antonio river. This stream, as well as the Nacimiento, empties into the Salinas river, running parallel to the latter in an opposite direction. The whole country is divided up in large Spanish grants, and they include some of the richest land and the loveliest valleys in this district. The latter are thinly covered with immense oak trees some four and five feet in diameter and covered with dark-green grass as beautiful as a garden lawn and watered here and there from small springs. The mountains or hills are smoothly rolling and also partly covered with these majestic trees. After some eight miles traveling through this charming country I landed safely at the foot of the wild mountain range and got ready for the ascent. My horse looked at the mountains and then watched me; it seemed to expect nothing good when I put the saddle on it and let it have some food. Some one had told me the trail was excellent and it would not take me over two hours to come to the mines. I found it a little different, as will be seen later. It was four o'clock when I mounted my horse and started up the mountain. The scenery began to be very romantic. Immense rocks had rolled down from the steep mountain-side and formed a wild chaos out of which, between the shrubbery, pines had forced their way to light and sunshine. Here the trail is sometimes very steep and engaged all my attention. It was very careful in going down the steep trail, and I, not being used to it very much either, had to leave the saddle several times. After an hour and a half we had reached a point where the trail turns around the mountain and I stopped to look at the beautiful panorama below me. There was the roaring Nacimiento river, which forced its way through a narrow valley or gulch opposed in every direction by those gigantic rocks. There lay stretched out the charming valleys with green carpets, and to the right and left the heavily timbered, smoothly rolling hills and picturesque mountains in the evening shadows, partly colored to a charming pink from the setting sun. I was sorry indeed to leave the picture, but the setting sun and the sense of hunger made me consider the advisability of getting to night quarters soon. My horse seemed to be very tired, and therefore I left the saddle and began to climb the trail on foot, dragging the horse behind me. It was hard work. Not only was the trail very steep, but the horse did not like to go fast at all, and neither good nor bad words had any effect. By this time the last vestige of daylight had vanished and the picture before my eyes was visible by star and moonlight alone, and what a moonlight it was! Not a shred of cloud hung in the sky, which was of the pure blue that one sometimes sees in the Alps. On all sides rose the dim mountains with forest dark and quaint, while from the gorges along their slopes and from the valley below came the low music of streams rushing downward. On I went, up and down, without visible end. It was already 8 o'clock, and I began to feel very hne about not reaching an inhabited place. The horse took revenge on me. I tried different ways to bring it to a faster step—for instance, by holding on to its tail, but this had the only effect to bring it to a complete standstill; yes, it even "laughed" at me when I had trouble to fasten the barley sack to the saddle. Sometimes I rested to listen to the concert of the frogs and locusts and the cries of the owls and coyotes, when these went through the quietness of the night. About 10 o'clock I was completely exhausted and sat down to consider my condition. I was sure I must have passed the mines and got on a wrong trail. The trail was there, but no end to it. Then suddenly I saw a light across the mountain from the direction I had come, and immediately began to hallo as loud as I could. A multiplied echo was the only answer. I got ready to go back, and had just started when I discovered that the light seemed to be raised, and watching it closely I found that a very bright star had played with my imagination. I went on, as the trail ought to have an end, but had difficulty in finding the way always, because thick shrubbery and large trees prevented the moonlight penetrating to it. About 11 o'clock I made another halt, and heard, to my pleasure, a well known sound, the roar of the ocean. I took new courage, let the horse eat, and stilled my hunger with some of the barley, and after a little while started anew. I had not made a quarter of a mile when I suddenly heard a welcome sound passing through the air. It was the regular tact of a stamp-mill, and not long after I landed safely in the camp. I had some difficulty in reaching the people, but after awhile the inn-keeper helped me to a night's lodging on the floor of a cabin, where I fell asleep right away and slept soundly until daylight.

Before continuing to relate my journey, I may as well say a few words about the mines. It was until lately thought impossible that gold could be found in the Coast Range in paying quantities, and the onion held good till April, 1887, when Mr. D. W. Cruickshank discovered a vein of very rich ore in the gulch where he was prospecting for placer gold. Since that time a great many other veins of gold and silver have been discovered, some paying as high as \$1100 a ton. The mines are situated on the west slope of the Coast Range at an elevation of 3500 feet above the sea level, four miles

east of the coast and 18 miles northwest of Jolon. The prospects are very encouraging, and I think it will be a very lively camp. From what I heard and saw during my visit, it appeared to me that the Los Burros mining district should become one of the noted camps of California. The Los Burros mines are situated 18 miles from Jolon and four miles from the ocean, on the western slope of the Coast Range, with comparatively easy access from both directions. They were discovered by Mr. W. D. Cruickshank, by tracing from the gulch where he had found free gold in the creek. The first vein he struck was a four-inch one and proved to be very rich, as 18 pounds of the ore yielded \$25. On the first vein discovered he sunk 22 feet. In this shaft are two veins, one being 8 inches, the other 16. Two other equally rich veins were found respectively 60 and 85 feet further north of the above mentioned. A tunnel on the upper vein is 100 feet long; the vein is traced 400 feet, some of the ore assaying \$250 per ton. The average width of the vein is 16 inches. At present Mr. Cruickshank has a three-stamp mill running day and night; this they propose to enlarge. They propose to run a tunnel some 350 feet to tap the vein at a depth of about 100 feet. No low-grade ore has been discovered in any of the veins. The mining district—that is, as far as prospected—is from 10 to 12 miles in extent, but it seems to include the whole western slope. Old miners have found placer gold in all directions in paying quantities, contrary to the opinion of the scientist, who considered the existence of the precious metals in this mountain range an impossibility—a triumph of practical experience over theory.

Among the various mines that are opened and prospect as good as the one described is the Manchester mine, named after old Captain Manchester, who is most positive that there are millions in it. He pounded out of one pound of ore \$1½ worth of gold. This mine is situated one-fourth mile below the Cruickshank and work will be commenced on it immediately. The Ajax mine is ½ miles southeast from the Cruickshank. It has a very rich ledge of antimonial silver, with gold. The principal vein averages two feet in width. There is a tunnel some 150 feet long, in which was struck immensely rich ore. Operations will be begun there soon. The Grand Pacific has a shaft 50 feet in depth. A contract has been let for running a tunnel of 300 feet. Some specimens of the ore yielded as high as \$1130 per ton.

A contract has been let on the Esmeralda, adjoining the Cruickshank, for 100 feet of tunnel, and one on the northeast extension of the Cruickshank for the same length.

There is a quantity of fine fir and redwood and an inexhaustible supply of water. There is a scarcity of good miners, and experienced men will find ready employment.

As to beauty of landscape, the place is certainly unexcelled. From the stamp-mill you look over a heavy-timbered gulch down to the broad ocean, which daily sends up a gentle breeze to temper the heat of the day, but keeps the fog in the valley below. After I had received all the information wanted, I put the saddle again on my horse and started on my way back. Never will I forget the unsurpassed scenery. After a half hour's ride I left the timber behind me and had before me a panorama bursting into view never seen before. You look down into a great pool of mountains, valleys and gulches, with running streams and verdant meadows, while the steep mountain-sides are covered with heavy redwood, the light Monterey pines and dark fir, and as a grand background you see the immense ocean, the roar of which you can plainly hear. Right before you is the Santa Lucia range, with the Santa Lucia some 6000 feet high and different other peaks, and all around the endless mountain ranges and peaks down to San Luis Obispo and over to San Benito. Above you the blue sky, contrasting wonderfully with the dark forests and reddish mountains. In the far distance you will observe a chain of white chalk mountains, reminding one much of the irregularities of the Alps. Over the ocean there is partly a light cover of white fog, but not so thick as to prevent one seeing the passing steamers and sailing craft. I was so delighted with my sojourn there that I could make up my mind with difficulty to leave that grand view of mountain scenery, which at this season of the year is most beautiful in its adornment of living green. But duty goes before pleasure and I had to leave. I am sorry to say that vandalism has already penetrated in this beautiful region and that foolish hands have set the shrubbery on fire and splendid forests are destroyed. When will America awake and protect its beauties and resources of wealth? After a few hours' ride I came to the descending point. Not long after I was again from where I started in the valley of the Nacimiento. Without further incident I landed safely in Jolon, where I enjoyed the good beds of the Tidball hotel immensely.

J. G. H. LAMPADUS.

W. R. ECKERT, the mechanical engineer, has gone to Virginia City for the purpose of changing the present system of wire-rope power transmission from the Pelton wheels to the C. and C. shaft, which operates the California battery mill. The object to be attained is to equalize the strain on the four lines of steel wire-rope to prevent them from stranding and breaking, as they frequently did under the old system. Mr. Eckert is confident he can overcome that defect, and expects to have the California mill-stamps in operation in April.

## Notes on Salvador.

[Written for the Press.]

One of the ways—in some cases the best way—of reaching Honduras is through the snug little Republic of Salvador, landing at the port of La Libertad at which the Panama steamers touch. The steamship company only contracts to carry passengers "to the anchorage" at any port, consequently the passenger must be prepared to pay the expense of landing himself and his baggage. How it would fare with the unfortunate who might lack the wherewithal to do this is a problem; I presume he would be marooned.

The port named is nothing more than an open roadstead, and at times it is not feasible to cast anchor there nor possible to land any person or thing. The inconvenience of landing in the surf is obviated by means of a long wharf supported by iron piles, and passengers and their baggage are carried thereto by the same lighters which take the freight from the ship, small boats being used only by the company's agent and the officials of the country. When there are lady passengers, a gangway chair is used in the transfer from ship to lighter, otherwise the polite and obliging company furnishes no better means of leaving the vessel than to crawl through the cargo port on the lower deck and drop or tumble into the rising and falling lighter alongside, with imminent risk, by means of a mistimed drop, of fracturing or dislocating your limbs and the almost certainty of smashing any article of baggage upon which you may happen to alight; and this after charging \$100 for the passage, while carrying others all the way to New York for \$80 each!

Arriving at the wharf, one is hoisted up in a chair by means of the crane and steam engine used for less precious cargo; nor does the similarity between a person and any other package of goods end here, for the wharf company charges half a dollar a head for wharfage in addition to two reals for each *bullo* or package of baggage, and double as much for the lighter, so that landing is a costly business. It will be observed that the charges for baggage are per package, and as the weight of the package is scarcely considered, a saving may be made by uniting several valises, saddles, etc., in one *bullo* by means of sacks or cordage. This resource is not, however, available in the case of persons.

The next thing is the custom-house, to which the baggage is transferred on tram-cars. The examination of baggage is not strict, nor is the person searched, as a rule; and this laxity is taken advantage of by people who are posted, and who are willing to earn an honest (?) penny by the abuse of courtesy. The town of La Libertad contains two hotels, of which the one is bad, the other worse; for the rest it is little more than a village with a custom house, *cuartel*, etc., added. The cable-telegraph station here is conducted by an English gentleman named Clark, assisted by his wife; they are very polite and obliging to strangers. The postmaster is also obliging, in a slightly different way; that he is polite goes without saying, he being a native of the country. To an inquiry for letters for strangers, the usual reply is the enrollment of all such in the office to examination by the applicant, who is thus at liberty to take his choice, which is a simple and effective way in which to overcome difficulties of spelling and pronunciation.

Between the port and San Salvador, the capital, a distance of about 30 miles by the road, there is a stage-line; the trip is made in from four to eight hours, according to direction, up or down and season, wet or dry, including a half-hour for lunch at Zaragosa—fare, \$4. San Salvador is a nice little city, as cities go in these countries, which I cannot take space to describe minutely. The streets are narrow and irregular, but clean, having good drainage into a river. There are three plazas, two of which are inclosed gardens with well-paved walks, music-stands and seats; the third, or *plaza de armas*, is the largest. It was formerly occupied, when not required for other purposes, by a horde of small dealers in fruit, food, clothing, trinkets and other trash, which have lately been mostly transferred to a fine new market-building, roofed with corrugated iron, and well paved, drained and stabled.

The dealers or *comerciantes* mentioned are mostly poor folk living in the enshrined and surrounding country, chiefly women who may be met by hundreds in the morning coming to town with their stocks on their heads; there are, however, plenty of good stores in the town. Salvador is an independent republic with a population of less than a million; the people cannot be distinguished by a stranger from those of the neighboring nations. The country seems quite prosperous, its debt being small and its bonds quoted high in the nineties. The president, Menendez, is the people's man, and seems to be an honest officer who is doing his best to put a stop to "boodling" in the Government, for which he is cordially hated by those who have heretofore fattened on plunder, a number of whom have recently been detected in a treasonable conspiracy and inconspicuously expelled.

Our arrival occurred during the great municipal fiesta of the city's patron saint, which lasts 10 days, during which a good deal of powder is exploded in the shape of fireworks and salutes by cannon and mortars; also there are grand processions with ornate structures on

wheels, drawn by oxen or by men, and carrying allegorical and historical figures, both alive and otherwise, of liberty, Columbus, saints, martyrs, etc., each day being devoted to a special subject, and the last grand triumphal car being surmounted by an image of Saint Savior himself.

A peculiar feature of the firework part of the festivities is that it takes place by daylight, and that the fireworks are of a character to appeal more to the ear than the eye; this may, and at first does, seem stupid, but like many other things which to our agotism seem stupid, it has its good reason. The great festival occurs in August, that is, in the middle of the rainy season, and as the clerk of the weather office in Salvador has ordered that the display of celestial fire and water works shall take place almost daily in the evening, the managers of the earthly display have wisely yielded to the necessity of the case.

We "strook" several other fiestas during our travels, for these are a feast-loving people, and extremely fond of fireworks at all times, so that there seems to be a constant fusillade of rockets and bombs going on. They are also fond of music and of military display. The soldiers are kept drilling and parading and dragging Hotchkiss guns about by means of oxen, while a fine band of 50 pieces, under a German master, has no sinecure but may be heard from early morn to thunder-storming eve, playing marches in the streets or operas in the plaza. Those who claim to be judges say this band is equal to the best of ours. I thought many of the marches very pretty, and the only fault I could find with the opera was that which I always find in that class of music—I didn't understand it.

The Chief of Police of San Salvador is an American named Fitch who takes his life in his hand every day of the year. The Government Engineer is another American named Lord; and the best and most trusted, though not the highest officer in the army, is Col. Sherington, an Irishman, who was formerly in the British army, and was not far from the scene when the Prince Imperial was "abandoned" to be killed by the Zulus. By all accounts it was the skill and gallantry of the colonel, backed by the courage of his troops, that won the battle in which Gen. Barrios was killed, and which was jeopardized by the cowardice and treachery of the native officers, some of whom he found in a house during the battle sorting cartridges for their soldiers. Sherington was the only colonel in the army of Salvador who was not promoted for that day's work.

The best place for a stranger to stay at in the capital is probably the Hotel Aleman, where board and lodging costs \$1 50 per day. American gold commands a premium of 30 per cent.

Salvador is the most thickly populated country on the continent, and ranks, they say, next to Belgium in that respect; consequently there is not much unoccupied good land. It is a beautiful country, less mountainous than Honduras, and it has very fair roads even in the wet season, and they are put in splendid order every year after the rains. The soil has been formed from volcanic rocks, and, as is always the case with such, is very prolific. These countries are generally supposed to be unhealthy; for my part I was as well in Central America as anywhere else. My companions were eating quinine nearly every day; I, "the only delicate one," as one of them said at the start, took a single quinine pill in four months, and I was not sick a day. Of the others, each of whom was indisposed more or less, only one was dangerously ill, and he got sick before landing, probably from much food and little exercise on the steamer, or perhaps because he neither smoked nor took his liquor as all the rest of us did; finally, I suppose, because he couldn't help it. That the climate is debilitating to our people cannot be denied.

As to eating fruit, I ate about all I could get, which was not always as much as I desired, but not between meals, nor unless it tasted good to me; as soon as the flavor palled, or I no longer perceived the delicate aroma, of the banana for instance, I stopped. I think this is a good rule. I never saw a ripe orange in Central America, though I saw splendid trees with trunks over two feet thick and loaded with fruit. I suppose they do get ripe sometimes, though I am told that birds or insects destroy all ripe fruit, but a Central American orange half ripe is better than a Californian when quite so. I could say a great deal more about this interesting country and its people, but as my stay was, but must close for the present at least.

#### Pritchard Creek, Cœur d'Alene.

EDITORS PRESS:—The outlook for the coming season in this particular part of the camp is not at all flattering. There is but little snow in the mountains compared with other years, and what little there is seems to be going off very fast. The weather has been warm, with considerable rain, since the first of present month. From present appearances the run of water or mining in side gulches will be quite short this season, as I believe there is not a single placer mine being worked on Pritchard creek. The output of our placers will be necessarily small, still we have hopes in our "Old Wash" making us happy yet.

One of our quartz-sills and its belongings was sold at sheriff's sale a short time since, and

now the Golden King Mill and Mining Company, which started up a few weeks ago for the 17th time, but lastly under new management, has very unceremoniously shut down without paying their bills or help, consequently attachments are the order of the day. But a few months may make a great change here for the better, and I hope to be able to write a more cheerful account next time.

Mr. Pritchard, the discoverer of this mining camp, lost his two-story hotel (the only hotel in the town of Eagle) by fire about one month ago; the district records and postoffice, kept in this same building, were also destroyed.

R. V. W.

#### Tuolumne County Mines.

##### Soulsbyville.

EDITORS PRESS:—I am informed that J. Clark has disposed of his interests in the North Star mine to a San Francisco company. They have taken the water out and commenced work, drifting. The shaft is down 200 feet and there are large bodies of ore in sight, the vein being several feet in width.

The superintendent, Mr. Brown, informs me that this company is going to erect a steam-hoist on the Luria mine. This mine was worked in former days, and it is said that some fine ore was taken out. The vein is six feet and over in width. There is a fine ten-stamp mill near the above two mines belonging to the company, and all that is wanted is good ore and plenty of it, and the mill will then be heard pounding out the gold. I sincerely hope this company will take out millions.

It is expected that a company will commence work on the Wheel Perrin mine in the near future. It is situated 400 or 500 feet west of and running parallel with the Soulsby mine.

The Soulsby mine is closed down at present, only running the pumps. It is to be hoped that they will commence work in a short time; no doubt there is plenty of good ore remaining in the mine yet. All that is required is money to open it out. They had a fine chute of ore in sight when work was suspended. Mr. John Leechman, former superintendent of the mine, arrived in town Sunday from San Francisco.

The Independent, like many other good mines, is still idle. This mine is situated about 400 feet to the east of and running parallel with the Soulsby and is owned by Messrs. Shorwood, West and others. There is a good vein and good ore has been taken from this mine, and no doubt if the mine was properly opened it would make a good property.

The Live Oak, located at the south and being the same vein as the Black Oak, is idle, and as the Black Oak is running in full blast and looks well, there is no doubt but what the Live Oak is also good, if capital was available to open it.

Mr. W. H. Barron, one of the leading merchants of this place, has a mine located two miles north of here. He has sunk a shaft 85 feet in depth and run levels connecting with another shaft. The vein is 12 to 18 inches, and the ore shows gold. Mr. B. hopes to get capital this summer to open what he thinks to be a good property.

The owners of the Soulsby gravel mine are trying to get men to open their mine the coming summer. They claim it is an old river-bed, and I am of the same opinion myself. They have sunk a shaft 95 feet in depth, and the different kinds of ground they went through is enough to convince any one that they are near an old channel; \$500 invested will test it thoroughly, and no doubt a river-bed would be opened that would contain its thousands. Men with capital should examine this claim, and I am sure they would have the same opinion as many others. The small amount of \$500 would test it, and is not much to risk by men with capital, but to the owners it would be considerable.

MINER.

Soulsbyville, Cal.

#### Restricting Miners to One Claim.

EDITORS PRESS:—I see by the PRESS that Mr. Stewart of Nevada has introduced a bill to change the mining law, restricting a miner to one claim on a vein or lode, and to prohibit a man relocating a claim by him once abandoned or forfeited. In your remarks you seem inclined to favor the measure, but are doubtful of the efficacy of any measure to prevent the claim being secured somehow.

Are you quite sure that such a measure will be beneficial to the mining community at large? In the first place, who is to say that two claims are on the same vein before such is proven to be the case by actual connection? I am sure every miner will bear me out when I say that such connections are easily made, and if ever made, there are generally breaks or faults, that still leave the matter in doubt. It seems to me that the opening for litigation is quite sufficient, without making more unknown quantities.

In the second place, if a mine can be traced further than one claim, who has a better right to it than the finder? It may be he has spent years looking for such a mine, and every one knows how much more easy it is to sell a mine, or to enlist capital, when controlled by one man or company of men, than when there are diverse interests. As all syndicates usually try to get hold of all the property contiguous to the

mine they intend to purchase, if for no other reason than to shut out litigation, it seems nothing more than fair that if a prospector is to be allowed more than one claim, he ought to be allowed those claims as close together as possible. Again, how many men could be lucky enough to get the best claim in a new district at once? In fact, experience has proven that it is the exception rather than the rule. I have a property on which I have done a great deal of labor, and until late last fall I could not have taken a claim out of the lot and secured the main ore chute. I think Mr. Stewart will do more real injury to actual prospectors than even that stupid Alien law has done to the whole community.

As to prohibiting a person relocating a claim he has once abandoned, the object is to prevent men from defrauding the Government, by letting their claims lapse and being on hand Jan. 1st to relocate.

It seems a hardship to forbid any man from ever relocating a claim once abandoned in good faith, because he may at some future time see some encouragement to renew his efforts, and perhaps succeed, whereas he is debarred from that, because he once had a location on that ground. Now why not debar a man for a certain length of time, say three months? Surely in that time no one could say he was trying to defraud any one. If after three months no one wanted the abandoned claim, he would then be entitled to relocate it if he saw fit.

Then again the law says, "that a claim is forfeited on Jan. 1st unless \$100 worth of labor or improvements has been done on it, or the party has resumed work." If a party can hold a claim by resuming work on Dec. 31st and work Jan. 1st too, where is there any law to compel him to finish the \$100 worth of labor? And again the law distinctly says the labor must be performed "within the year;" how can any one reconcile that section?

I think if it was made imperative that the labor must be finished before the 1st of January, that no person was entitled to relocate a claim by him forfeited or abandoned for at least three months after Jan. 1st, the date of such forfeiture, a great deal of the seeming trouble would be obviated.

It is useless to try to make laws to suit everybody. There are always plenty of law fellows following up the actual workers. My way would be to give the latter all the advantage possible.

C. B.

Gibbonsville, Idaho.

HARDWOOD LUMBER FOR HOUSE-FINISHING. —A Chicago paper says: In other countries the general use of hardwood lumber is taken as a matter of course. But little more than 10 years since it would have been hard to find a firm in Chicago doing business in hardwood lumber exclusively, except perhaps for use in the manufacture of furniture. To-day this is entirely changed. No house of any pretensions is erected that has not more or less hardwood trimming, and usually in the entire trimming, as well as the floors, nothing but hardwood is introduced. This is not altogether because the architectural taste has changed, but largely because many of the hardwoods, such as maple, ash, oak, and even cherry, can be furnished dressed for less money than the same grade of soft pine can be obtained. One firm, and probably the largest in the line in the West, Hayden Bros., have a yard covering six acres of ground, in which there is nothing but hardwood lumber. The yard is centrally located, with ample track facilities, and within it is piled over 6,000,000 feet of hardwood lumber of all descriptions. Sheds are built for the storage of fine mahoganies, etc., and large drying kilns enable the firm to deliver kiln-dried lumber on short notice, and not only supply the local market, but ship to all parts of the country.

THE Trinity Journal says: Mesere. Steinberger and Chapin returned Monday from Cox Bar, where they went to examine the coal deposit. Mr. Steinberger is an expert in coal, and says he was greatly surprised in the quality of the vein there—he did not expect anything. It is rumored that the gentlemen were taking notes of the most feasible route for a railroad across Trinity county to Humboldt, not only to connect the northern coast with the upper Sacramento valley, but also to tap our magnificent forests of sugar pine. They procured a topographical map of the county and ascertained the height of different passes, also something of the "lay" of the country. They returned to San Francisco Tuesday. We expect their visit will result in great benefit to Trinity. There are traces of coal found from Cox Bar through Hyampom to the South Fork mountains. If these prospects develop into a deposit of any quantity, the railroad is bound to seek the coal. With or without coal, we have an idea that a railroad will cross the county inside of 10 years.

WELDING MALLEABLE IRON.—Malleable cast iron may be welded together or welded to steel or iron by the same process as you would weld two pieces of steel. Experiment first with two useless pieces. A few attempts will cause you to become an expert at the business.—Blacksmith and Wheelwright.

ENAMELING PAPER OR WOOD.—An impervious enamel for paper, wood, etc., is a solution of shellac in methylated spirit. A coating of this is applied, and then another coating laid at a high temperature and under great pressure.

#### Amending the Mining Laws.

EDITORS PRESS:—I send you a copy of a letter I have addressed to Senator Stewart in regard to the amendments he proposes to make in mining laws. I shall be glad if some of your readers will give their views on the suggestions I make. I think it is very important that persons opening lodes by means of a tunnel should be compelled to do some work on all claims they hold so as to identify them.

A PROSPECTOR.

The Hon. William M. Stewart, United States Senate, Washington, D. C.

SIR—I see from that excellent weekly journal, the MINING AND SCIENTIFIC PRESS of San Francisco, that you have introduced a bill in Congress to amend the present mining law. It is time that an end should be put to the system of holding mining claims year after year by merely relocating them. I know of cases where prospectors have held dozens of lodes from six to nine years, without doing an hour's work, by following that plan. I do not believe, however, that your proposed amendment will end the evil alluded to. Your making it illegal for the holder of a lode to relocate it would not prevent him from getting a friend to make the relocation for him. That is exactly the plan followed now. A claim-owner rarely relocates in his own name. There is only one way to stop the present practice, and that is to compel a locator to do work before he can acquire title. An amendment might be made to the present law as follows:

"Be it enacted that from and after the passage of this amendment, no record of a mining claim shall be valid until the sum of \$100 has been expended upon or beside its outcrop, and a certificate that said work has been done in good faith and of full value according to the rate of miners' wages prevailing in the district, verified by the locator, under oath, before a proper officer, has been filed with the recorder, who shall thereupon, and not previously, file the location notice for record. If said work is not completed within 60 days from the date of discovery, or location, the ground shall be subject to relocation, and such work, when done, shall not count as part of the annual assessment labor, as now required by the Act of Congress to which this is an amendment.

"It is also provided that the provision in said Act of Congress which admits of work being done in a tunnel running for a lode, without working upon the outcrop, shall, in the case of locations made after the adoption of this amendment, be applicable only after \$100 have been expended in exposing and identifying the lode, or lodes, for which said tunnel is being opened."

If a man believes a lode is valuable, he will do the work required by an enactment as above suggested. It will prevent men who are unwilling to do such work from holding mineral lands, dog-in-the-manger style, and if it does seem to press hard on men that are physically weak, it will have the good effect of causing them to abandon an untenable position—that of trying to hold quartz lodes without work, when work is absolutely necessary to give them value.

Your other proposal, to limit a locator's right on a lode to one location, will be easily evaded also, if it becomes a law. The discoverer of a lode will get friends to take up as many extensions in his behalf as he may desire. I do not think it would be wise to adopt such a limitation, my reasons being the following:

There is still a large amount of practically unexplored mineral land on the Pacific Coast. It is good policy to encourage exploration, and one claim in a new district is not sufficient to do that. If a locator finds that some idle fellow has taken up the continuation of his vein and intends to wait until he sees if the original opens well, he is checked in his operations by a knowledge of that fact. On the other hand, if an explorer were permitted to take up as many claims on a lode as he was able to do work upon to the extent of \$100 before making a record, I do not see that the Government, or individuals, would be injured by his having that privilege. He might be able to sell one of his locations, and so get money to open another, and thus start a new industrial center, as was done by the discoverers of Tombstone district, Arizona, when they sold the Contention claim.

Your proposed amendment might, if it became a law, cause costly and even ruinous litigation. Suppose a prospector found a "blind" lode that was "faulted." He might, by the faulting of the vein, think it had a particular course, and would stake off his ground accordingly. Some hundreds of feet off he might find another outcrop, and that, too, being thrown out of its true course by dislocations, he would feel himself justified in claiming it as a distinct lode. After years of development, the two locations being formed on one vein, the courts would declare the second location invalid, thereby occasioning heavy loss to innocent purchasers.

Your practical mining knowledge will enable you to see the importance of the above suggestions. I hope that miners will give attention to the subject through local and mining journals, and after due discussion there may be enacted such amendments to our otherwise really excellent mining law as will make it practically perfect.

A PROSPECTOR (for 25 years).

Now that a number of old prospects which for the past few months have been worked are developing good, would it not be wise for others to work their old claims?—Pitche Record.

## Passing Events.

The heavy storms of the past week have added materially to the accumulation of snow on the mountains, so that we are sure of a good water season this year for the miners. The farmers have had all the rain they need, too, so that a prosperous year will doubtless result.

Considerable attention is being directed to the mines in Washington Territory and Oregon, and both these regions will be better prospected than ever this summer.

Although no good and steady flows of natural gas have been found in this State thus far sufficient for industrial purposes, a number of places are being prospected for it, where there are good signs of its existence. With the growth of the petroleum industry, and the increase of productive fields in California, more prospecting for this is also carried on, the business being now a profitable one.

Coal and iron still continue at high prices, the former especially. Prospecting for coal is now going on all over this State, and several companies have been formed for the purpose. No coal of very good quality has ever been found in California, but some good coking coal has been found in Washington Territory.

WITHIN a circle of 25 miles around Rawlins, Wyoming, there is said to be sufficient coal, iron, copper and borax to make it a city of 50,000 people within the next five years.

## Sierra County Mines.

We had a conversation this week with Mr. T. D. Calkins of the Sierra Tribune, which is one of the best interior exchanges, that makes a specialty of gathering the mining news of its locality. The Tribune is published at Sierra City. The town has been in a state of quarantine for some months, but the smallpox scare is now over. Mr. Calkins informs us that the mining situation in that region is very favorable and great activity is expected this summer. He says that the mine just now attracting the most attention is the Mountain mine, across the lake from the Young America. It was sold a short time ago by Harry Warner for \$60,000 to Sunderhaus. They employ 25 men at present; they have no mill, but expect to erect a 40-stamp mill about the 1st of May on the North Yuba. The mill will be run by water-power.

The Salinas and Mercer 10-stamp mill started up about two weeks ago. It is near the Keystone mill in the Keystone district.

Sacred Mountain mine is a new mine. They are running a tunnel, have some very fine ore, are working a few men. There is another ledge on the other side of the river, the Banner mine. They are running a tunnel there; have one in about 100 feet, and have a four-foot ledge there of very good ore.

The Marguerite mine is in litigation and is lying idle at present. The Keystone mine was bought by ex-Sheriff Mead a few months ago. He is working 25 men there and expects to do well in the spring. He has another mine in connection with that one.

The Young America is working 150 men; they have just declared a dividend of two per cent with 15 days' run in the month; 500 shares in the mine. Their rock runs from \$10 to \$13 per ton. They have a 40-stamp mill, and as they run by water-power their expenses are very light.

The Sierra Battes have about 300 men at work. They are building a new mill of 20 stamps in place of the old 50-stamp mill that burned down. They run by water-power. They have much better prospects in the long tunnel than have been shown for some time. The Yuba mill of 60 stamps runs night and day on ore, and the chlorination works run steadily.

The Golden mine will have to have its tunnel in 970 feet before striking the ledge. The San Luis mine expects to put up a staop-mill in the spring. They expect to tap the vein along the 1st of April or May, and will put up a ten-stamp mill. It has some very fine ledge ore on top. It is south of town, upon the same hill as the Marguerite. The Salinas and Mercer have a five-foot vein; it looks very fine, and their ore will pay all the way from \$10 to \$15 or \$20 per ton. The Mountain mine is one of the biggest things ever discovered in this State. You can stand several feet off from the ledge and see the gold in it. The party who sold it has owned it for the last 20 years. It is one of the most important discoveries we ever have had there. It is a bigger mine than the Young America. During the last year almost every tunnel that has been run there has proven a success. The Keystone mine is right near town. They have put up a four-stamp mill—just started up a month ago. They struck some very rich ore there—regular bonanza rock. The Buffalo mine has made partial arrangements to put up a ten-stamp mill there. The Primrose mine is in the same canyon that the Buffalo mine is. They expect to start up their mill as soon as the snow is gone.

The Gold Bluff mine, at Downieville, has struck some very rich ore, and is doing well. It is the only quartz mine at Downieville that is doing much. Gravel mines are doing pretty well.

Mr. Busch of the Young America is interested in the tunnels over there. Sutherland, now in Scotland, is interested in the quartz mine over at Poker Flat. I think this summer we will have probably 1000 miners employed around Sierra City. The Mountain mine alone will employ 200 men, and the Sierra Battes always employs 300 men. The camp will do better this year than ever before. In the Gold Valley district they have from eight to ten feet of snow. The most we have had this year has been five feet on a level. Gold Lake is about ten miles from Sierra City.

At last Placerville has railroad connection and is happy.

## The Plymouth Consolidated.

## A Big California Gold Mine.

The Plymouth Consolidated is one of the largest producing gold mining companies in California. In 1887 the mines of the company produced \$736,304.75, and the operating expenses were \$297,404.26. This left a profit of \$438,900.41. From this 12 monthly dividends were paid, aggregating \$375,030, and \$46,861 was spent in construction. The surplus, January, 1888, was \$98,118.91. In the construction account was the cost of the addition of 40 stamps to the Pacific mill and the electric-light plant.

This company was formed June 1, 1883, by the consolidation of the Empire, the Amador Pacific, and the Plymouth Companies. The mines were well developed, and a considerable amount in dividends has been paid. Prior to the consolidation, gold bullion to the amount of about \$2,500,000 had been produced.

The following is a statement of all the receipts and expenditures of this company from its organization, June 1, 1883, to January 1, 1888, a period of four years and seven months:

June 1, 1883.—Cash on hand at time of organization of this company.....	\$153,319 80
Gold Bullion Produced by the Mines as Follows:	
To Jan. 1, 1887.....	\$3,063,194 69
For the year 1887.....	736,304 67
	\$3,804,499 36

Total receipts.....	\$3,957,819 16
---------------------	----------------

Disbursements:	
Operating expenses.....	\$1,442,074 08
Construction (since June 1, 1883).....	217,626 17
Fifty-five dividends, averaging \$40,000 each.....	2,200,000 00
	\$3,859,700 25

Cash on hand Jan. 1, 1888.....	\$98,118 91
--------------------------------	-------------

The heavy and regular dividends paid by this company are made from ore of no high grade. The average yield of gold last year was \$7.59 per ton. There is no place in the United States where cheaper mining and milling can be done than in California.

During 1887, except when short of water, both the mills ran with great regularity and crushed in the aggregate 97,000 tons of ore. The figures of yield and cost are as follows:

Average yield per ton, 1886.....	\$9 18
Average yield per ton, 1887.....	7 59

Increase yield per ton.....	\$1 41
-----------------------------	--------

The cost of production in 1887 was as follows:

Per ton.	
Mining.....	\$3 32
Milling.....	30
Saving and reducing sulphurets.....	17
General expenses—office, taxes and prospecting.....	17

Total average cost, including all expenses.....	\$9 07
---	--------

The average cost was increased by the remarkable drought, which so reduced the supply of water that for weeks but one-half, and frequently but one-quarter of the stamps, could be run. It was not until the last week of December that rain fell in sufficient quantities to run all the machinery. The almost entire absence of rain for three months after the usual time is unprecedented. Heavy storms have since followed, and an abundance of water is now assured by accumulation of snow in the mountains.

The company's property is at Plymouth, Amador county. They own land a mile in length on the line of the mother lode. The principal mine consists of an immense chimney of ribbon quartz from 30 to 50 feet wide and 315 to 450 feet long. The ore mills freely, and contains from one to two per cent of sulphurets. There are four shafts, three of which follow the vein, and the fourth—the Pacific—is vertical. This latter has three compartments and is equipped with superior hoisting machinery. Self-dumping automatic skips are used, hoisting 3000 pounds of rock each, with English flat-wire cables. The derrick frame is 76 feet high. On the Pacific claim, level No. 1 is 1060 feet below the surface, and level No. 7 is 1600 feet below the surface. The temperature of the mine is moderate, and very little trouble is experienced from water. No pump is needed, a bucket running a few hours a day keeps the mine dry.

The two mills have an aggregate of 160 stamps which crush 400 tons a day. Connected with the mills are 48 Frue concentrators for saving sulphurets. The Pacific mill is one of the best equipped in the United States. The chlorination works have proved a gratifying success. All the machinery on the property is run by water-power. The water is supplied from the company's own canals, except that used in the Pacific mill, which is furnished under an old contract with the Amador Canal Co. Steam connections have been retained at

the shafts, so that in the event of accident, a change could be made from water to steam at an hour's notice. The quartz-mills are the largest in the world, with one exception. The secretary of the company, P. Wendover, Bedford, states in his report that a piece of rock one foot square and one mile in length represents the amount crushed by the Plymouth mills every 24 hours.

The company owns extensive water works. In addition to the several reservoirs there are canals as follows: Main, 25 miles long, runs from the middle fork of the Cosumnes river to Plymouth; South Fork, or Bridgeport, 20 miles long, runs from main fork of the Cosumnes to a point one mile northeast of Plymouth, where it joins the Main canal; Simpson, 22 miles long, runs from the south fork of the Cosumnes river to the reservoir, two and one-half miles northeast of Plymouth. Douglass, 34 miles long, with lateral branches aggregating 15 miles more, conveys water from middle fork of the Cosumnes river to Indian Digging; Tyler, four miles long, runs from south fork of the Cosumnes to reservoir at Tylers ranch.

In addition to the above there are several branches, and also canals leading the water from Plymouth to the country below, in all about 40 miles, the whole system making a total of 160 miles of canal owned by the Company.

The water used for power is conveyed from the Simpson canal reservoir, two and one-half miles, in iron pipe of 18 inches diameter. At the Empire and Woodford shafts a pressure of 550 feet is obtained, and at the Pacific shaft a pressure of 561 feet.

To communicate this power to the machinery no less than 23 wheels are required. Of these three are turbine wheels, of the kind known as the "Lafel" turbine. The remaining 20 are "hardy-gurdy" wheels. They are of three varieties, the "Knight," the "Donnelly" and the "Pelton." These water-wheels now run all the machinery on the property, including mills, hoisting gear at the shafts, sawmills, blowers, rock-breakers, concentrators, air-compressors, ventilators, blasts and machine shop.

The canals are also utilized to bring to Plymouth timbers for the mine. Seven or eight thousand logs a year are used. They are large and heavy. Instead of being hauled over difficult roads at great expense, they are easily floated down the canals from the mountains and dropped into the company's yard, almost without cost for transportation. The improvements have cost over \$500,000, in addition to what has been expended in development of the mine and for operating expenses. The superintendent, Mr. E. L. Montgomery, has had charge of the property since December, 1879, while Mr. Wm. Jones, the foreman, has nearly completed his thirteenth year of service. Mr. J. J. Herr has directed the affairs of the office at Plymouth for seven years.

## Foundry Notes.

Mr. J. B. Pitchford, mechanical engineer and draughtsman, who has long been connected with the Risdon Iron Works, has now associated himself with Rix & Firth of the Phoenix Iron Works, 18 and 20 Fremont street.

The Union Iron Works has completed a 60-horse power engine to run the stone-cutting machine at the Rocklin quarries. This machine is expected to do the work of 20 stone-cutters. The engine will also aid the hoisting and other work about the quarry and shops. It will be used at Griffith's quarries, where about 60 men are employed.

Mr. Wm. H. Hampton of Portland, Oregon, writes us that the Oregon Iron and Steel Co. have resumed work at their plant at Oswego after having been shut down for three years. They are building an entire new set of furnaces of the most recent and approved type and expect to "blow in" about June 1st.

The Pacific Rolling-mills give steady work to some 700 men. In addition to the usual work of a rolling-mill, they are doing a good deal in the direction of building cable railroads.

The Fulton Iron Works have several marine engines on hand for auxiliary steam schooners for the coasting trade. A great many of these vessels have been built within the past two years, and have been found to be much more profitable than the sailing schooner so long used in the lumber trade.

### A New System of Teaching Geography.

In the ordinary method of teaching geography in the schools, maps or charts are employed, either complete with colored subdivisions or in outline, but these maps do not always convey very clear impressions to the youthful mind. The maps are all made and there is nothing to firmly impress upon the children the proper idea of the geographical division. Willie M. Bours of Stockton, California, has applied for a patent on a map or chart for teaching purposes, in which the general outline of the whole State or country is made, and within this exterior outline are dots or points so placed that lines drawn through these points will give a general outline of the subdivisions of the country or its configuration, and from these general outlines the more exact indications of the configuration may be drawn. The pupil can therefore draw the various lines indicating the general shape of the subdivisions and may afterward make the more exact contour lines therefrom, thus gaining knowledge of the size, proportion and general appearance, which it is impossible to obtain from completed maps.

Mr. Bours calls this a "Lineal System." The objects are to assist the pupil to grasp the territorial relations of the divisions of a country, and to aid the pupil in the practice of this knowledge by giving directions for its application. The use of the system may be exemplified in a study of the geography of the United States. An outline engraving of the United States is shown on this page, with the dots or points indicating the corners or extremities of boundary lines of the States and Territories.

The general outline only follows the more prominent irregularities of the coast or boundary. The dots are placed in such position that lines drawn from these points or dots will show the general contour of the internal subdivisions of the State. By the aid of these dots the pupil will soon learn to construct all the subdivisions of the country; first, in general outline by drawing approximate straight lines through the dots, and afterward the more minute irregularities of contour may be indicated by dotted lines. For instance, the line drawn from *E* to *F* would indicate the southern border of Washington Territory (or northern boundary of Oregon) in an approximate manner, while the dotted line *e* would show the more minute contour. The line *M* would indicate the general contour of the coast of Texas, while the dotted line *m* would show the features more in detail.

The straight lines are used, to suggest the division of a country, to answer to straight-line boundaries, and for guidance in drawing boundary lines that are not straight. To draw the boundary line of California (the coast being already shown in the general contour) the pupil would make a straight line from *G* to *H*, from *H* to *I*, from *I* to *J*, and from *J* to *K*. Then to get the correct southeasterly line the dotted line *I* would be drawn.

To bound a division of a country, the pupil would be required to draw the boundary lines of the divisions contiguous to the one under consideration. For an example, let it be required to bound Wyoming. (See 7 on engraving.) The pupil would draw the boundary lines of Idaho (1), Montana (2), Dakota (3), Nebraska (4), Colorado (5), and Utah (6). In making these divisions, the following lines are drawn: *AB*, *BC*, *CD*, and *DA*, which are the boundary lines of Wyoming.

These outline maps or charts may be permanently drawn or indicated upon a slate or blackboard, or they may be drawn on silica slate, where the general outlines and dots may be permanent. Connecting outlines or contours may be drawn with pencil or other marking implement while the lesson is in progress, and afterward erased so as to leave only the permanent outline and dots.

This system is of great use to assist the pu-

pil to understand the territorial relations of the subdivisions of the country, its general appearance as a whole, and the relationship of the various outlines and irregularities of configura-

GILSONITE is being shipped from Utah to St. Louis and Chicago. It costs \$5 per ton to mine and sack it, and \$15 per ton freight. It is chiefly used in the manufacture of paints and

ILLUSTRATION OF THE LINEAL SYSTEM OF TEACHING GEOGRAPHY.

practice with this system will fix the outline in the memory of the scholar better than the mere study or contemplation of a completed map.

THE mills worked 3129 tons of Cons. California and Virginia ore last week, which averaged \$32.67 per ton.

Julia have not completed their labors. Experts are now testing the iron of the boilers.

WM. H. GAYLORD was killed near Wehher creek bridge, in El Dorado county, on the first of March, by a cave in a prospect shaft that he and another young man were working.

### The Macroscopical Examination of Rocks.

The following was read before the California Academy of Sciences by Melville Attwood, at the meeting on Monday evening last:

The specimens selected should have a good fresh surface of fracture—size about three inches by five across, and one and one-half inches through. With a trimming hammer prepare the one and one-half face, so that by rubbing it on emery blocks you can get an even surface or polish on it. Then heat the specimen so that you can barely handle it. When in that condition rub Canada balsam on one-half of the polished surface. When cold it will harden so that you can handle it without injury. (A slice can also be taken from this face for microscopic slides.) By this method the different constituents of the rock are much better seen, and the inspection of the outer surface viewed as an opaque object with only the aid of a common magnifier—say of three powers—set in a spectacle frame, in which the different powers can be easily changed, will, in most cases, give all the information ordinarily required by the mining engineer.

The even surface not covered by the balsam, can then have the hardness of the different crystallized minerals to be seen on it easily determined, and also tested with acids, by applying a fine glass rod dipped in the acid to the different crystallized particles, and by the aid of the magnifier, the action, if any, can be seen.

The best mode of determining the hardness is to have the minerals forming the scale of hardness mounted something like the writing diamond. Break, for instance, the corundum, topaz, etc., into small fragments, and, after selecting those with fine, sharp points, proceed to mount them in the following manner:

Take a piece of brass wire three inches long by one-eighth of an inch in diameter, and with a file, make small notches on one end of the wire. Then take lapidary's cement, warm the end of the wire with a spirit-lamp or candle, and melt some of the cement on to it. By wetting your finger and rubbing the cement while warm, you can mold it into any shape you please. With a small pair of pliers, take the small fragments of corundum, etc., heat one end of the corundum, and then place it into the cement. If properly done, it will answer just as well as if set in metal, with this advantage, that you can renew it at any time, in a few minutes.

ON the great mother lode which runs from Jackson to Plymouth, Amador county, there are about 500 stamps in operation, and not less than 1000 men at work. It is a continued scene of activity from the Cosumnes river to the Mokelumne. The distance between the two rivers is about 14 miles. The mines now working are the Plymouth with 160 stamps, the Potosi with 10, Black Hills 10, Gover 20, Quartz Mountain 10, Keystone 40, South Spring Hill 30, Iowa 10, Mahoney 40, Wildman 10, Kennedy 40, Zeile 40, Moore 10 and Nevills 10. There are several small properties besides these.

THE smelting works at Great Falls, Montana, will be ready to treat ore some time in August. The main building will be 1200 feet long with iron roof, and will contain four 65 ton smelters. The contemplated smelter at Helena will be of similar capacity. These places will afford good markets for Cenr d'Alene ores.

MEADOW LAKE.—Another process has been found to work the Meadow Lake rebellious ores—that is, it is expected to do so. Meadow Lake is responsible for a good many processes, experiments and failures. The trouble probably is that the ores do not contain as much metal as they are supposed to.

## MECHANICAL PROGRESS.

## Machine vs. Hand Work.

A great deal has been said and written about the advantages of the employment of machinery in place of hand labor, which is entirely misunderstood by those who are not mechanics, or at least intimately familiar with mechanical operations. We constantly see such expressions as "the substitution of the unerring accuracy and uniform action of a machine, for the uncertain and ever-varying hand labor." Now, such an expression, while in one sense it is true enough, is, nevertheless, misleading to those not familiar with such matters.

It is not true, except in very rare instances, that a machine will produce work of better quality or greater uniformity than can be produced by hand labor, and the machines are usually employed simply because they will produce work of the quality and uniformity desired at a much less cost than would be the case if the grade of skilled hand labor required to produce equal results were employed. Many of the parts of small machines, such as sewing machines, were formerly filed to shape and size, the quality of the work and its uniformity depending upon the skill of the filers, who were not the highest of skilled workmen. This process has been superseded by milling machines and other operations, by which the cost has been reduced, the quality greatly improved and greater uniformity secured. But the tools, milling cutters, gauges and other appliances, by which this result is secured, are made by the highest skilled labor, and if this grade of labor were employed upon the pieces themselves, they could be made of better quality and greater uniformity than it is possible to secure by machinery.

When a new sewing machine, or a new gun, or any similar article is invented or designed, which is to be made in large numbers, it is the usual practice to first build a sample or model machine, which, when finished, is put to a practical test. When found to be entirely satisfactory it is taken apart, and the pieces which composed it used as samples, by which the gauges, jigs, templates and fixtures are made, by means of which the thousands are to be produced. Now, for the building of this model machine, the highest skilled labor is usually employed, and it is fully equal to, if not superior to, any which are afterward produced by machinery. And, moreover, the same labor could produce a duplicate of this machine, but it would cost, perhaps, a hundred times as much as those produced by machinery, and this is, after all, the real reason for the employment of machinery.

So much has been said on this subject that many will hesitate to believe that there is scarcely anything produced by machinery which cannot be improved by skilled hand labor, if there are economic reasons for such improvement; but nevertheless it is a fact. Take, for instance, the apparently simple matter of the production of a true flat surface upon a piece of cast iron. It is well known among mechanics that the best of such surfaces are produced by skilled hand labor, and all that the best machines can do is simply to rough out, or prepare the surface for the hand labor, by which it is perfected.

There are plenty of machines which will produce holes in steel with a great degree of precision and uniformity, but for superior holes can be produced by hand lapping, and can be had by any one who is able and willing to pay for the increased cost.

Transits, theodolites, levels and other instruments must depend for their accuracy upon the skill of the mechanic who makes them. It is safe to say that the degree of accuracy which is required upon such work will always require skilled hand labor, and can probably never be attained by machinery.

Much has been said on this subject in connection with the manufacture of watches, and the introduction of machinery has accomplished wonders in this department of industry. But, notwithstanding all that has been done, if one wishes to procure the best watch which it is possible to produce, and is willing to pay for it, he must buy a watch which has been made, or, at least perfected, by skilled hand labor.

Up to a certain degree of precision and excellence, machinery is superior to hand labor, but usually only for economic reasons, and it is not true, as many seem to think, that the very highest degree of precision is obtained by machine operations.—*American Machinist*.

**HARDENING CAST IRON.**—The hardening of the surface of cast iron by the well-known process of "case-hardening" has long been understood and utilized; but hardening cast iron after it has left the mold is something quite new. A correspondent of the *American Machinist* says: "To-day I had to turn 16 cast-iron rollers, all of which needed case-hardening, as otherwise they would wear off too fast. We case-harden cast iron by heating it to a good cherry red, apply potash, and dip it into the water, the same as we do for wrought iron." The editor of the *Machinist*, who received the roller, comments on it as follows: "The roller spoken of by our correspondent is about 1½ diameter by 3" wide, and has the outward appearance of case-hardened wrought iron. It is quite hard, not only upon the surface, but upon breaking it we find it hard all the way through, so that it cannot be

filed. The fracture has the appearance of ordinary cast iron. Thus it would appear that this is a method of hardening cast iron which would probably be useful in many places, but it is not a case-hardening process according to the generally accepted meaning of the term."

## Power from Hot Water.

Respecting the power which can be stored up in a boiler surcharged with steam and water at high temperatures, the London *Engineer* makes the following calculation, embodied in an article on the Nordenfeldt submarine boat:

The submarine boat Nordenfeldt uses the system suggested many years ago by Doctor Lamb, and used by him for propelling street cars. If the pressure in a boiler is lowered the temperature falls, and part of the sensible heat of the water becomes converted into latent heat by evaporation. The two boilers contain about 27 tons of water. The pressure of the steam is, let us say, 160 pounds above the atmosphere, or 175 pounds absolute. The corresponding temperature is 371° F. Now, the engines will work well with steam having a pressure of 50 pounds above the atmosphere, or 65 pounds absolute, the temperature of which is 298°. In falling from one of the temperatures to the other, each pound of water gives out 371° - 298° = 73 units. There are 60,480 pounds of water, and 60,480 × 73 = 4,415,040 units. Each pound of steam at 65 pounds pressure will represent 904 units, 4,415,040

and  $\frac{4,415,040}{904} = 4883$ , nearly, pounds of steam of 50 pounds pressure, which can be supplied after the ship has been submerged. Assuming that her engines use 20 pounds of steam per horse per hour—a very high estimate 4883 —we have  $\frac{4883}{20} = 244$  horse-power for one hour.

**PUDDLING IRON DIRECT FROM THE BLAST FURNACE.**—For about three months the North Chicago Rolling-Mill Company has been experimenting at Milwaukee in puddling iron direct from the blast furnace, and now believe they have made the process thoroughly successful. For the past two weeks they have run four double-double puddling furnaces in this way, and the iron made is of very superior quality. They effect a great saving in fuel, lighten the labor of the puddler and his helper, and save a great deal of time. They are able in 1½ hours to get out the usual five heats of a 12 hours' turn. They experience no difficulty in keeping the product of the blast furnace uniform, and have thus far met with no obstacles that they have not been able to overcome. They believe they are the first to successfully accomplish this feat, and predict the inauguration of a new departure in puddling.

**A NEW METAL.**—The English correspondent of the *American Manufacturer*, in a recent letter, says: What may be termed a new metal for application to the special requirements of electrical engineering has just been brought out by Messrs. Henry Wallwork & Co., engineers, Manchester. Castings for two armatures and the other portions of a dynamo which take off the electricity are needed to be of a metal perfectly uniform and even. Messrs. Wallwork use a special mixture and employ a special process of melting, under which the whole operation is carried through one temperature. The result of their experiment is, they claim, a soft metal which has the virtues of a wrought metal and is absolutely uniform in texture. It has been used already for many electrical castings with satisfactory results.

**ANOTHER ALUMINUM BRONZE FACTORY.**—We note that E. Smith of the copper and brass works, Chicago, has started to make aluminum bronze castings. It is interesting to note the rapid progress that is being made in this important branch of industry, from which it is to be hoped the time is not far distant when this valuable metal, a substance of full 40 times the transverse strength of brass, and equal in tensile strength and ductility to the best grade of tempered steel, will be placed upon the market at a price which will make it available for introduction into a great number of important uses.

**GEARING ON BELTING.**—In England the practice of transmitting power from engine to shafting has seemed likely to be almost entirely superseded by rope driving. Now, however, by the use of improved machinery for cutting the teeth of spur gears of large size, they are enabled to use much better gears than formerly, and it seems not improbable that there may be a return to the use of gears for such purposes.

**ELECTRO DEPOSITED STEAM PIPES.**—By a method, practiced in England, for making copper steam pipes, the copper is electrically deposited in the proper form, doing away entirely with brazing. This has been done before, but the strength of the copper has been destroyed. This difficulty is said to have been obviated and copper pipes of great strength obtained.

**TIN FOIL MANUFACTURE.**—An extensive building for the manufacture of tin foil is about to be erected in St. Louis by James Johnson, formerly of the Missouri Lead Company. Large quantities of lead will be consumed to meet the increasing demand for tin foil by tobacco manufacturers, brewers, etc.

## SCIENTIFIC PROGRESS.

## Labor and Food.

The human body never ceases to work. Even in the most profound slumber some of the functions of life are going on, as for instance, breathing, the circulation of the blood, digestion, when there is food in the stomach; and it follows that some part of the nervous system is therefore awake and attending to business all the day and night long. In the act of living, some of the substance of the body is being constantly consumed. The amount of work done by the heart in one day in propelling the blood is now estimated as equal to the work of a steam engine raising 125 tons one foot high, or one ton 125 feet high. We lose in weight by working. Weigh a man after several hours' hard labor, and he will be found two or three, and in extreme cases several, pounds lighter. If we do not wish to become bankrupt, we must replace by food the amount we have lost by labor. Hunger and thirst are the instincts which prompt us to do this. They are like automatic alarm clocks, which stop the engine at various points to take on fuel and water.

In a healthy man as much is taken in as is required to maintain the weight of the body against loss. Nature keeps the account. On one side is so much food spent in work; on the other, so much received into the stomach for digestion. They should balance, like the accounts of an honest book-keeper. In an unhealthy person, the instinct of hunger becomes disordered and does not sound the alarm, and so the person goes on working without eating, until he becomes emaciated; or the instinct works too frequently, and he eats too much and clogs the vital machinery. A calculation of the business done in the body reveals the fact that for a hard-working person about 8½ pounds of food and drink are used up daily; some bodies use more and some less, but this is the average. The profit which the body gets on the transaction has been calculated, and may interest our readers. The energy stored up in the 8½ pounds of food ought to raise 3400 tons one foot high. Most of this energy, however, is expended in keeping the body warm and its functions active. About one-tenth can be spent in our bodily movements or in work. The profit, then, on the process is about 10 per cent. This is enough to raise 340 tons one foot high each day—a profit which is quite enough for earning a good living if rightly expended, and it is probably more than most make, but all ought to strive to reach this point if possible.—*Medical Record*.

**IS CLAY A MINERAL?**—A most curious suit was recently presented before the English House of Lords for adjudication, in which the above question was the issue. The corporation of Glasgow purchased some land at Westham for water works and conduits, and erected thereon a reservoir. In the deed there was a clause included that stipulated for the seller a reservation of "the whole coal and other minerals." Coal seems not to be present underneath the reservoir, but merchantable clay is there, and to it the representative of the original vendor lays claim. The land in the immediate vicinity has been worked for clay almost up to the boundary of the reservoir, and the right of extending the workings regardless of their effects upon the corporation's structures is claimed. Various decisions have been reached in the Scotch courts, and now the case has at last reached the final tribunal. The contestant offers to relinquish his title to the clay for the modest sum of £10,000, only £1000 less than he originally received for the property. The scientific fact that clay is a mineral is admitted, and also under the Railway Clauses Act, it is conceded that it may be considered such. The Scottish courts present at least a majority of opinion against the corporation. The point that clay is an ore of aluminum strongly indicates that it is in the economical sense a mineral. It will be interesting to see whether the Scotch hailies will prove to have been outwitted by an over-clever seller.

**A UNIVERSITY FOR CHICAGO.**—Chicago is in a fair way to become the possessor of a university worthy of such a great and growing city. It appears that Mr. Harry Farber (a relative of Mrs. Cleveland), who is at present studying law in Vienna, has offered to Minister Lawson, U. S. Envoy to the Austro-Hungarian Court, the munificent sum of \$1,000,000 for the purpose of establishing in Chicago a university planned upon the principle of those which govern similar institutions in Germany and Austria.

**FOR THE CONCEALMENT OF TORPEDO BOATS.**—A series of experiments has been made at the Rochefort Arsenal, France, with a view to provide for the concealment of torpedo boats in action. The apparatus used prevents the escape of sparks and fire, and it is said that it reduces the temperature of the smoke to 100°, at which temperature, instead of rising, it spreads over the surface of the water, concealing the boat.

**A PECULIAR BOILER DEPOSIT.**—A correspondent of the *Stevens Indicator* writes as follows in a recent issue: One of a battery of boilers at an iron plant was painted inside with a mixture of graphite and linseed oil. The boiler was filled with water and stood idle for several

months, when it was put in use. Being troubled seriously with priming, the boiler was opened and a rather curious deposit was found. It consisted of masses of an irregular spherical form, porous and spongy in structure, ranging from one inch to six inches in diameter. They were soft and held a large amount of water in suspension, which could be squeezed out as from a sponge; color, a dark lead, which became lighter as they dried out. On drying, the masses became hard and friable, but still retained their porous structure. When gently heated in a crucible, fumes were given off, and the mass became reduced to a powder of about one-tenth its original volume. A cold glass plate held in the fumes showed a deposit of water and oil, which, with the characteristic smell and aforementioned circumstances, proved to be linseed. A chemical analysis of the residual powder proved the presence of graphite in large quantities, and small quantities of calcium, magnesia, iron and aluminum. Before being put into use again the boiler was painted inside with a mixture of crude petroleum and graphite, and no further trouble was experienced.

## Electric Sunstroke.

Under the above heading *Engineering* of London directs attention to a paper recently read before the French Society of Surgeons by M. Defontaine, doctor-in-chief to the Crensat Steel Works. M. Defontaine states that workmen employed in operating the electric forges at Crensat are subject to a form of sunstroke, which he attributes to the intense light radiated from the focus of the forge. Ordinary arc lamps are incapable of producing such effects, as the light is not sufficiently intense, but these forges emit a light of more than 100,000 candles from a few square centimeters of surface, producing on men exposed to their glare physiological consequences previously unheard of. Frequently, after two or three hours' work, the men complain of pains more or less intense in the neck, the face and the forehead, simultaneously with which the color of the skin is changed to reddish-brown. Further, in spite of the precaution taken by the men of shielding their eyes with dark glasses, the retina is affected to such a degree that for some minutes after ceasing work the operatives are totally blind to all objects illuminated with common daylight, nor is perfect vision restored until nearly an hour after. The conjunctiva are irritated, and remain in a state of congestion for 48 hours, and this is accompanied by a painful feeling as of some foreign body introduced under the eyelids. The secretion of tears is augmented, a constant flow being kept up for 24 hours, during which the patient suffers from insomnia, due to pain and the abnormal flow of tears, and possibly also to fever. During the following days the skin peels off the face and neck, which become of a deep red color, fading away about the fifth day. In cases of ordinary sunstroke heat may have some influence, but in those considered above the whole effect is due solely to the action of an intense light.

The value of the observation lies in its suggestion as to the way in which sunstroke of the indicated type is produced. It suggests, for instance, that the whole matter may be a question of the rapidity of the vibrations originated by the luminous body, whether those that are known under the name of light or those slower ones that are described by the word heat. Molecular changes in the system due to heat, or light, or both, produce in some way not yet definitely explained the affection known as sunstroke. Whatever throws light on the conditions or nature of these changes helps to clear up a very obscure and puzzling subject, specially related to the functions of the nervous system, and hearing at the same time on the mechanics of ethereal vibrations. Heat, light and chemical effect are all connected, and very possibly all involved in this particular problem. It offers magnificent possibilities for students who have the courage and patience to attack it.

**MODEL OF AN EARTHQUAKE.**—The recent study of earthquake phenomena has led to quite a multiplication of mechanical devices for determining the character and extent of the earth movements caused by such disturbances. The latest is described in a recent number of the *Journal of the Science College of the University of Tokio*. Professor Sekiya describes a very curious and remarkable model he has made to exhibit the manner in which a point on the earth's surface moves during an earthquake. Those who have followed the recent progress of seismometry in Japan are aware that the motion which is recorded at an earthquake observatory is a prolonged series of twists and wriggles of the most complicated kind, so that the path pursued by a point on the surface of the soil has been aptly compared to the form taken by a long bank of string when loosely raveled together and thrown down in a confused heap. Professor Sekiya has taken advantage of a very complete earthquake record obtained by him with a set of Professor Ewing's seismographs to follow out this path step by step, and to represent it in a permanent form by means of stiff copper wire. The earthquake he has modeled in this way took place on Jan. 15, 1887, and was unusually severe for Japan. The model represents the absolute motion of the ground magnified 50 times, and shows at a glance the real character and enormous complexity of earthquake motion.

## USEFUL INFORMATION.

## How to Prepare Rouge for Polishing Metals.

As the rouge found in the market does not meet with the requirements of the workmen, at least for every metal, observes the *Universal Tinker*, we give a very simple metal which allows the workman to prepare for himself just the quality and quantity necessary for his particular work. Heat sulphate of iron of as pure a quality as can be obtained (also called green vitriol) in an iron vessel over a slow fire, stirring it continually with an iron spatula until it is dry and takes the form of a pale greenish-yellow powder. This powder, after being crushed in a mortar and sifted, is to be calcined in a new crucible and exposed to the fire of a smelting-stove as long as vapors arise from it. As soon as no more of these can be observed the contents of the crucible may be left to cool, and when cool will appear like the rouge used for polishing. Its color may vary from pale red to brown-red, or even to blue or violet, but these variations arise only from the different degrees of heat employed, and it may be observed that the higher the temperature has been during the process, the darker the color and the powder—a fact which also explains why the pale-red powder is used only for gold and silver, while the violet is used for steel. No matter what the color is, it is very important that the rouge be well bruised and washed in water before it is used. For this purpose three clean glasses are taken, and one of them is filled with pure water, in which a part of the rouge is mixed by stirring it for some time with a small piece of wood. After allowing about half a minute for the rouge to settle to the bottom of the glass, the remainder of the red liquid is decanted into the second glass, but every particle of the deposit must be left in the first one. The same process has to be observed also for the second and third glasses, but with this difference: the powder in the second glass is allowed to settle about two minutes, while in the third one it is left for several hours, that is, until the water resumes its natural clearness. The sediment of the first glass is almost valueless, that of the second of medium quality, but that of the third glass is of very good quality and fit to be used with great advantage after it has been slowly dried. In some cases the rouge thus obtained may be mixed with grease, and generally it will be found of great advantage to moisten it with spirits of wine and burn it in a clean iron vessel.

## A New Process of Veneering.

*La Construction Moderne* gives a few interesting details of a new process of veneering with all descriptions of wood, etc., which may be of interest to manufacturers. It is said that these veneers fully preserve the appearance and qualities of the massive wood. The veneers are pasted on strongly resisting sheets of paper and in that state sold to the trade. These veneers can be handled quite as easily as tapestry paper, and are useful for various purposes. They have all the qualities of the wood in full size, and can be quite as easily washed, varnished, etc. The mode of application on surfaces is very simple, but a certain amount of care is, nevertheless, required, especially when great duration of work is desired. All the grooves and fissures, etc., must first of all be filled up with putty of a good quality, or plaster if it should be a wall. If the wall is new, it must be washed with a warm solution of glue (1½ pints of glue paste to 14 pints of water). When the glue is dry the wall may be polished with emery paper. If the object has already been papered, the old paper must be removed before the veneer is applied. In cases where the object has been painted, it would be necessary to rub the paint with rough emery paper first and polish it with the finest kind afterward. No coating with glue is required on the paint. A small quantity of flour paste must then be applied to the surface prepared in this manner by means of a piece of muslin. The stuff should be applied dry, and smoothed with an equally dry brush. When these operations are completed the veneer is moistened with the water, to which glycerine in the proportion of one to sixteen parts is added, in order to soften the wood and give it a great suppleness when once dried. As soon as the wood has swollen uniformly enough it may be cut out in different sizes as required. The surface about to be veneered is then coated with glue, and the veneer then placed in proper order. They are then slightly pressed in order to expel the air. A piece of pine or cork wood may be used for that purpose. All the joint parts must be juxtaposed and not allowed to overlap, and all the paste must be carefully wiped off. As soon as the wood is dry all the stains that may have been made in these manipulations should be removed by washing with a weak solution of oxalic acid in water (one teaspoonful of acid in 1½ pints of water).

**THE PROBLEM OF THE BOOMERANG.**—An exhibition of boomerang-throwing was recently given by a party of Australian natives at Munster before some German scientific men who are endeavoring to discover the cause of the boomerang's curious flight. The instruments were of two sizes, the larger being a slender orecient about two feet long, 2½ inches wide and one-fourth inch thick, made of an ex-

ceptionally heavy Australian ironwood. This boomerang was jerked up into the air about a hundred yards, when it flew straight away, then turned to the left and returned in a curved line back to the thrower, whirling around constantly and whizzing unpleasantly. One badly directed projectile passed through a spectator's hat with a cut as clean as that of a razor. We have not heard what conclusions the German scientists have come to, or whether they have satisfactorily solved the problem; but, according to a German manufacturer, who has made some 11,000 toy boomerangs, the mystery of the movement lies in the shape, the boomerang having a sharper curvature in the middle, with unequal length of the two arms, which must be made of equal weight by unequal thickness. The peculiarity of motion is said to be due to the difference in the length of the arms, which diverges the curve of rotation from the circular.

**A ZINC CEMENT.**—Oxychloride of zinc cement or mastic is prepared by mixing one part of the finest pulverized glass with three parts of oxide of zinc thoroughly calcined (made from the carbonate), which is afterward kept in well-stoppered glass vials. Separately one part of borax is dissolved in the smallest possible quantity of water, it is mixed with a solution of chloride of zinc of 15-1.6 sp. gr., and is kept in this state in well-closed vials. To use this mastic, enough of the powder is mixed with some of the liquid to form a putty, which hardens readily until like stone. Under the name of "Paris dental cement" a similar preparation is sold in the pharmacies which has even been used for filling hollow teeth. This composition can serve excellently for many other purposes; for example, to attach to each other different parts of technical, scientific or domestic appliances, where a tenacious, quickly hardening cement is required. —*L'Electricite*.

**LAND IN CHINA.**—Land in China is divided into more holdings than any other land in the world. It takes but a very small piece of land to support a Chinese family. The Chinese are the closest and most thorough cultivators in the world. Field hands in China are paid \$12 per annum. The food is cooked by the employer. With his food he is furnished straw, shoes and free shaving—the last a matter which a Chinaman never neglects for any great length of time where it is possible to secure the luxury. It costs about \$4 a year to clothe a Chinaman. Much of the land in China is divided up into gardens of areas as small as one-sixth of an acre.

**A POWDER FOR THE FEET.**—A powder is used in the German army for chafing the shoes and stockings of the foot soldiers. It is called "Fusel-pulver," and consists of three parts salicylic acid, ten parts starch, and 87 parts pulverized soapstone (Speckstein). It keeps the feet dry, prevents chafing and rapidly heals sore spots. It is to be recommended to mountaineers.

## GOOD HEALTH.

## The Pain of Freezing.

A party of Minnesota people during the recent extreme cold weather in that region started out on an expedition for hauling logs. Just before dark the party arrived at the place where their work was to be done, and after making themselves comfortable, as stated by one of the party, with a good supper and a blazing log fire, all four lay down to sleep on a bed made on the snow, with a thin layer of hay on top of some boards, and were well wrapped up in blankets. During the night the temperature changed to a terrible cold, the thermometer falling to 45 degrees below zero, as we learned afterward. Had we known this and kept our fire burning, there would, of course, have been no danger; but, being very comfortable, we all fell asleep early in the night and were unconscious of the danger we were in until awakened by the pain of intense cold, and then we were already so overcome with the cold that we lacked power or energy to get up or even to move.

Comparing notes afterward, we found that all had experienced a like sensation, namely—first, an acute pain, like the point of a needle in every pore, but free from all mental anxiety, except a dull conception of something wrong and a desire to get up, but without sufficient energy to do so. This feeling, however, did not last long, and subsided gradually into one of quiet rest and satisfaction until consciousness ceased altogether, and without any struggle or pain, either bodily or mental. We had all reached that stage, when, by an accident, the arm and bare hand of one of the party, who lay on the outside, fell in the snow. This started the circulation in his body, and gave him such intense pain that he quickly aroused himself and got on his feet, and of course we were all saved. It took a long time before we could use our limbs sufficiently to rebuild the fire, and during that time we suffered much more pain than we had before. I am satisfied from that experience that a person perishing in that way has a very easy death, because he sinks gradually into a stupor, which blunts his sensibility both to physical pain and mental agony long before life becomes extinct.

It was about 50 degrees in the morning when we got up. We did not lie down again or at-

tempt to haul out building logs, but started in a few hours on a bye line for a ravine that would lead us back to Red Wing. It was a struggle of life and death to get across the rolling prairie, and had the cold been accompanied by a blizzard, we could not have gone across.

**PRESERVING BEAUTY.**—Some odd-minded investigator, who has spent a deal of patient labor in the search for means whereby women may preserve their beauty, has made an important discovery relating to one whom he calls the handsomest woman he ever knew. She was over 30 years of age when our savant first made acquaintance with her, but, as he asserts with much emphasis, no girl of 16 ever had rosier cheeks or brighter eyes. He made haste to learn her inestimable secret, and here is a summary of his report: She was naturally a fine-looking woman, but the attention which she gave to matters of hygiene enhanced and preserved her physical attractiveness. What did she do? Well, among other practices, she took a sponge-bath every morning; was particularly about the ventilation of her apartments, particularly her sleeping-room; took long walks whenever she could; ate little meat and much fruit and cereal food, and drank her coffee without sugar and cream. To preserve the suppleness of her figure, she practiced standing one hour every day, 15 minutes at a time, with her hands on her hips before a long mirror. In that position she bends the knees outward and sinks slowly to the floor, or as near it as possible, meanwhile moving her arms in any direction to the utmost length, out or up, forward or backward, until she resumes the erect position with hands on hips. Each movement is repeated, accelerating the speed a little until, at the end of 13 minutes, it is done very rapidly, and a fine color is in her face. She then lies down on a flat couch without a pillow and rests until her breath becomes normal and regular, as it will in the two minutes left of her 15. It is easy to see that her whole body thus receives good exercise, which adds to the grace of her form, beautifies her complexion by cunning nature's own means and makes her strong and healthy.

**EFFECT OF DUST ON HEALTH.**—The injurious effects of certain industries upon the health of employes, arising from the dust involved, are especially felt, according to a report made to the British Parliament on the subject, by corn-millers, meltsters, tea-handlers, coffee-roasters, snuff-makers, paper-makers, flock-dressers, feather dressers, shoddy-grinders, weavers of coverlets, dressers of hair, hatters in certain departments, dressers of colored leather, workers in flax, dressers of hemp, some workers in wool, ware-grinders, masons, iron miners, lead miners, grinders of metals, file-cutters, machine-makers, makers of firearms and button-makers. To these may be added colliers, who suffer from lung diseases in ill-ventilated mines; potters, especially the class called flat-pressers, in whom emphysema is so common that it is known as the potters' asthma; the china-courers, who all, sooner or later, become asthmatical from inhaling the light film dust in suspension; pearl button makers and pin-pointers, who suffer from bronchitis and hæmoptoe; the makers of grindstones, Portland cement, etc. How the white-lead industry came to be omitted from the list is inexplicable. —*Ex.*

**OVERWORKED RAILWAY MEN.**—As a result of recent accidents which it was clearly demonstrated were caused partly if not wholly by overwork and excessive hours of labor of engineers, it has been ordered that no enginemen of the Great Northern Railway, England, shall be allowed to go on duty without having had an interval of at least nine hours' rest. This is a wise provision and one that should be generally enforced, not only for the good of the men, but for the safety of the traveling public as well. Movements in the same direction are also being made in several States of the Union. The overworking of street car conductors and drivers is fraught with much danger—especially on cable-car and dummy lines.

**COMPARATIVE CONSUMPTION OF TOBACCO.**—M. Paul Leroy-Beaulieu gives figures showing the quantity of tobacco consumed in the different countries of Europe. The rate per 100 inhabitants is, according to him, as follows: Spain, 110 pounds; Italy, 128 pounds; Great Britain, 138 pounds; Russia, 182 pounds; Denmark, 224 pounds; Norway, 229 pounds; Austria, 273 pounds.

**CAN A MAN COUGH HIMSELF TO PIECES?**—A London coroner has raised the question whether a man can cough himself to pieces. A broken rib was found in a deceased lunatic, when medical evidence was brought forward to show that under certain abnormal conditions bones may be broken by muscular efforts or even by a violent fit of coughing.

**ELECTRICAL MEDICATION.**—According to the *Electrical Review*, medicine may be introduced into the human system by electricity. The electrodes of a battery are saturated with the medicine and applied locally to the skin. Experiments show that there is an actual absorption of the medicine into the system.

**ABDOMINAL MASSAGE** has been successfully applied by Dr. H. Sabli, of Berne, to the cure of constipation. His patients are recommended to roll a five-pound cannon-ball over the abdomen for five or ten minutes daily.

## The Lumber Business of the Pacific Coast.

The lumber business of the Pacific Coast has already developed into magnificent proportions, and is still growing at an annealingly increasing rate which bids fair, at no distant day, to constitute the largest local interest of the kind on the entire continent. It seems to have taken a new start during the past few years.

The census of 1880 gave, in round numbers, 693,000,000 feet as the cut of that year on the Pacific Coast. Of this amount California contributed 305,000,000 feet, Oregon 177,000,000, Washington Territory 160,000,000; the balance, 51,000,000 feet, was contributed by Idaho, Nevada and Arizona—the last-named furnishing nearly 11,000,000 feet.

Since 1880 Washington Territory, in which is located the great lumber region of Puget sound, from being the third on the list has made a wonderful development and leads by far all other localities. We append a rough estimate as the figures for 1887:

	Feet.
Washington Territory.....	600,000,000
Oregon.....	300,000,000
California.....	400,000,000
All others.....	70,000,000
Total.....	1,370,000,000

These figures show a wonderful increase in the lumber business of this coast during the first seven years of the present decade, the yield having practically doubled in that time.

About one half of the total lumber produced of the coast has long been consumed in California, and the present boom in Southern California has largely increased the consumption during the past year. It is estimated that about one-half the entire lumber used in the State during the last half of 1887 was consumed in the three southern counties. As there is every reason to believe that the great influx of newcomers into the State will continue in an increased ratio for several years to come, we may look for a corresponding increase in the lumber business. People that are coming here must have homes, and our lumber-mills will be taxed to their utmost to keep up the supply. To do this the capacity of existing mills must be largely increased and many new mills must be built. The increase of production during the last year has been about 200,000,000, or a little over 17 per cent. As the influx of people coming to stay is now spreading over the entire State and the numbers greatly increasing, we may reasonably look for a lumber famine for a year or two to come. Either this or our foreign trade must suffer. This last would be a misfortune, as our foreign and Eastern lumber trade promises to be one of the great trades of the future, and one which we ought to nourish with great care. The mills now in operation will be utterly unable to supply the demand, and in all probability it will be impossible to put in operation new mills sufficient to turn out a supply sufficient to meet the urgent necessities of our rapidly growing population. It is a fortunate fact, however, that

## Our Forest Supplies

Are equal to the most urgent demand which can be made upon them. We have, first, immense lumber regions, which may be opened up all along the western slope of the Sierras and Rocky mountains by lateral railroads, which may be easily rushed up into their canyons from main lines at innumerable points. These mountain trends along the Pacific Slope from the northern to almost the extreme southern boundary lines of the Union—a distance of some 2000 miles, and are covered for nearly their whole extent by immense forests of the finest timber on the continent. Then we have the Coast Range with even a much larger supply. The average width of this latter range cannot be less than 25 miles by a length of about 2000. Passing on northward and beyond British Columbia, we have in Southern Alaska another forest stretch of absolutely unknown area, probably nearly or fully equaling the two areas already noticed. All this timber is readily approachable by ship or rail, and will all be eventually converted into serviceable values. It has been estimated that when all the available timber in the regions south of British Columbia is converted into merchantable lumber, its market value cannot be less than \$20,000,000,000 or \$25,000,000,000, when placed at tidewater. There is no doubt but that amount of money will be realized from it in the near future by those engaged in the industry. It is almost impossible for the mind to comprehend such immense values. The amount named is fully two-thirds of the assessed valuation of all the property in the United States at the present day. The *San Francisco Journal of Commerce*, in alluding to the magnitude of the forests of the Pacific Slope, says: The principal descriptions of lumber that go to make this up are the pine or red fir, the redwood, the cedar, and the sugar-pine. The pine or red fir is found west of the Cascade range, between 44 and 52 north latitude, 8° or 560 miles in length. All the country round the basin of Puget sound, except in the few clearings, is covered with its steadily growth. The redwood is king from 37 to 42 north latitude, and takes in 4125 square miles. Great tracts are covered with trees 200 to 300 feet in height, and a redwood forest is one of the most majestic sights in the world. The cedar is found wedged in between the redwood and the sea from 40° to 42°. The sugar-pine is the most valuable timber found in the Sierras, and is present in almost inexhaustible quantity.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

### CALIFORNIA.

#### Amador.

**PROSPECTING.**—Amador *Ledger*, March 3: Two brothers, Chris and Eric Emsley, have been prospecting in the vicinity of West Point bridge, on the Amador side of the river, for the past few months. They have run a tunnel on a claim adjoining the Tirakoff mine, a distance of 40 feet, and have within the past few days struck a vein 14 inches wide of exceedingly rich ore. It shows free gold all over it, and prospects over \$100 to the ton. Col. Robinson had a large lot of milling machinery hauled to the Calaveras bank of the Mokelumne river opposite the Cleveland mine, for transportation across the river, to be erected on the Cleveland. The milling plant was purchased in Calaveras, and it was considered the easiest method to get it to the mine to haul it across by raft. The mine is very difficult of access by wagon. The Bunker Hill mill is in part supplied with ore from the ledge struck on the Mayflower ground, between the mill and Bunker Hill shaft. The rock is said to be of excellent quality. The extent of the ledge is not yet known, but it is thought likely that this discovery will place the Bunker Hill Co. on a solid basis of prosperity. The ledge is reported by mining men to look better than any discovered on this property for years.

**ZEILE.**—Amador *Dispatch*, March 3: We understand that the Zeile Mining Co. are considering the matter of sinking a new perpendicular shaft 1000 feet deep, east of the present main shaft; and it is thought by some that Supt. Detert's present visit to San Francisco is, in part, to consult with the principal members of the company upon the proposition. A step of this kind would no doubt be a judicious one, as it is said there is an immense body of ore at the bottom of the present works, about 900 feet, and of a somewhat better grade than that above. Of course the undertaking would be expensive, but would be much easier kept in good condition than the incline shaft now in use, the timbers of which have to be frequently replaced owing to the great heaviness of the ground.

#### El Dorado.

**TAYLOR.**—Georgetown *Gazette*, March 3: The Taylor mine is running on a limited force; the lower levels have a fine ore body of more than 300 feet exposed. The stamps of the new mill are dropping on fine rock, with highly satisfactory results. New self-feeders to the mill and additional machinery has been added to the mine. Mr. Chester, who is one of the principal owners, is giving his personal attention to the working of the property.

**GRIZZLY FLAT.**—Cor. Placerine *Observer*, March 1: Our town is dull when in fact it ought to be one of the liveliest camps in the county. We have a great many and a variety of quartz ledges large and small, all of which, or nearly all, are at present non-producers, simply for the want of proper process for working the ores. At and near the surface, varying in depth according to elevation, the ores were all desulphurized by action of the elements and paid well by common mill process. But at water-level, while the ledges continue down in size and are well defined, the ore becomes a sulphid and rebellious, and the gold cannot be saved by the wet battery and galvanized copper plates. I will mention in this connection the Stillwagon mine which paid its original owners largely until they reached water level and consequently rebellious ores. While the ore would give an assay value on an average of \$65 per ton, not more than \$6.50 could be saved by common mill process. Then why not change the process? Put up a furnace with capacity of one ton per day. Crush the ore dry, roast, chlorinize, or use pans or any other process by which the gold can be taken out after the ore is roasted, and take as much bullion out of one ton of ore as they now do out of ten tons. This would not only be a great saving of the mine, but in expense. For instance, the difference between the cost of taking out one ton of ore and ten tons. The cost of mining, crushing dry, roasting and chlorinizing on the ground would not exceed \$25 per ton, giving a net product of \$45 per day from one ton of ore. There are many such mines hereabouts. I could name them by the dozen that would pay fortunes by the proper process of working. When men represent these rich sulphid ore mines to inexperienced capitalists as large free-milling ore propositions, they are doing themselves and the country an injustice. At the same time there are fortunes in this class of mines.

#### Nevada.

**AN OLD MINE RELOCATED.**—Grass Valley *Tidings*, March 1: The old Pittsburg claim, situated at Deadman's Flat and adjoining the Eastern Star mine on the south, has been relocated by P. H. Paynter, T. H. Wilhelm, C. E. Clinch and Wm. Larimer of this city. An extension of the Pittsburg has also been located by these persons. There is a shaft almost perpendicular, 150 feet in depth on the Pittsburg, sunk by McCook Bros. & Co. many years since. Between \$40,000 and \$50,000 were taken from the mine in gold while it was operated. A long and costly lawsuit, followed by other embarrassments, resulted in the abandonment of the property. A small force of men are now cleaning out the old shaft; this done, development work will follow.

**GOOD CLEANUP FROM THE BANNER.**—Nevada *Transcript*, March 3: A crushing of 22 tons of ore from the Banner has just been made and the average yield was \$22 a ton, which is about the amount the ore paid when the old mine was in its early-day glory before the pay chute was lost. This ore came from the vicinity of the former workings, there having been discovered in the footwall an eight-foot ledge of solid quartz that was not seen by the original owners. A crosscut is being run to tap the new ledge quite a distance beyond where the crushing has been extracted, and if the formation holds its present thickness and quality to the point where the crosscut should reach it, the Banner will again become one of the leading bullion-producers of the country.

**WASHINGTON TOWNSHIP.**—Cor. Nevada *Transcript*, March 3: Some very rich rock is now being taken out of the Bluebell mine. The ledge is 8 feet in width, and as greater depth is reached the rock

grows better. A rock-breaker is soon to be put in place at the mine, which will greatly facilitate the banding of the ore. Ten or 15 more stamps will be added to the mill in the near future. The Bluebell mine as far as developed proves to be one of the most favorable prospects in this district. It is now more than likely that in a very short period of time the celebrated Eagle Bird mine will again be put in operation. Al. McKee is engaged in prospecting a ledge further east which shows some fine-looking quartz. The old stand-by, the Yuba mine, never showed up so well as at the present time. On the 500-foot level the ledge is from 10 to 11 feet in width, and in many places it is very rich in free gold and sulphurets. The 25 stamps are kept hammering away night and day without cessation. The result is a steady stream of gold. Heretofore the pay chute in the mine was supposed to be pitching south, but later explorations developed the fact that the rich lead that they now are following up pitches north, which is considered much more favorable for the permanency of the mine. Ole Helgeson, Chris Anderson and Martin Vandenberg are now engaged in erecting a small four-stamp mill, for prospecting purposes, on the Daylight quartz mine, situated on Holbrook Flat a short distance below the Yuba mine. Their material is now all on the ground and it will not be a very long time before the company will be ready for business. Their ledge is from two to four feet in width and the rock prospects rich in free gold. The Golden Gate, better known here as the Rodda ledge, has recently been relocated by other parties, and hereafter it will be known as the Ormonde quartz ledge. The Washington mine is looking exceedingly favorable in all its departments. At the 100-foot level the drift south is now in a distance of nearly 800 feet. The ledge in places is 14 feet in width and some of the rock shows very rich in free gold. At the 200-foot level drifts have been run a short distance on the ledge both north and south, uncovering a good-looking body of ore eight feet in width. The 20-stamp mill is kept steadily running night and day without intermission. It is only a question of time, and a short time too, as to when the Washington mining district will prove to be the greatest gold bullion-producer of the State.

#### Placer.

**OPHIR.**—Placer *Herald*, March 3: At present there is but little work doing on the ledges. Messrs. Shurtliff and Robinson, after an interval of inaction of several months, owing to lack of water-power, have begun work. The water has been pumped out of their shaft in the Doig mine, and the present indications of rich pay rock are very flattering. Last season according to report they took out \$60,000 from this mine. Kidd and Johnson, owners of the Pioneer quartz-mill, are operating their mine but have not had the time or the water yet to prospect it. They have refitted the mill and are doing custom work and expect to run the year round. Nothing is doing on the Bowlder mine. The Butts mill is idle just now. Mr. Pelster's mill is running on good rock taken from the Rock Creek mine.

#### Plumas.

**GRANITE BASIN.**—Plumas *National*, March 3: Joseph Peppin of Granite Basin says the Basin is in a flourishing condition. He worked three tons of rock last week for Mr. Christie, from the Christie ledge, which paid \$400, and said Christie panned \$150 out of the rock. It would have paid \$150 per ton before the richest of the rock had been selected and worked. Swan & Co. have not started their mill yet, but will in a short time. W. C. Graves has a four-stamp mill on his claim, which will be put in running order as soon as the snow disappears. See & Jolly have plenty of good rock and will start their mill as soon as the weather moderates. John Chatty is running an arastra on his claim in the upper end of the Basin.

#### Shasta.

**IGO.**—Cor. Shasta *Courier*, March 3: Robinson & Son have found a chimney of good ore on the surface, about 500 feet north of their Black Prince shaft. Jake Blank is running his arastra on N. Manzanita ore, and ore taken from a ledge at the head of Bogus gulch. J. P. Wright's shipment of sulphurets was satisfactory. He is running a lower tunnel, and retrimbering the upper works. Shirland Bros. are taking out good ore at the Pacific and crushing the same in their arastra. E. L. Ballou's arastra is running on Hope and Manzanita ore. C. J. Russell is at work on his Centennial. Shaw & Bennett have got the Continental mill crushing ore from the Continental mine. A Shaw concentrator is to be used for concentrating. The sulphurets are to be shipped, for the present at least. C. Godfrey has been taking some good ore from the N. Hope. The Dayton is looking first-rate. The tunnel is being continued past the shaft. Rothwell is doing some work on his Confidence. P. Gibney talks of tapping his Grand Central from the Kanaka side. Wm. Lee is at work on a ledge north of the Grease Wood. Some placer mining is being done, generally with small returns.

**CHROME.**—*Courier*, March 3: It is not generally known that in Shasta county exists one of the best chrome mines in the world, but such is a fact. It is located at Shotgun creek, on the Sacramento river, on the line of the California & Oregon railroad, and not far from Sims station. The body of the material, so far as developed, shows a width of exposure of many feet, and the length of the lead is known to be great. The depth of the deposit has not been ascertained on account of having to contend with water after a certain depth has been reached, and no machinery or means of dispensing with the water have been erected, not being needed at present, as there are millions of tons of chrome above the water line. Mr. Jones, one of the owners, was in town Tuesday, and informs us that shipments of the chrome have been and are being made to the chrome works at Baltimore and Philadelphia, and the material pronounced the best yet sent to those works. The railroad company has put in a side-track and platform for the accommodation of the shippers, who have named the sidestation Chromite.

#### Sierra.

**PILGRIM.**—Mountain *Messenger*, March 3: The Pilgrim G. M. Co. will soon, if report be true, make arrangements for operating their mine early in the spring. Several more men have been put to work at Little Grizzly, 14 now getting out gravel.

#### Siskiyou.

**KLAMATH MILL.**—Cor. Yreka *Union*, March 3: Everything in shape of mining in this part of the

country is lively now. The gulches are all running full of water and along with the fine weather we are having it makes the river and quartz mining boom. A rich strike is reported in the Black Bear mine, which from all accounts is like the rich strikes made in years gone by, which goes to prove that the Black Bear is yet one of the leading mines of the State. The mill is running right along with plenty of good ore in the dump and also up at the mine. Mr. Bradley, who has charge of the Mountain Laurel mine, which is owned by A. Ball & Co. of Canton, Ohio, informs your correspondent that the mine is turning out well considering the amount of work done on the ledge direct. Yet there has been enough done to satisfy the company that the mine is a valuable one. They are running about 12 tons of ore per day at present and expect to double the amount soon. The mill under the management of Mr. Corbett has been running night and day, and after a month's run was closed down for a few days to clean up and alter one of the batteries. They will start up again the 26th. The result of the above cleanup was very satisfactory to the owners, the average of the rock milling far above that which was crushed last year by its former owners. Messrs. Bures & York of San Francisco are driving a crosscut tunnel on the Indian mine which is situated on Methodist creek. They expect to strike the ledge 100 feet deep, and from surface indications we may expect to hear of a big strike soon. The mines on Know Nothing creek are all at work, and well might they be, for it is seldom that such flattering prospects present themselves to the faithful miners as has been the case in that camp. In the past year the mines have opened up better than was expected, the result of which was the building of an eight-stamp mill by Mr. Raddelinger and a number of arastras by other mine-owners for the purpose of extracting their bullion from the rock. There is no doubt about this section of the country being one of the best mining sections in Northern California, which could be easily proven if there was a wagon-road built through from Rough and Ready to the Salmon river.

#### Trinity.

**COX'S BAR.**—Trinity *Journal*, March 3: All the placer miners are at work, but complain that the water supply is diminishing rapidly. Mr. Jas. Wallace, in the Willshire mine, is working good gravel, and with spring rains will do a good season's work. Two partial cleanups have been very satisfactory.

**EAST FORK.**—The miners on East Fork are busily at work making up for the time lost during the cold spell in January. Day & Moor are crushing ore from the Ozark. John and J. W. Bergin are running rock from the Thaksgiving mine through their arastra. The owners of the Enterprise are running tunnels and taking out rock from the ledge. They are also running a tunnel to prospect the Lone Jack; their arastra is not running, as high water injured their dam; the damage will be repaired soon. In the Golden Chest men are at work running tunnels and taking out ore. The ore is very good, carrying both free gold and sulphurets; the ledge is about 16 inches wide. The Simmons Bros. are taking good ore out of their ledge the Webfoot. The owners of the Hardscrabble have sunk a shaft to the depth of 50 feet and find the ledge growing richer with depth attained. The vein at the bottom of the shaft is six inches wide and carries extremely rich sulphurets. The ore resembles that of the Idaho mine in Grass Valley. Smith, Waters & Hubbard are working their placer mine on East Fork and are doing very well for the amount of water they have.

#### Tuolumne.

**HOMESTAKE.**—Tuolumne *Independent*, March 3: The Homestake mine at Yankee Hill, owned by Messrs. McKenna, Hale & Hastings, and leased by Mr. John Engstrom, has recently panned out another pocket, amounting to several hundred dollars. This mine was located eight years since, by Mr. W. F. McKenna, who has staid by it through thick and thin ever since. A couple of years ago, Messrs. Hale & Hastings became interested in it and prosecuted the work upon it vigorously, but without reward. For three years the labor was expended in vain. Success has at last crowned their efforts, and the Homestake promises to reward well the pluck and enterprise of its owners.

**LOOKS WELL.**—The experimental gulch mine looks well. The mill works perfectly, and hammers away without cessation, from one week's end to the other. The prospects for a good cleanup are very encouraging.

**MILL RUNNING.**—The Black Oak quartz mine near Soulsville is looking splendidly. At a depth of 200 feet the vein is from four to five feet wide, and very rich. The ore comes up black; it is full of sulphurets, the assay of which is no cause for grief. The mill is running night and day.

**POCKET.**—It is rumored that last week Mr. Jim Gillis emptied a pocket at his mine on Jackass hill, near Tuttle town, which contained the neat little amount of 20 pounds of gold-dust. Mr. Hank Gale of Sawmill Flat took out a nice little pocket of about \$300 in his claim on Friday of last week, and has been doing well ever since. Report has it that Dave McDonald of Tuttle town has been doing some good work in his mine on Jackass hill, and one day last week unearthed the shining metal to the tune of 15 pounds of gold. Tuttle town has many good mines that only await development to yield a golden harvest.

#### NEVADA.

##### Washoe District.

**CROWN POINT.**—Virginia *Enterprise*, March 3: No. 1 east crosscut has been advanced 20 feet during the week; total length, 73 feet; No. 2 crosscut east is in 95 feet. Both are in favorable vein matter. A crosscut has been started on the south line. It is in 24 feet in soft porphyry and clay, and shows a small flow of water. The 600 drift is now out 280 feet.

**HALE AND NORCROSS.**—Since the last report the south drift on the 400 level has been advanced 40 feet, and the north drift 45 feet. The east crosscut from the south drift has been advanced 35 feet in quartz, 12 feet of which is in fair-grade ore. The west crosscut has been advanced 29 feet in quartz, and has reached the west clay of the vein. In the north drift, 100 feet north from the main west drift, have started west crosscut No. 2 and advanced it 50 feet in favorable vein material. On the 700 drift northwest from the top of the north upraise has been

connected with the south drift from the Savage 600 level. These drifts show the continuation of the 700 level ore body 125 feet north from the north upraise. The south upraise has been extended 20 feet, being now 108 feet above the track floor. Have started a drift north from the top of this upraise, and advanced it 27 feet. It continues in fine ore. Are shipping the usual quantity and quality of ore to the Vivian mill, which is about 40 tons per day. Bullion on hand, \$27,000.

**SAVAGE.**—Since last report the south drift on the 400 level has been advanced 74 feet and connected with the south drift from the 500-level upraise. This connection has greatly improved the ventilation of the mine and facilitates the extraction of ore from this level. Are extracting from the several levels between the 400 and 900 about 140 tons of ore daily, which is being reduced at the Mexican mill. The car samples average \$33 per ton. Bullion on hand and previously shipped for this month about \$50,000.

**BEST AND BELCHER.**—The main north drift has been extended 44 feet; total, 569. The formation is quartz, giving low assay values. The west crosscut from the top of the upraise has been advanced 33 feet, and cut into west clay. From this west crosscut, near the upraise, the north drift has been advanced 11 feet. The formation is wholly quartz showing some value. Opposite the north drift a south drift has been advanced 13 feet. The face is in quartz showing value.

**OCCIDENTAL.**—In the upper tunnel No. 1 upraise, 35 feet above the tunnel, the south drift has been extended 15 feet; total, 30 feet. On the 100 level, in No. 2 upraise, 50 feet below this level, are cutting out a station. Sixty-five feet below the 200 level the north drift has been extended 5 feet; total, 20 feet. Have extracted 45 tons of fair-milling ore during the week.

**BELCHER.**—The 500 east crosscut is now in 95 feet, having advanced 25 feet during the week. Have temporarily stopped the 400 south drift, and started a crosscut west on the 500 level on the Belcher and Crown Point line. Both the east and west crosscuts are in favorable-looking vein material. The Sutor drift is out 1300 feet.

**GOULD AND CURRY.**—On the 250 and 300 levels have extracted during the week 120 tons of fair-grade milling ore, which is stored in drifts in the mine. On the 1300 level the south drift from the east drift has been extended 41 feet; total, 377 feet. The formation is porphyry showing some value.

**UTAH.**—East crosscut No. 3, opposite west crosscut No. 2, has been extended 51 feet; total, 64 feet. This crosscut has passed through four feet of quartz and the east clay wall. The face is in east country rock and free from water. From this point will start an upraise and later drift west through the vein.

**CHOLLAR AND POTOSI.**—Prospecting work is being vigorously pushed on the several levels of both mines above the 550 level. The ore reserves are yielding steadily and the mill is running splendidly. Progress is reported in the several drifts, without any particular change to note.

**BALTIMORE.**—The developments on the 380 level are not yet sufficient to demonstrate the extent and value of the ore recently struck at that point. The machinery is working well and handles the water readily. Work progresses actively.

**ALTA.**—Are sinking a new shaft, 250 feet east of Keystone shaft, on the Keystone vein, to meet an upraise from the 825 level. This will greatly facilitate the handling of ore and prospecting the mine at that point when completed.

**YELLOW JACKET.**—Shipping 175 tons daily to the Brunswick. It is extracted from the 1200, 1300 and 1400 levels. The machinery is all working well.

**ALPHA, IMPERIAL AND EXCHEQUER.**—Progress only is reported from the drifts on the 300. There is no change of interest in the formation.

**BULLION.**—Are cleaning out drifts on the 500 level. The east drift has been cleaned 150 feet and the west drift 20 feet.

**SCORPION.**—On the 300 level the north drift is advanced 128 feet, and the south drift 105 feet. Both are in vein material.

**ANDES.**—The usual progress is reported in the prospecting drifts on the two upper levels of the mine.

**SEGREGATED BELCHER.**—The south drift is in 194 feet, having advanced 23 feet during the week.

**WEST CON. CAL.-VA.**—Are still sinking the shaft. There is no change to report in the work.

#### Eureka District.

**ORE SHIPMENTS.**—Eureka *Sentinel*, March 3: During the past week ore shipments were made from the mines of the district as follows: To the Eureka Co.—Dunderberg mine, 29 tons; Oriental and Belmont, 13 tons; Margueretta, 8 tons; Silver Lick, 17 tons; Massachusetts, 2 tons; Bowman, 7 tons. Richmond Co.—Jackson, 33 tons; Bullwhacker, 5 tons. The outside men at the Eureka Co. slag dump were discharged last Wednesday morning, but will again resume work after the reduction works have been overhauled.

#### Hawthorne District.

**THE PAMILCO.**—Esmeralda *Nevada*, March 3: The Pamlico mine is another of the accidental discoveries of Hawthorne district. In July, 1885, S. A. Knapp, Jr., found a piece of float rock rich in gold, on what is now known as the Pamlico ground, and taking it as a sure index of a valuable mine, made the location. In the fall of that year some prospecting work was done, which resulted in such encouraging indications that the work was continued in a small way during the spring of 1886, when a crushing of ore was made giving a product beyond expectation. Out of the first batch of ore worked \$1500 was produced, which amply paid for the labor and other expenditures. In 1887 the mine was let out to tributers who continued the work of prospecting, developing and extracting ore from the mine. Several of the miners and prospectors have made "handsome stakes" on their leases of this claim. It has become the attraction of the district and many old miners are amazed at its productions. On the easterly line of the claim there was an area of about a quarter of an acre of soil, which varied in depth from one to seven feet, diffused with gold from which many tons were gathered, screened and worked, netting immensely. At present the owners,

Messrs. Knapp, Laws, Forbes, Tobey, Yerington, Jr., and D. L. Bliss, have a small force of men at work on the mine who are extracting the rich ore, 15 tons of which was worked at the Kindred mill. The returns were received last Saturday amounting to \$6344. The mine is being worked in three places—the north tunnel, middle incline and south tunnel; the course of the ledge is north and south, dipping east. On the surface of the claim there are 3 stringers, which in their course downward come together, making a ledge of varied width from one to four feet. From the middle incline, drifts are run southerly in which there is a 12-inch vein of rich ore, and if it continues with its present richness by the end of this month there will be several thousand dollars produced by the labor of a very few men. The north and south end tunnels are run on the easterly stringer from which the other more westerly veins are crosscutted; the developments therein are flattering. Though but few men have been worked on the claim, there is already a systematic method employed in its development. The ledge is proved by exploration to maintain its strength and continuity in depth and extent, and has free gold disseminated through the quartz which can be seen with the unaided eye. There is considerable rich ore now on the dump, while the stopes, crosscuts and levels show up like a jeweler's window.

#### Seligman District.

**THE CONCENTRATOR.**—Eureka Sentinel, March 3: The concentrator building is looming up grandly, being entirely finished on the outside. The balance of the machinery is arriving and is being set up as rapidly as the mechanics and helpers can do the work. The mechanics, miners and laborers at the Seligman mill and mines have been comfortably lodged during the winter in log buildings erected for that purpose. Ninety men are employed by Eugene N. Robinson at Seligman. Work is being diligently prosecuted in the Purcell series of mines, and 30 extra miners will be put on, but none who are not thoroughly experienced will be employed. The ore in the mines is improving in quality in a number of different places, as shown by 30 or 40 samples taken daily from the various openings for trial assays. From 15 to 20 tons of concentrates per day will be turned out from the mill at Seligman when it will be in operation. It is estimated that the value of these concentrates will contain about 70 per cent lead, 65 ounces silver, besides the gold and considerable iron.

#### Tuscarora District.

**NAVAJO QUEEN.**—Times-Review, March 2: Have finished sinking sump and commenced crosscutting for ledge.

**PONDERE.**—Have suspended work in the crosscut and have commenced drifting both north and south on Ledge No. 2. Ledges in drifts are looking favorable.

**BELLE ISLE.**—East crosscut, 250-foot level, has been extended a total distance of 145 feet. A drift has been started north on a vein crosscut a short distance back from the end of the crosscut.

**FOUND TREASURE.**—Stope from No. 1 chute continues to yield usual amount of good ore. Commenced shipping ore to reduction works yesterday. Will ship only enough to pay running expenses till roads improve.

**NAVAJO.**—There is no material change in any of the workings.

**NEYADA QUEEN.**—On the 350-foot level, west crosscut has been advanced 11 feet. Several seams of spar have been encountered. North drift, same level, on the east vein, has been advanced 29 feet. The face of the drift is now looking better than for the past few days, and the flow of water is increasing as we go north.

**NORTH BELLE ISLE.**—North lateral gangway, 400-foot level, has been extended 20 feet. The formation looks favorable. The flow of water is stronger. Line crosscut, 300-foot level, has been extended east 82 feet. The face of the crosscut is now in vein matter assaying between \$25 and \$50. Have started to open the stopes north of No. 3 crosscut on this level. No. 1 upraise on the vein, on the 70-foot level, is developing a good width and grade of ore. Present height 26 feet. West crosscut on this level, to connect with the shaft, has been extended 20 feet. The stopes at all points are yielding the usual grade and quantity of ore.

**GRAND PRIZE.**—Three-hundred-foot level: South crosscut extended 21 feet; total length, 750 feet, and shows no change. Face of west drift advanced 19 feet in low-grade ore; total length, 189 feet. The west crosscut on the 200-foot level extended 27 feet through a porphyry formation, and will be pushed ahead as rapidly as possible to develop the ore body now exposed above the 300-foot level. The extraction of ore was discontinued last Monday owing to there being only a sufficient amount of fuel left to work what ore was broken and in the mill. The stopes were left showing more good ore than at any time previously. The mill will be shut down and cleaned up next week, after which all necessary repairs will be made preparatory to starting up again as soon as fuel can be had.

**COMMONWEALTH.**—On the 100-foot level the west drift has been extended 21 feet, showing good ore. The ore has raised above the top of the drift, and work will be suspended at this point for the present. On the 150-foot level north drift from the station has been extended 12 feet. Upraise from north drift has been extended nine feet. The ore cut in the top of this raise is three feet wide, and same as in the north drift on the 100-foot level; assays show from \$266 to \$800 per ton.

#### ARIZONA.

**COPPER QUEEN.**—Tombstone Epitaph, March 3: The Copper Queen Co. uses 1,000,000 feet of lumber per month in the mine, extracts and smelts 240 tons of ore a day; has 311 men on the pay-roll; distributes \$300,000 per month in wages, and uses 450 cords of wood every 30 days.

**WALLAPAI DISTRICT.**—Cor. Mohave Miner, March 2: Among some of the mines now being worked in this district, we are informed by our correspondent, who has recently taken a trip over the hills, that the prospect in the near future is very bright. Among the many he particularly mentions the Old Keystone mine at Mineral Park, the 63, now known as the 78 mine, the Flores, Vanderbilt, Twins, Champion, Rural, Stark & Ewing, Rural

Extension, known as the Josephine, and several others which have been lying idle for some time.

**THE KEYSTONE MINE** is now producing some of the richest ore ever taken from the mine, at the 150 and 200 foot levels. This claim, if energetically worked, would keep the 10-stamp mill running constantly on \$50 ore. It is, however, leased, and the lessees are only handling high-grade ore—\$150 to \$300 ore.

**THE 78 MINE** is situated near Stockton Hill and was formerly known as the 63 mining claim. Formerly it was one of the best known mines in the county and was a famous ore-producer. Last winter, in November, the property was sold to a San Francisco party, who is now exploiting the mine in first-class style. A shaft has been sunk on the claim below the old workings, which were caved and rendered useless. Mr. T. Edgar is running a drift, which is now in over 60 feet from the main working shaft. The footwall of the ledge has been encountered within the week, and as this drift will be over 100 feet deeper than any of the old shafts, and the main ore chute is distant only 90 feet from the main shaft, ore is expected to be encountered at any moment, when a large force of men will be engaged.

**THE FLORES** property, which has lately been in trouble from an overdose of bosses and superintendents, is about being started up under the management of Mr. Jno. Campbell, a practical mining engineer. The mill, we learn, will be under the management of L. Lassell, Esq. Messrs. Campbell & Lassell are taking down the stamps of the Welton mill at the Park, and will put them up in connection with the Flores machinery, together with the Flue concentrators, when all will be hammering away soon on \$20 gold ore.

**THE VANDERBILT MINE** is now leased by James Twigg and Mr. Campbell, and we are glad to say that the ore now being taken from the Vanderbilt is the finest lot ever yet extracted from the mine. The ore taken out of the Vanderbilt will average \$150 per ton in free gold, and not by any means a "pocket." We have lots of mines here that will turn out \$100 per ton in gold. The Flores, the Eureka, the Vanderbilt, the Oro Plata and the Alpine will do it.

#### COLORADO.

**REDWELL BASIN.**—Elk Mountain Pilot, March 2: Dr. Evans and Charley Huesner have gone up into Redwell Basin to work on a new location made by them recently. It is an old abandoned location that has a 200 or 300 foot tunnel, situated near McGee's old cabin, and the doctor thinks he has very good prospects to get pay mineral in sufficient quantity with a very little work.

**SYLVANITE.**—We learn that W. S. Baker has sent in from Denver \$2000 to pay off the men at the Sylvanite mine.

**CONTRACT.**—We understand Tom Burke has taken a contract on the Pacific mine on Treasury mountain, and will drive the tunnel 50 feet for \$12.50 per foot. The Hanlon Bros. will probably commence work on their Yule creek property the latter part of this month.

**ASPEN.**—Cor. Georgetown Courier, March 1: The great camp of Aspen is attracting a world-wide attention at present. The city is located in one of the most beautiful valleys in the State, and, though like all typical mountain towns the houses are mostly frame, it is one of the neatest and best-looking mountain towns your correspondent has ever seen. But the mines! Here lies the great hidden secret of Aspen's prosperity. Unlike our veins in Clear creek, there seem to be whole mountains of rich mineral here, and, though but few of the great ore bodies are at present actively worked, the output is almost 2000 tons per week. The two railroads are kept busy and another one or two will be in demand when the wonderful belt of rich mineral is opened that is known to exist between here and Ashcroft, nine miles distant. I have met several of the Georgetown and Silver Plume gentlemen who are here, and all seem to be employed; but it is a fact that the number of laborers here at present far exceeds the demand, though at a not distant future I believe there will be work for all who come. The scarcity of work is owing to the fact that many of the properties will not be actively worked until the settlement of litigation. The coming of spring will also see the opening of many new properties, thus giving employment to hundreds of miners.

#### DAKOTA.

**TIN IN THE BLACK HILLS.**—Deadwood Review, March 2: In response to further inquiries Mr. H. W. Fowler, general manager of the Tin Mountain Co., states that the superintendent of the mines at Tin Mountain, in the Black Hills, reports good progress considering the trouble experienced from the freezing of the water and its consequent scarcity. Still, notwithstanding all the drawbacks attending the working of new machinery, they have about 10,000 pounds of concentrates, and hope in the course of a month or six weeks to be able to ship several carloads to the smelting works. Mr. Fowler says they have plenty of high-grade ore at the mill to work on as soon as the weather justifies the superintendent in pushing matters. We would remark incidentally that this is the sole and only tin mine developed and in operation in Dakota. By development and operation we mean the ore actually mined, delivered at the mill and there made into concentrates ready for the smelting furnace. The company of which Mr. Fowler is the head is composed of leading capitalists of Chicago. The stock is not on the market for sale, and the business of development will be pushed on as rapidly as possible.

**TUNNEL.**—Deadwood Pioneer, March 2: The Rochester Co. has started a tunnel near the Old Savage tunnel site, which they intend to tap the shaft now being sunk on their property in Lead. The tunnel will tap the shaft at the depth of about 400 feet. Messrs. Stein, Reid, Wilder, Hoagland and Brittle, the principal stockholders, will back them up, and they intend to have at least 50 men on the pay-roll within a month.

**BUYING CLAIMS.**—Negotiations of the Deadwood Reduction Works for the services of Mr. Clark, to personally superintend erection of works for treatment of Bald mountain ores, and to devote his entire time to management of the company's business, have been altogether successful. Anticipating this conclusion, a few local men of means have recently been quietly acquiring title to a considerable num-

ber of promising claims situated in the district. The methods pursued have been free from ostentation, and therefore the transfers have called for little or no comment. The prospector or claim-owner has received and accepted an offer, and pocketing the purchase price, returned to his lonely cabin without troubling himself to inform the public he had sold out. The purchaser has kept his own counsel, and as no other parties may have been cognizant of the deal, nothing was known of it. A glance at the receiving-book in the register of deeds office will show, however, that transactions of this nature have been many during the last three weeks. The individuals whose names appear as grantees are able to proceed to thorough development of the claims.

#### IDAHO.

**SILVER DISTRICT.**—Idaho World, March 1: Chas. Curtis and Mike Gould arrived here Friday evening from Silver district. Mr. Gould, who is employed in the Julia mine, says they cut through the ledge, which proved to be nine feet wide, and all good ore. He estimates that taking the entire ledge, the ore will mill \$30 per ton, and by assorting will mill \$50. This is good for a ledge of that size. In portions of the vein the silver lies in flakes, and is easily detached from the ore with a knife blade.

**BONANZA HIGHTS MINE.**—Ketchum Keystone, March 2: Another important mining locality, and one which will prove advantageous to Ketchum, is now creating considerable attention, from the fact of a fine rich strike having recently been made in a mine known as the Bonanza Hights. This property is situated on the range of mountains forming the boundary line between Alturas and Custer counties, about four miles north of the Summit house, on the Ketchum and Challis toll-road, and about 2½ miles from the road, and 18 miles north of Ketchum. The owners have been running a tunnel for the last three months to tap the vein, and in running a distance of 100 feet they were successful in cutting the ledge, which was found to be from six to seven feet wide—2½ feet of the vein being good pay ore, and a foot of solid galena assaying from 70 to 200 ounces of silver, half an ounce in gold and from 50 to 70 per cent lead per ton. This is an exceedingly fine showing.

**MINING NOTES.**—The Keystone is credibly informed that the Vienna Co. will expend \$60,000 the present season in driving a tunnel that will explore the ground of their mines at Vienna from 600 to 800 feet deeper than their present workings. The same company have purchased the Vishnu property at Rocky Bar.

**ACROSS THE BASIN.**—Idaho World, March 1: Auditor and Recorder Tim Carroll returned Saturday from a week's visit across the basin. Tim informs us that the shaft being sunk to open the second level of the Pioneer mine at Quartzburg is down 70 feet below the upper level, the shaft for this level having been sunk 100 feet. The shaft will be extended down 150 feet for the second level. The mill will start up in about two weeks. There are now 400 tons of ore in the mine and 200 tons in the mill. The Pioneer is the property of the Gold Hill Co. Dave Coughanour of this company has put men to work in the Yellow Jacket mine at Quartzburg. The Yellow Jacket is owned by Mr. Coughanour individually. John Ellis & Co. have been prospecting all winter for a ledge in Sailor gulch near Placerville.

#### MONTANA.

**REPORTED IN BONANZA.**—Inter-Mountain, March 2: It is currently reported and generally believed in the Phillipsburg country that the San Francisco tunnel is in Bonanza, with a big showing. No figures relative to the strike are known, as the company's affairs are kept from the public knowledge as much as possible, but this has leaked out. It has been understood all along that the tunnel or adit, which is now in on the vein for a distance of about 1500 feet, crossed the tops of several ore chutes in its course, and the report that another has been cut is readily credited. This strike, however, is believed to be richer than any yet made.

**THE COMBINATION COMPANY'S MILL.**—At the meeting of Combination company trustees last night it was decided by resolution to start the mill up as soon as a sufficient quantity of ore is on the dump to insure a continuous run—say about 1000 tons. They expect to have that much ore out by the early part of April.

**THE HOPE COMPANY'S STRIKE.**—The Hope company has just made a valuable strike in their Silver Chief mine, which is in the granite some distance southeast of the limestone hill out of which they have taken such quantities of wealth in the past. The Silver Chief ore body is about 14 inches wide and runs about 150 ounces.

**NEW GRANITE WORKS.**—The New Granite mill has not yet been located. The company desires, if possible, to so locate it that a tramway may be built directly from the mine to the mill. The smelter project is still talked of also, and its location will necessarily be determined largely by the question of convenience to fluxes.

**THE BI-METALLIC.**—The Bi-Metallic is shipping about \$50,000 worth per month of 300-ounce ore, and taking out a considerable quantity of ore of lower grade.

**WILL DOUBLE THE CAPACITY.**—Inter-Mountain, Feb. 24: Work is being pushed energetically on the Anaconda Company's new smelter at the Valley City, about 700 men being employed upon it. The foundations are now in (a big work in itself), and the excavating for flue-ways to the big chimney is well along. Instead of having a separate stack for each furnace, as is customary, one big stack is in the new smelter to answer for all. Its height is 125 feet and the flue-way is 16 feet square. There will be 32 furnaces in the new smelter, which will more than double the capacity of the works. The works at present treat 1400 tons of ore per day, and the new smelter will increase the capacity to about 3000 tons per day. The work will be completed about the middle of the summer. Anaconda expects a big boom to result from starting up the new works.

**FIRST HUNDRED TONS WORKED.**—The Poor-man is producing daily 10 tons of better grade than any heretofore produced from the mine. A contract has been let for 200,000 feet of lumber to build a new concentrator. Supt. Clark will be in Butte in a few

days. The following dispatch from Mr. Clark to Secretary Warren explains itself: "Telegram from Holden says, first 100 tons worked, and assays 62 ounces silver, 61 per cent lead. Would net on yesterday's quotations \$73 75 per ton."

#### NEW MEXICO.

**STARTED UP.**—Silver City Enterprise, March 2: The Wynnan at Stein's pass has started up with a full force. The Beck and Bachelor are shipping to El Paso. Dr. F. M. Endlich, the former manager of the Lake Valley mines, is the superintendent of the smelters at San Pedro, Santa Fe county. Mr. Griffith, engaged in mining at Shakespear, says that if there had been proper management at the camp 1000 men might be at work there. Five bars of silver bullion were shipped from Georgetown recently by Geo. O. Smith, and some by Payne, Washington & Co., who did some custom milling before shutting down for lack of water. Col. W. S. Morrow has arrived from Washington and purchased Jack Fleming's D. S. C. B. ten-stamp mill, and will move it to Shakespear for the Hercules Co., which will soon be operating. There are now ten bars of silver bullion in the Silver City National Bank, the property of Sheridan & Fleming, as the product of a two weeks' run on Uncle Sam ore by the Bremen mill. The bars are worth about \$1200 each, on an average. Several other bars will be cast before the shipment is made. J. L. Mason of Kingston has placed in Kansas City, three mines in the hands of local capitalists, at a total capitalization of \$1,200,000. He says that hundreds of moneyed men are seeking for information at the Exchange now, and is sure Kansas City is destined to distance St. Louis as disburbing point for the mines of the west.

**COONEY CAMP.**—Cor. Silver City Enterprise: M. Cooney was interviewed to-day. He says: "The Coats contract on the west side of the mill is being pushed rapidly. The contract price is \$4.75 per foot. The contractors have found soft gouge, and the whole face of the tunnel is in ore carrying sulphides of silver and pure gold in sufficient quantities to satisfy all parties concerned. Vingo's contract on the north side is a fac-simile. The contractors are averaging from 2 to 2½ feet per day. It is, according to the old-timers, as good as the best prospect ever discovered in the Mogollons. A railway tram will carry ore from Coats level to the grizzly and from the Vingo tram the same. The broken weather has prevented the mill being completed, as the teams could not get over the mountains with the necessities for completion." The captain is sanguine that, fair weather permitting, his mill will be running inside of 30 days. It is the intention to add five stamps more as soon as possible.

#### UTAH.

**GOLDEN TREASURE.**—Salt Lake Tribune, March 2: The Golden Treasure mine, near Silver City, Tintic district was a large producer of ore a few years ago, and has lain idle some three or four years. The old shaft is down 300 feet, from which several levels have been run. Since shutting down work on this old part of the mine, the cuttings have so caved in as to prevent going in. A few months ago work began at a shaft 633 feet away and at a point 178 feet lower than at the surface of the old shaft. The new shaft is down 160 feet, from which drifting has been done—but not in a straight line—a little over 500 feet, leaving about 180 feet to connect with the old works on the 300-foot level. In driving this drift, they run 350 feet before getting ore, and lately have commenced stoping from a chute 65 or 70 feet broad and from 18 to 24 inches wide. From these stopes ore is being shipped that runs about 40 ounces silver, \$3 to \$4 in gold, 35 per cent iron and 15 to 17 per cent silica. It is 180 feet from the drift up to the surface, and this is believed to be good stoping ground all the way up. With this chute, and the chute in the old workings, it is believed that the property will soon become a great ore-producer. The drift cut clear through that ore chute and only a few days ago struck another ore chute which shows at the head of the drift 16 inches of ore that assays 27 to 30 ounces silver and 35 per cent iron, and when our informant saw it, the ore was improving in appearance. The property belongs to a company, of which Thomas Marshall is president and J. E. Dooly treasurer. The Tesoria lies at the west, and the Julia Lane at the south, both being good properties.

**ORE AND BULLION SHIPMENTS.**—Park Record, March 3: The Mackintosh sampler has received no ore the past two weeks on account of bad roads from the mines. During the week the Crescent shipped 165,000 pounds of first-class ore. On the 1st inst. (Thursday) the Ontario shipped 38 bars of bullion containing 22,785 fine ounces of silver. The product of Duly bullion from the Marsac mill the first of the week was six bars, 7729 fine ounces, and on Thursday another six bars, 7117 fine ounces of silver, were turned out.

**DEER VALLEY.**—Reports from the Deer Valley Consolidated are very encouraging, and some good-looking stuff has lately been brought in. Mr. Schenck will have his contract (that of driving the tunnel a distance of 300 feet) finished in about six weeks, by which time it is hoped an agreeable surprise will be uncovered. The completion of this contract will make the tunnel nearly 500 feet long, and the persistent owners certainly deserve success.

#### WASHINGTON TERRITORY.

**DISCOVERIES.**—Cor. Portland Oregonian, March 3: Several persons who have recently come in from the Okanagan mining region give flattering accounts of prospective developments and new discoveries, not only in the Simlun river camps, but far to the north, near the British line. The early disappearance of snow in that section has enabled miners and prospectors who wintered there to resume work much earlier than was expected, and several promising discoveries have plunged the entire district into a briskness bordering upon what might be termed almost a genuine excitement. The new discoveries are near Wanicut lake, 12 miles south of the British line and 20 miles west of the Okanagan river. Judging from present indications, the Okanagan country will be visited this season by many thousand miners and others, and if the present flattering prospects hold good, one of the richest mineral-producing districts in the West will be added to the wealth of Washington and Oregon.

— THE —  
DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

## AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a snitable

### Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

**TATUM & BOWEN,**

34 and 36 FREMONT STREET,

SAN FRANCISCO, CAL.

Manufacturers of Mining and Sawmill Machinery, Engines, Boilers, Etc.

## HOISTING ENGINES FOR MINES.

1, 2, or 4 Drums, with Reversible Link Motion or Pat. Improved Friction.

MADE ONLY BY THE

**LIDGERWOOD M'FG COMPANY,**  
96 Liberty St., New York.

PACIFIC COAST AGENTS,  
**PARKE, LACY & CO.**  
SAN FRANCISCO.

## THE ROLLER ORE FEEDER

[Patented May 23, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

**Golden State and Miners' Iron Works,**  
Sole Manufacturers,  
527 First Street, San Francisco, Cal.

**H.H.H. HORSE LINIMENT.**  
FOR MAN OR BEAST.  
P.O.T. 1864.  
THE H. H. H. Horse Liniment puts new life into the Antiquated Horse! For the last 14 years the H. H. H. Horse Liniment has been the leading remedy among Farmers and Stockmen for the cure of Sprains, Bruises, Stiff Joints, Spavins, Windgalls, Sore Shoulders, etc., and for Family Use is without an equal for Rheumatism, Neuralgia, Aches, Pains, Bruises, Cuts and Sprains of all characters. The H. H. H. Liniment has many imitations, and we caution the Public to see that the Trade Mark "H. H. H." is on every Bottle before purchasing. For sale everywhere for 50 cents and \$1.00 per Bottle.

For Sale by all Druggists.

**San Francisco Cordage Factory.**  
Established 1856.

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarsed Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice  
**TUBBS & CO.**  
611 and 613 Front St., San Francisco.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

## H. P. GREGORY & CO.

Cor. Fremont and Mission Sts.,

San Francisco, Cal.

MILL SUPPLIES AND LUBRICATING OILS.

## JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. | D. C. WICKHAM, Taylor Mine, Greenwood, Cal.  
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.  
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,  
And will furnish descriptive Catalogues and quote prices upon application.

## List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING FEBRUARY 28, 1888.

- 378,762.—LOCOMOTIVE SMOKESTACK—P. J. Brown, Winslow, A. T.  
378,825.—PAINT—H. Burnett, East Portland, Oregon.  
378,576.—CORSET-STEEL PROTECTOR—Ellen Cushing, S. F.  
378,581.—HARVESTER—M. P. Farnham, Germantown, Cal.  
378,833.—FIRE ESCAPE—Gavin, Cromer & Cromer, Eureka, Nev.  
378,834.—WRENCH—Gavin, Cromer & Cromer, Eureka, Nev.  
378,589.—ADVERTISING CLOCK—G. Hoisholt, Watsonville, Cal.  
378,590.—HYDROCARBON BURNER—H. L. Howse, S. F.  
378,450.—ORE CRUSHER—S. Kendall, S. F.  
378,455.—CRIB BEDSTEAD—Carrie Morse, S. F.  
378,520.—MANUFACTURE OF PAPER—Pearce & Beardsley, Oakland, Cal.  
378,556.—MAGAZINE GUN—E. E. Redfield, Linkville, Ogo.  
378,721.—MEANS FOR PREVENTING THE CREEPING OF RAILS AND RAIL JOINTS—J. J. Reilly, Spokane Falls, W. T.  
378,528.—CORRECTING DEVICE FOR SHIPS' COMPASSES—L. Siricix, S. F.  
378,809.—RAILWAY SWITCH—W. H. Stowell, Eureka, Cal.  
378,819.—STOCKING—Frank Wilcomb, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

**COMBINED HARVESTER AND THRASHER.**—Moses P. Farnham, Germantown, Colusa Co. No. 378,581. Dated Feb. 23, 1888. This apparatus for thrashing grain is designed specially to be used on hilly and uneven land. The machine may be drawn independently or without the header when desired to any point where it is to remain stationary while thrashing, and driven by means of a belt from an engine, but it may, however, be used in connection with a header or cutting apparatus. A number of details of construction and combinations of devices are covered by this patent.

**CORSET STEEL PROTECTOR.**—Ellen Cushing, S. F. No. 378,576. Dated Feb. 23, 1888. This is one of that class of protectors for corset-steels in which an auxiliary piece of steel is employed to stiffen a previously broken steel or strengthen a perfect one. The improved protector is made of a single independent strip of metal bent longitudinally, and fitted over or embracing the steel of the corset, this piece or strip having its folds of unequal lengths, and projecting beyond the steel, whereby it may be fastened to the corset. The independent strip is provided with slots or eyes for the passage and exposure of the hooks and eyes of the corset-steel.

**HYDROCARBON BURNER.**—Henry L. Howse, S. F. No. 378,590. Dated Feb. 23, 1888. This apparatus is designed for the combustion of hydrocarbons and especially gasoline, benzine, naphtha, or the lighter products of petroleum or gas. It consists of water-chambers connected together, a means for keeping up a supply and maintaining a level therein, and a double-chamber burner having small connecting pipes or passages between the upper and lower portions, together with a safety screen and certain details of construction. The device is intended especially to be fitted to stoves or ranges, and as it extends across the full length of the fireplace it will be seen that by means of the partition a fire may be confined to one side of the stove when but little is needed, or by using both compartments this fire may be made in the whole of the stove.

**ADVERTISING CLOCK.**—Gustav Hoisholt, Watsonville, No. 378,589. Dated Feb. 23, 1888. The invention relates to that class of advertising devices in which printed matter, cards, etc., are temporarily exposed to view and again withdrawn, and especially to those devices of this class in which the operating mechanism is dependent upon and is combined with audible clockwork, the whole being consequently known as "advertising clocks." The invention consists essentially in the combination of independent pivoted levers, which are each attached to the card or other matter to be advertised, and a rotary cylinder provided with a cam, preferably a cam groove, or slot, and against which said cylinder the ends of the levers impinge, whereby they are held in and returned to one position, when the solid periphery of the cylinder is traveling against them and allowed to fall to another position by their ends dropping into the section of the cam groove of the cylinder successively. In this way, as each lever drops, the card to which it is attached is exhibited at the aperture or window in the clock casing, and is not withdrawn

until another lever drops to exhibit its card, and so on continuously.

**GATE.**—Robt. B. Lyon, Sonoma, assignor of one-half to Thos. S. Glaister. No. 378,056. Dated Feb. 14, 1888. This is one of that class of self-operating gates in which the gate is mounted on a double inclined plane, up one side of which it is caused to travel by the primary force applied, descending the other side and completing its movement by gravity. The double inclined track, in connection with the guide track and the gate mounted between them, enables the inventor to put both tracks out of the roadway and yet perfectly support the gate as it spans the road. This patent covers "a gate and a double inclined track on which it travels, in combination with operating cords and the means for attaching the cords to the gate, consisting of a pivoted lever to which the cords are attached, said lever being in the top center of the gate, and having its lower end forked, a sliding bar mounted on the gate, and having a pin playing between the arms of this lever, and a chain or cord connecting the bar with the gate-post, of such a length as to move the bar longitudinally at the end of each movement of the gate, whereby this pivoted lever is thrown from one side of the gate to the other and locked."

## Mining Share Market.

There has been some little fluctuation in the mining share market during the week, the Gold Hill stocks having advanced more or less.

The following mining companies have cash on hand according to the statements placed on file:

Alpha, \$24,973.48; Andea, \$3498.64; Alta, \$27,641.86; Belle Isle, \$2787.59; Belcher, \$5358.92; Bullion, \$25,563.57; Bodie, \$26,586.05; Best and Belcher, \$5493.84; Bulwer, \$4417.03; Crown Point, \$6183.85; Consolidated Imperial, \$9338.58; Challenge, \$13,692.10; California, \$2114.57; Confidence, \$694.99; Con. California and Virginia, \$192,085.25, besides \$160,000 in bullion at the mill and further shipments to arrive before the end of the fiscal month; Chollar, \$2891.11; Crocker, \$625.57; Commonwealth, \$3632.59; Dudley, \$616.16; Eureka, \$46,000; Eschschner, \$2404.81; Foundry, \$756.94; Gould and Curry, \$2222.97; Hale and Norcross, \$230.12; Independence, \$442.65; Julia, \$1096.23; Justice, \$9235.26; Lady Washington, \$8483.55; Mono, \$25,486.33; Mexican, \$20,822.08; North Belle Isle, \$51,410.81, besides \$88,000 in bullion at the mill; Ophir, \$10,869.94; Overman, \$36,032.85; Occidental, \$7633.06; Orleans, \$531.59; Ponder, \$19.10; Peer, \$1785.30; Peerless, \$10,534; Syndicate, \$10,317.89; Sierra Nevada, \$8162.49; Standard, \$74,136.71; Utah, \$13,701.46; Union, \$35,390.03; Weldon, \$5487.39.

The following have an indebtedness: Grand Prize, \$33,048.49, but has an offset of bullion in the local office amounting to \$23,836.48, also a \$15,000 shipment which is now in transit; Holmes, \$12,119.04; Keyes, \$12,269; Mt. Cory, \$47,977.15; Nevada Queen, \$11,876.07; Navajo, \$5771.56; Potosi, \$20,734.20; Seg, Belcher, \$15,668.75; Savage, \$38,103.36, but has unsold bullion on hand amounting to \$9500, with further shipments to arrive.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Grand Prize, March 3, \$15,000; North Belle Isle, 3, \$88,000; Con. California and Virginia, 6, \$170,000; Hanauer, Feb. 29, \$5665; Germania, 29, \$3497; Hanauer, March 2, \$4890; Germania, 2, \$1650; Queen of the Hills, 2, \$1010; Germania, 3, \$1631; Hanauer, 3, \$2225; Silver Reef for Feb., \$27,245; Eureka Con., 5, \$15,000; Mt. Diablo, 5, \$15,770.

## Our Agents,

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

F. E. LOAN—Santa Clara Co.  
JOHN C. H. LAMPADISI—Monterey and S. L. Obispo Co.'s  
G. W. INOALS—Arizona Territory  
WM. WILKINSON—Stanislaus and Merced Co.'s  
A. F. JEWETT—Tulare Co.  
C. E. WILLIAMS—Yuba and Sutter Co.'s  
R. G. HUSTON—Montana Territory  
G. H. SCHAEFFLE—Calaveras Co.

**THE Dr. Bredsmeyer**, who has been trying to starve himself in the jail at Salt Lake, is a mining engineer who formerly resided in California, but who has been in Utah some years. He lived for many years in Siam and in China, and has always been connected with mining matters.

The report of the United States Sub-Treasurer for February shows the following amounts of money in the vaults at San Francisco: Gold coin, \$28,698,401; currency, \$556,115; standard silver dollars, \$18,373,501; fractional silver \$6,969,185; minor coin, \$8597. Total, \$54,635,799.

The best way to "boom" a mine is with pick, shovel, drill and powder. There are apt to be results from that kind of booming. The best way to furnish "wind" for mining operations is from an air-compressor.

**BARNEY COYLE**, a miner, was caved on in the Ophir mine on Monday last, and badly hurt.

**PIC IRON** has gone up about 50 cents per ton on all grades in the local market.

## MINING SHAREHOLDERS' DIRECTORY.

## New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

**INDIAN CREEK LAND AND M. Co.**, March 1. Capital stock, \$500,000. Directors—F. E. Berge, S. C. Mills, Geo. M. Condes, A. Barker and G. W. Carman.

**CALIFORNIA AND MEXICAN IMPROVEMENT CO.**, March 2. Object, to manage in this United States and Mexico the business of contracting for the improvement of harbors, lakes and rivers; constructing canals, locks and ditches; driving tunnels and building rail and other roads, bridges, telegraph and telephones lines; reclaiming lands, constructing drainage and sewerage works and dams, besides the acquiring, holding and disposing of land. Capital stock, \$10,000,000. Directors—William H. H. Hart, B. F. Tuttle, James A. Johnson, J. V. Ellis, J. K. Luttrell, P. D. Wigginton and John P. Irish.

**PACIFIC BAKING CO.**, March 5. Object, to build cracker bakeries in California. Capital stock, \$50,000. Directors—H. W. Brown, J. A. Campbell, Frank Kohi, J. P. O'Brien and Carter Tevis.

**Complimentary Samples.**

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

The demand for lumber for the past months of the present year has been exceedingly brisk. A single company of the city received during January 20,600,000 feet of lumber, and sold during the same month 18,394,000 feet, being a gain of 70 per cent over the corresponding month of last year.

**Books on Working Ores.**

By GUIDO KUSTEL, M. E.

HOATING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and contains full facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3, cloth, postage free. Sold by DEWEY & CO., Publishers, 222 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by DEWEY & CO., S. F. BOUND VOLUMES.—Back files of this paper bound in substantial cloth binding with leather back, containing six months' numbers in each, indexed, can be had at this office at \$4 per volume.

**Dewey & Co.'s Scientific Press**  
**Patent Agency.**

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

# THE HAZELTON BOILER.

## A NEW AND RADICAL DEPARTURE IN STEAM GENERATOR.

DESTINED TO REVOLUTIONIZE ALL FORMER METHODS. A SAVING IN FUEL OF AT LEAST 25 PER CENT GUARANTEED OVER ANY OTHER STYLE OF BOILER.

The following parties have these Boilers in use or under construction on this Coast, to whom reference is made:

Spring Valley Water Works, S. F.	1 200 H. P.	Starr & Co. Mills, Wheatport.	1 100 H. P.	San Jose & Santa Clara Electric R. Co.	1 100 H. P.

## IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS, with leve attachment, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under a decision of Sawyer, Judge of the U. S. Circuit Court, in the case of Hendy and Fisher vs. R. Hoskin et als.

We also manufacture the Single-Jointed Giants.

Prices and Catalogues of Hydraulic Mining Machinery furnished upon application.

**JOSHUA HENDY MACHINE WORKS,**  
39 to 51 Fremont St., San Francisco, Cal.

This cut represents our  
**IMPROVED  
HYDRAULIC  
MACHINE.**

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

## PATENT LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning and Salivation.

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, Threshing and Stock-driving, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

Address communications and orders to  
**JOHN TAYLOR & CO., Sole Agents,**  
63 & 65 First St., cor. Mission, San Francisco.

Send for Descriptive Circulars containing Testimonials of well-known parties who are at present using them.

### THE SCIENTIFIC KIT OF TOOLS

Warranted the Best and Cheapest on the market. Can furnish Kit complete or any part of it, leaving out articles parties may have or do not want. Can furnish larger Forges with lever if desired. Also the **SCIENTIFIC GRINDING MILL "The BEST MILL on EARTH."**

**THE  
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

## Electrical Power for Mining Purposes.

The PRESS has several times during the past year called attention to the fact that there are many places in this State, and on this coast, where electricity could be utilized for driving quartz-mills, pumps, hoists, etc., in mining and milling operations. In the central and northern part of California there is plenty of water-power, but it is not always exactly where wanted. But by means of a water-wheel and dynamo, electricity may be generated and conveyed to any reasonable distance and then applied to any power purpose desired. This is done elsewhere, and there is no reason why it should not be done here. There seems, however, to be an idea that this is more or less of an experiment, and everybody wants somebody else to try it first. While many persons know that electricity is utilized for small motors, they are skeptical as to its availability for any large power. This is, however, only a question of size of dynamo, motor, and quantity of original power.

There seems to prevail a rather bazy notion about electric motors and dynamos, whereas the matter, as far as principle goes, is quite simple. A dynamo or electric generator does not run by electricity. It is by its means that electricity is produced, but it must be run by another power, just as a pump or anything else is run. A steam engine or a water-wheel must furnish the power to run the dynamo. Then when it is in rapid motion it generates electricity, which is conveyed by a wire to the point where the motor is placed. This motor is just like a dynamo, running reversed. This runs very rapidly indeed and must be geared down by belts, gears or other device to suit the requirements of the machinery it is to drive. The power thus derived is subject to control, and the machinery may be started and stopped as desired. The idea that many have that an electric engine runs in some way on its own book is entirely wrong. The advantage to be gained is that the power may be transmitted to long distances—several miles—from its original source without having to use belts, wire ropes or other moving objects. The plant once furnished, where there is water-power, there is no further expense outside of ordinary maintenance. As will be seen by an article in this number of the PRESS, the Big Bend Tunnel Company is about to run its machinery on the river by means of this power.

The Alien law applies only to Territories and the District of Columbia. There is no law that prohibits an alien from purchasing and working mines in California, Nevada or any other State, but he cannot acquire title to a mine by location, as that right is reserved to citizens of the United States or those who have declared their intention to become such.

## The Economizer Engine and Boiler.

The accompanying cut presents an illustration of a simple, substantial form of a center crank portable engine and boiler, aptly denominated the "New Economizer."

The boilers are constructed especially with a view of insuring the consumption of a minimum amount of fuel. The engines are built either with center or side cranks; they are perfectly balanced, and vibration at the maximum of labor is reduced to the least possible amount. They can be run to a very high speed and are so mounted that they can be detached from the

## Saving the Mineral Lands.

The Montana people are evidently in earnest in the matter of preventing the railroad company from absorbing the mineral land in their land grants. The residents of various sections are subscribing liberally to the fund to send representatives to Washington, notwithstanding the report by interested parties that only a junketing trip will result. Outside of the petition and affidavits, the case will be presented in Washington by men selected to do so, and it is very probable that they will accomplish their object. Although the mineral

## Oil in Life-Floats.

Captain Herbert H. Williams of Thomaston, Maine, has obtained a patent through the MINING AND SCIENTIFIC PRESS Patent Agency on an attachment to a life-float, buoy or life-preserver or anything of the kind designed for supporting bodies in the water and preserving life. Capt. Williams provides such floats with a reservoir for oil, this reservoir having a novel outlet, whereby the oil may escape automatically, no matter on which side the float or ring buoy may be turned when thrown into the water, or to which it may be thrown by the waves, when once in the water.

The general and well-known object is, by means of the escaping oil, to calm the surrounding water sufficiently to enable the float to be discovered at a longer distance than it otherwise could be, and also to provide for a calm space about the float for the preservation of life and the convenience of the person supported by the float. The common ring-buoy, used for the purpose of throwing to a man who has fallen overboard, is provided with a reservoir for oil, so arranged that the oil will escape automatically, without reference to the position of the buoy when floating.

It is not new to supply oil reservoirs to life-rafts, but these have generally had a complicated system of cocks and outlets to allow the oil to flow. The plan has not been adapted to the common life-buoy, and, moreover, there has been no arrangement to provide for the automatic flow of the oil.

In Captain Williams' life-buoy a pipe encircles the buoy and forms a reservoir for the oil. It may be placed inside the buoy or outside.

Wherever placed, an outlet pipe leads from the encircling reservoir in the direction of one side or surface of the buoy, and a similar outlet pipe leads in the direction of its other side or surface. When the buoy is hung up in the usual manner these outlets are at the top, and the oil cannot flow out. But when the buoy is launched overboard, no matter on which side it may fall or on which side it may subsequently turn by the action of the waves, the oil will flow from the outlet which then happens to be extending downwardly. This is the advantage of the double oppositely arranged open discharge from the reservoir. No matter what may be the construction of the reservoir itself, the oppositely arranged open outlets may be applied with equal advantage and in every kind of life-float.

PROSPECTORS who have recently been to Death Valley say the country is full of quartz veins. These men think they will find the famous Breyfogle mine which has been the dream of prospectors for years.

It takes 270 inches of water to run the 40 stamps and 20 pans of the Chollar mill,

THE "NEW ECONOMIZER" PORTABLE ENGINE AND BOILER.

top of the boilers and placed on separate foundations and used as stationaries, and as such can be operated as either right or left hand, as the power can be transmitted from either side.

They can be mounted either on wheels or wheels, as the conditions of use may require. Mounted on skids, these "New Economizers" are built of a capacity of from 3 to 20 horse power, and will be found serviceable for pumping water, sawing wood, farm and dairy uses, running small machine-shops, sewing machines, and for many other purposes where small powers may be required.

Mounted on wheels, they form agricultural engines complete for threshing, and have been found very successful as straw-burners, and with a simple change of grates are equally well adapted for burning either wood or coal. Numbers of these engines are being sold by the Joshua Hendy Machine Works, the Pacific Coast agents.

GOVERNOR WATERMAN has purchased the interest of Juan M. Luco in the Stonewall mine. This leaves the Governor sole owner of that valuable property.

land is specially reserved from railroad grants, and there is a law against its being taken up as agricultural, a great deal has been taken out of the public domain. This, of course, reduces the area for prospecting and puts in the hands of private parties tracts which should support the mining population.

This has occurred to a greater or less degree in all the Pacific States and Territories. Attention has frequently been called to the matter, but no such vigorous steps have been taken to prevent the unlawful absorption of the mineral lands as those the Montana people are now taking. Their efforts will result in bringing the subject forward as it should be. If matters go on in the way they have for some years, it will not be long before a large proportion of the mineral lands belonging to the United States will be in the hands of private parties.

FOUR companies are mining near Rye Patch and one company is working in San Jacinto, west of that place.

THE Father de Smet and Deadwood-Terra mining companies are not to be consolidated, as reported.

## CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

## Calaveras County Mines.

## Copperopolis.

EDITORS PRESS:—Copperopolis, after a sleep of many years, has been jostled, put on its feet and set going by the present activity in the copper market. The town looks to the Union copper mine for its support. When in 1866 this mine closed down, Copperopolis put up her shutters, "called it a day and quit." When in January, 1888, the mine resumed, Copperopolis took down, one shutter at a time, her closed-up fronts, and is still suspiciously thinking it too good to be true and keeping a few closed. But the croakers will soon give way before the active operations of the Union mine. The Union copper mine was discovered in 1860 and became the property of Messrs. Ames & Glidden of Boston, by whom it is at present owned and operated. The mine is secured by a U. S. patent and covers 200 feet in width by one mile in length. In January last Messrs. Ames & Glidden concluded that if there was anything in the mine it should be worked or sold, or if worthless, shut down, as the expense of watchmen, repairs and taxes had cost them the snug sum of \$50,000 during the mine's idleness. Accordingly, their agent, Mr. H. D. Randlett of San Francisco, put the well-known copper superintendent, Mr. J. H. Ferson, in charge, and a charge it proved to be, for in consequence of the many years' idleness, the machinery had well-nigh fallen to pieces. With the mine filled with water all these years, the timbers had decayed so that when the water was taken out cave after cave occurred, and at times it seemed as though the old workings must be abandoned; but skill, experience and patience overcame these obstacles and the mine was once more opened for examination. To the surprise of the superintendent it was found that the ore bodies were almost intact, and the character of the ore and value far above his most sanguine expectations. The ore proved to be not only free from all conflicting metals, but to contain a larger average per cent of copper than any like mine on the coast, and of greater body. The vein carries an average width of 15 feet, with 16 per cent copper, and with drifts and shafts to prove its character for 1000 feet.

The surface developments are four shafts on the Union proper of 300, 500 and 550 feet depth, covering 1000 feet on the length of the lead. On the Keystone, a side location tapping the vein on its pitch, and proving its character for a distance of 1500 feet, are three shafts of an average depth of 300 feet. At each 100 feet, levels have been run an average of 1000 feet. In consequence of these thorough and extensive developments, all that remains to be done is to rebuild the hoisting and pumping plants and the mine with its large bodies of high grade ore is all ready for stopping and can soon make a record for itself as a copper-producer. Working but one shaft with a limited force has enabled the superintendent to ship 700 tons, with the ore-sheds full of ore awaiting shipment. Once the machinery is reconstructed, the mine can excel its former record of 70,000 tons from 1860 to 1866, as thousands of feet only want stopping. It is reported at Copperopolis that an English syndicate will purchase and operate the mine. Why our California capitalists should allow so good a thing to go out of our country is a mystery. Messrs. Ames & Glidden are well-known railroad men and manufacturers, with no desire to continue in mining, and hence offer the property for sale at a price far below the actual cost with the question of present value not considered. Developed as the mine is, it may easily be examined and tested. With an immense amount of ore in sight, copper high in percentage (16), and the price of copper going higher, with no possibility of a fall for two years at least, but every reason for an advance, makes the ownership of the Union copper mine an assured bonanza to whoever may become the fortunate possessor. E. H. SCHAEFFLE.

Murphys, Cal.

## More Light!

EDITORS PRESS:—Can you inform me if the scientific gentleman who invented the cosmic ether devised any plan by which that imponderable, perfectly elastic fluid which permeates and traverses all ordinary matter without resistance, and which admits of the passage through it of any body of any form and with any velocity equally without resistance, can impart to our organs of sight, either directly or through the agency of air, those vibrations which produce in our brains the sense of sight?

It would seem that a fluid such as the ether is said to be, and such as it must be in order to fill the role assigned to it, could not have friction nor impact upon gross ponderable matter, could not hit anything, so to speak, and consequently would find a difficulty in imparting any vibrating, undulatory or other mode of motion which it might cherish in its own bosom to any body else, and I feel uneasy about it; and if it cannot, how is it that it does? or does it? or is there any such fluid? and if there is not, how does light contrive to crawl through a hole which is plugged by a vacuum? EN!

## Mines and Mining in Mexico.

## History of Minas Nuevas or "New Mines," State of Chihuahua.

EDITORS PRESS:—These mines were discovered in the early part of the 15th century by the Jesuit padres and caused a great excitement at the time because of their extent and richness. Soon after, the city of Hidalgo del Parral was founded on the Rio del Parral.

The mines, which were very rich, even on the surface, were worked in a primitive way by Mexican Indians, peons, under the direction of the padres. Notched poles were the only ladders used. All ores taken out had to be brought to the surface on the backs of peons, and turned over to the padres, who had them packed to their smelting works and arastras near Parral for reduction.

These Indian peons were very superstitious and nothing could induce them to extend their works more than 200 feet below the surface. At all times they had to be closely watched to keep them from pilfering the rich ore. They received for their labor, rations, meted out to them, barely sufficient for their support, and were obliged to go nearly naked.

These mines have been continually worked since their discovery with occasional interruptions caused by revolutions and by raids of the hostile Apaches and Yegui Indians, both powerful tribes, able, when combined, to hold their own against the troops sent to subjugate them.

The Jesuits built fine churches at enormous expense with a part of the wealth taken from the mines, though the larger portion, in their early history, fully three-fourths of the silver extracted, was sent to Spain. The City of Hidalgo del Parral was also built from their proceeds. We are without exact knowledge as to the amount of money taken from these mines, though it is known to have amounted to many million ounces of silver.

Parral flourished and became a city of many thousand inhabitants, but the frequent changes in the Government and other causes reduced the power of the Jesuits and the prosperity of the city, and the mines took a backward course. In consequence of this interference by the civil authorities, the Jesuits partly abandoned these mines about 1740, as the records show. After this the underground workings being neglected, went to decay. The blocks and pillars of ore left to support the openings, through the effect of moisture and exposure to the air, crumbled away and the vein matter and the walls being without support caved in, filling up the stopes and drifts. Timbering was not practiced here, and the vein being large, in many places over 40 feet wide, and the ore soft, the mine, as a matter of course, soon became unsafe and badly blocked up.

Though they have in part been worked so long and have turned out so much bullion, these mines, so far as exploration goes, may be said to be comparatively new. Only a few of them have yet been worked to a greater depth than 300 feet on an incline of 55 degrees. The deepest workings here are of modern date, and are yet fully 350 feet above the line of permanent water. The modern are more than 100 feet deeper than the ancient workings, the vein still continuing of great size and the ore very soft, owing to which condition of things large pillars and blocks of ore have still to be left standing to support the walls and the openings.

For many years there was little done to give the city of Hidalgo any life. During the past few years foreigners becoming aware of the value of these mines visited and found them mere "gopher holes," none of them developed over 200 feet below the surface.

By their superior knowledge of mining and their influence with the more wealthy class of Mexicans these foreigners have been able to explore the mines to greater depth. During these more recent years nearly every mine on the vein has had new shafts sunk in solid ground to the depth of 450 to 600 feet, the shafts on the Vetta ground and the Verdi mines having been sunk to a depth of 1150 feet.

The vein grows more solid and ore is of higher grade as depth is reached.

There are now five steam hoisting works on this vein in successful operation. The average ore from the lower levels exceeds 100 ounces silver per ton. The vein extends from point of discovery north 25° west, over three miles without a break, being in no place less than 18 feet between walls. A. J. HOLMES.

Parral, Chihuahua, Mexico.

CON. CALIFORNIA AND VIRGINIA.—The official account of the bullion produced by the Con. California and Virginia during the month of February is as follows: There was worked at the Morgan mill 5000 tons of ore, yielding bullion valued at \$150,214.88, of which \$68,830.65 was gold and \$81,384.23 was silver. The yield in bullion per ton was \$30.04, and the average assay value of the ore per ton per battery samples was \$39.46. There was worked at the Eureka mill 8270 tons of ore, yielding bullion valued at \$186,130.56, of which \$85,356.82 was gold and \$100,773.74 was silver. The yield in bullion per ton was \$22.50, and the average assay of the ore per ton per battery samples was \$31.79. The total amount of ore worked was 13,270 tons, and the total amount of the bullion produced was \$336,345.44. The average yield in bullion per ton was \$25.34.

## The Firewood Business.

The high price of coal and the better use for their time which wood-choppers in some parts of the State are finding, has brought prices of stove wood and charcoal to an elevation not known during recent years at least. The managers of the Donabue road in Sonoma county have issued a circular intended to stimulate the production and shipment of wood over their line to San Francisco. Though the circular in some respects seems to be written in the interest of the transportation traffic rather than of the wood-producer, the statements are interesting enough to warrant publication:

It is a well-known fact that for the past four years the wood business has been carried on at almost a loss to the producers; they have made but little above the actual cost of production. This not only applies to those producers situated where their transportation must be by rail, but the same applies to producers on the coast where transportation to this market is by water. The larger part of the wood coming to this city comes from the coast and balance by railroads leading to the bay. Heretofore on account of the great supply from the coast, prices have been kept down, as buyers use inland producers to beat down prices on the coast and use coast producers to beat inside prices, but the time has come that this can't be done. The coast producers have to a large extent quit making wood and have turned their attention to lumber, railroad ties, posts, pickets and shingles; their reasons for doing so are two-fold. First: On account of the low prices obtained heretofore, and more profit in making the above articles. Second: The fact that they are well aware that after cutting their wood they cannot get it to a market on account of the scarcity of vessels.

For the past six months the demand for vessels to carry lumber, shingles, posts and railroad ties has been so large for San Pedro and San Diego that tugs have been employed to tow sailing vessels from the Sound, Humboldt and Mendocino to the southern coast ports to save time, and the same vessels towed back empty. It has been almost impossible to charter at all for San Francisco, and there are very few vessels engaged in carrying wood. Sailing vessels prefer lumber, etc., to wood, and owing to the difficult and dangerous places for loading, and the high rates of insurance on vessels going to those places, they are asking higher rates for carrying wood than for lumber. It is almost impossible to get a vessel to go for wood at any price. If this is the case during the winter months, while there is hardly any building going on, what can be expected in the spring and summer, when the demand for lumber will be ten-fold greater? The woodmen on the coast can see this and also see that there will be a very slim chance to get wood to market after it is cut, and for that reason are not wasting time and labor in that direction. Even during the winter the demand for lumber in the southern part of this State is far in excess of the supply. This being the case, there is no chance of coast wood coming to San Francisco in any amount. This will cut off at least 50 per cent of the supply and throw almost the entire wood business on to the railroads, and the supply being below the demand, good rates will rule. Wood is selling for more in San Francisco now than at any time in the past ten years. In fact, it is readily taken at almost any price. The largest consumers of wood are the brick-yards, and they have heretofore had more or less wood left over to start the next year's work, but this year they are entirely out of wood and almost out of brick. They must start to making brick as soon as the weather will permit (probably by May 1st), and must have wood at any price. They cannot use anything else. Where is it to come from unless you benefit by this warning and be prepared to meet this coming demand at good liberal rates? You cannot expect to meet this market with green wood after the rush comes.

In order that you may know about who and what the different woods are used for, I will take each separate.

**Pecked or Tan Bark Oak.**—The highest priced wood that comes to this market. It is used principally by the Chinese for stove use and is cut up small. Also used for stove wood by those who prefer wood to coal. Price ranges from \$9 to \$11 per cord when delivered here.

**Block and Live Oak.**—Cut into stove wood and used in place of coal. Also used in some cases for steam fuel. Price ranges from \$8 to \$9.50 per cord.

**White Oak.**—Used by brick-yards and for steam fuel. Price ranges from \$7 to \$8.50 per cord.

**Pine or Fir.**—Used by brick-yards in preference to any other kind of wood. Also used exclusively by the bakers. This is the ch-ch wood and more in demand than any other. Price ranges from \$8 to \$10 per cord.

**Redwood.**—Used by brick-yards and for kindling wood by wood-dealers and the Chinese. Price ranges from \$7 to \$8 per cord.

**Tan Bark.**—Used by tannerie exclusively. Price ranges from \$17 to \$20 per cord.

**Charcoal.**—Used by the Mint, all hotels and restaurants, and by the Chinese. Price ranges from 45 cents to 60 cents per sack.

The rate of freight on above articles to Tiburon will be as follows:

Kind.	Cloverdale and points south.	Points north of Cloverdale.
Pecked or tan bark oak.....	\$2.50 per cord	\$3.00 " "
Block and live oak.....	2.25 " "	2.50 " "
White oak.....	2.00 " "	2.25 " "
Pine or fir.....	2.25 " "	2.50 " "
Redwood.....	1.87 " "	2.00 " "
Tan bark.....	3.15 " "	4.00 " "
Charcoal.....	24.00 " car	30.00 " car

The above rates are for carloads of eight cords of four-foot wood.

When cutting for San Francisco market cut only four-foot wood, as stove wood will not sell. It would be well to consider the fact that a little care in trimming the knots down close when chopping wood increases its value from 50 to 75 cents per cord. The schooner rate on all kinds of wood from Tiburon to any brick-yard, Oakland or San Francisco, is \$1 per cord in lots of 32 cords or over (32 cords being a schooner-load). Along the line of the Cloverdale & Ukiah railroad there are large quantities of fine, large white oak timber, and to those in that section I would state that Ludwig & Kroncke of the Santa Rosa Planing-Mill have made a liberal offer for white oak logs. They will pay \$8 per 1000 feet for white oak logs (cut from the body of the tree between branches) in lengths of 8, 10, 12, 14 and 16 feet delivered on car at any station on C. & U. R. R. and S. F. & N. P. R. R. This is for the full measure of the log inside the bark at the small end of log. This will pay about 45 per cent more than cutting same into cord wood, and balance of the tree can be cut into wood. As the body of the white oak is very large and straight, this item is worthy of attention. They will also buy laurel, maple, locust, ash and oak logs, delivered on cars, at good prices.

In the near future this company will transfer cars from Tiburon to San Francisco, thereby giving shippers a better market and a saving on schooner transportation.

CHAS. THORN, JR.  
General Freight Agent.

## Academy of Sciences.

At the regular meeting of the California Academy of Sciences on Monday of last week, Dr. Harkness presided. Gilbert Palache was elected a life member. The following articles were presented: Shells, by H. W. Turner; fossil shells, by Dr. Harkness; cretaceous fossils from Alaska, by Mr. Tallant. There were received 68 publications as presents to the library. A well-drawn map of Kodiak hay, Alaska, was presented by Adam Petroff of Alaska Territory.

Waldemar Lindgren of the United States Geological Survey, who has recently returned from Lower California, read an interesting paper on "Some Topographical Features of Lower California." He described minutely the topographical features of the northern portion of the California peninsula adjacent to the American boundary. The peninsula is about 100 miles broad; of this, 40 miles is desert country and 60 miles mountainous. The coast slope contains a few small fertile valleys, but is principally of granitic nature and maintains vegetation for a very few months in the year. After this slope is crossed the country is made up of large fertile valleys elevated 1900 feet above the level of the sea. Trees are few, and consist principally of live oak and a species of mahogany. There are no timber trees in the whole country from east to west. The plateau has a very rapid descent which stretches for 40 miles to the coast of the Gulf of California. The minerals in this country are few. Copper has been found in limited quantities. The gold vein, which is no doubt a continuation of that found in Los Angeles and San Diego counties, is evident for about 300 miles in a north and south line, and from 15 to 20 miles east and west. No great discoveries have as yet been made there, but in the course of a few years, no doubt, many paying mines will be discovered.

A paper on "The Macroscopical Examination of Rocks" was read by Melville Attwood. This was given in full in the PRESS of last week.

The payrolls of the mining companies on the Comstock amounted to \$214,544 last month. Some camps would make a great fuss if this much money were paid for labor in six months, and would set themselves up as "bonanza" camps.

The Morgan mill on the Carson will soon commence the erection of a refinery to run in connection with its milling works. The lumber is already on the ground and work will commence immediately.

On the Carson river the run this year will be simply unprecedented. The snow reserves in the mountains are better than ever, and it is not coming down in floods as usual, insuring a steady season's work.

The importation of silver ore from Mexico through the custom house at El Paso during the month of February is 5425 tons, valued at \$246,919, against 5090 tons for January.

The copper mine on Harmony mountain, five miles from Winnemucca, Nev., is to be developed. There are several locations on the vein.

SUTTER CREEK, Amador county, experienced a disastrous fire last week, which destroyed a great deal of the business portion of the town.

# Death of Prof. Asa Gray.

[Written for the Press by J. G. LEMMON.]

Prof. Asa Gray, the most distinguished of American botanists, was stricken with paralysis soon after his 77th birthday, and expired January 30, 1888, at his home in Cambridge, Mass.

Prof. Gray was born in Paris, Oneida Co., N. Y., Nov. 18, 1810. Obtaining a good education at the Clinton grammar school, he then, without entering college, began medical studies in the College of Surgeons of Western New York, receiving his degree in 1831. Becoming early interested in the study of nature, particularly of botany, he left the practice of medicine to prosecute the study of botany with great assiduity under the immediate instruction of the great master Dr. John Torrey.

In 1842 he was elected professor of natural history in Harvard, but during the six years previous he had distinguished himself by the publication of several elementary works in botany that are still models of precision, simplicity and comprehensiveness.

As early as 1838 Dr. Gray with Dr. Torrey began the publication of a "Flora of North America," and ten years after "Genera of the Plants of North America," also "Manual of Botany of Northern United States." Since 1861 he has written many profound articles relating to the evolution theories of Darwin, which he accepted with great caution and with unshaken religious belief. As he himself said: "I am a Darwinian, scientifically and in my own fashion, philosophically a convinced theist, and religiously an acceptor of the Nicene creed;" in these respects resembling Prof. Agassiz and Joseph Henry.

So great has been the devotion of Dr. Gray to herbarium studies that he was able to make comparatively but few excursions. Twice, however, he escaped to Europe for the better study of certain difficult families, and he made three brief visits to the Pacific Slope. On the second occasion he was accompanied by the most renowned botanist of Europe, Sir Joseph Hooker, and it was the good fortune of the writer to receive an invitation to meet them at the State line and become their guide to several of the most interesting points for the study of trees in the high Sierra. Soon after Dr. Gray's return to Cambridge, a very valuable paper appeared on the "Vegetation of the Rocky Mountain Region," followed by several profound papers on "California Forestry."

These, with a few hurried flights into the Alleghenies, to Florida, and to Canada, were all the vacations he gave to the most wonderful mental activity, including 30 years of college lectures, the administration of a botanic garden, the forming of a great herbarium, added to frequent and often very considerable contributions to various publications, notably the proceedings of the American Academy of Sciences, over which he presided for many years, and the American Association for the Advancement of Science, of which he was also president. His able and voluminous contributions to other journals, magazines and newspapers are almost incredible in number and value.

But the great botanist was much more than an ardent, clear-sighted and profound scientist. He was a genial, social, witty, urbane, hospitable gentleman. His great amiability of character was exhibited not only to his neighbors and other visitors to the herbarium, but appeared as well in his life-long personal attention to a large correspondence, which ever increased and became more and more exacting to the last. He employed no amanuensis, writing all letters with his own hand, never left one unanswered, and seldom sent one out without an appropriate statement or a pleasant allusion.

In the year 1855 a portrait in bronze of Dr. Gray was devised by his intimate friend, Prof. Sargent, and presented to Harvard College, accompanied by a carefully prepared epitome or resume of the most important labors of the great scholar. After 15 pages of such condensation, Prof. Sargent writes: "Prof. Gray in 1872 was relieved of college duties beyond the care of the immense herbarium and noble botanical library which he had formed and some time previously had presented to the University. He was now free to take up the 'Flora of North America' and continue the work which the force of circumstance interrupted 30 years before. A flora of North America, however, in these later days is a very different thing from the floras of Michaux and Pursh, or even of Torrey and Gray. The field had widened immeasurably with the strides of discovery and the development of the science, and it demanded closer and more careful research."

As an example of the knowledge of American plants reached during the present century, it will only be necessary to point to the family of *Compositae*, which is believed to comprise from one-eighth to one-tenth of our whole flora. Michaux knew but 193 species, while Gray, 75 years later, published with elaborate descriptions 1610 species, divided among 237 genera. "Two parts of Gray's 'Synoptical Flora of North America' have now been published; the middle part of the entire flora, to wit, the *Gamopetalae*. These volumes comprise 850 closely printed pages, upon which fully ten years of excessive and seldom interrupted labor was required.

"They are masterpieces of clear and concise

arrangement and of compactness and beauty of method. There will hardly be found in any work of descriptive botany a greater display of learning, clearness of vision, and analytical powers, and few works of systematic botany have ever treated of a broader field."

"Their very excellence," Prof. Sargent continues appreciatively, "increases the loss which botanical science would suffer if any other hand were called upon to complete a work now only half finished, and upon which, at least, ten years more of constant and severe labor must be expended. And what other hand could take up this work if Prof. Gray should lay it down? Who, in a lifetime of study, could grasp the details of the great edifice which, for 50 years, has been slowly growing under his hand?"

Alas! These grave apprehensions, uttered only three years ago, are realized, and the great work is now suspended by the removal of the directing hand.

Of the high attainments of Prof. Asa Gray, the records of foreign societies bear even ampler testimony than our own. He was a member of the Royal Society of London, a member, one of the "immortal eight" of the celebrated Institute of France; and long ago he was welcomed into many of the less exclusive bodies of European savants.

Prof. Gray, from an early day, was most intimately connected with the botany of California and the Pacific Slope generally. Every

exploring expedition, every railroad survey, every private explorer, acquired materials that were sent to Harvard for study and determination. Owing to the peculiar and varied soils and climate of the region west of the Rocky mountains, a much larger number of species and more peculiar flora is found here than in all of the rest of the continent combined. And, until within a few years, much of it was unknown. With the rapid settlement of the region, and the advance of detailed exploration, there was a mutual relation of absorbing interest maintained between the Pacific Coast botanists, who hastened into the forbidding, unknown regions of mountain and desert to seize the strange plants, prepare them carefully and then forward to Dr. Gray, who as eagerly and assiduously studied and described them for publication, always mentioning with pleasant comment the collector, and also giving in his correspondence warmer commendation and encouragement, thus maintaining a close bond of sympathy and co-labor between collector and author.

Though receiving at the Harvard Herbarium from time to time the collections of botanists from all parts of the world where exploration is going forward, yet Dr. Gray often declared that nothing caused him such a glow of pleased expectation as the reception of a package of nicely prepared specimens from California or the Southwest; and it is pleasant to recall that the enthusiastic closet-botanist was kept at this welcome occupation much of the time during the past two decades.

Being thus intimately connected with our flora, aiding in its discovery, studying and naming our plants, writing to and encouraging

each of our collectors, it is with especial and poignant sympathy that the botanists of the Pacific Coast join their expressions of esteem and grief with those of the great world of naturalists that are saddened by this sudden departure of their leader in science, and their loving, helpful friend, the good Dr. Gray.

## Mineral Land on Railroad Grants.

An important case has just been decided by the Supreme Court of this State, in which the Court has found that the title to the land in question was not vested in the railroad company and judgment was given in favor of the plaintiff, thus settling title to mineral land on railroad grants. The title of the case is Chicago Quartz Mining Co. vs. John Oliver. We give the decision in full:

This is an action to quiet title. The plaintiff claims under a mining patent issued Aug. 16, 1883. Defendant under a patent issued to the C. P. R. Co., dated April 18, 1870.

The only question is whether the title to the premises in controversy vested in the railroad company under the Act of Congress entitled "An Act to aid in the Construction of a Railroad and Telegraph Line from the Missouri River to the Pacific Ocean," etc., approved

the patent in the railroad company. As stated by appellant's counsel, his contention is that "mineral land did not pass by the grant (to the railroad company), and the officers of the Land Department had no authority to designate by the patent any land which was mineral in character. The law required them to designate only such land as was non-mineral in character, and the issuance of the patent under the law, aided by the presumption which the law attaches to the performance of all official acts, was a conclusive determination that the land designated in the patent was non-mineral, and the reservation in the patent was meaningless."

The Act of Congress making the grant does not in express terms require any officer or officers of the Government to identify and exclude from the patent mineral lands lying within the alternate sections granted to aid in the construction of the road. In the original Act all mineral lands are expressly excepted from its operation, and in the Amendment Act it is enacted that the grant shall not include mineral lands or any lands returned and denominated as mineral lands. "Whatever is included in the exception is excluded from the grant; and it therefore often becomes important to ascertain what is excepted in order to determine what is granted." (Leavenworth, etc., R. R. Co. vs. United States, 92 U. S., 733.)

It is not claimed that the officers on whom was devolved the duty of issuing patents for the lands granted could add anything to the grant. But it is claimed the patent is conclusive evidence; that the grant included all the land covered by the patent. The Supreme Court of the United States has said: "A patent may be collaterally impeached in any action, and its operation as a conveyance defeated, by showing that it had no jurisdiction to dispose of the land; that is, that the law did not provide for selling them, or that they had been reserved for sale or dedicated to special purposes, or had been previously transferred to others." (Smelting Company vs. Kemp, 104 U. S., 636.) This is quoted approvingly in the opinion of the court, delivered by Field, J., in Wright vs. Rossherry, 121 Id., 488.

In McLaughlin vs. Powell, 50 Cal., 64, the plaintiff in ejectment introduced a patent to the W. P. R. Co., from which he derived title to the demanded premises similar to that relied on by appellant in this case and rested. "The defendant then offered to prove that the land was mineral land, containing large quantities of cinnabar and quicksilver, and that he had held the land as a mining claim since October, 1866, under the rules and regulations and customs of miners in the district where the land was situated. The plaintiff objected to the testimony as irrelevant and the Court sustained the objection. The plaintiff recovered judgment and the defendant appealed from the judgment and from an order denying a motion for a new trial." This Court said: "The exception contained in the patent, introduced by the plaintiff, is part of the description, and is equivalent to an exception of all the subdivisions of land mentioned which were 'mineral' lands. In other words, the patent grants all of the tracts named in it which are not mineral lands. \* \* \* We think the defendant should have been allowed to prove that the demanded premises were mineral lands." The judgment and order were reversed.

The doctrine laid down in that case, if applied to the case now in hand, is decisive of it. And we think it in harmony with the cases decided by the Supreme Court of the United States. It has not been overruled in any reported case in this State, although it is claimed to have been in the unreported case of Central Pacific Railroad Company vs. Leavenworth. No opinion was filed in that case, and we are unable to determine from the record that this question was passed on in that case.

Those portions of Finding three which are alleged to be unsupported by the evidence are, in our opinion, immaterial. It is therefore unnecessary to determine whether the evidence is sufficient to justify them. The material facts found are supported by the evidence.

Judgment and order affirmed.

It is reported that the mill at Grantsville, Nevada, will be started up to run on ore from mines in Shamoock canyon. The mill has been idle a long time.

At the Clayton smelter, Idaho, coke costs \$30 per ton. Half coke and half charcoal are used. Clayton is in Custer county, 25 miles above Challis.

THE American Asphalt Co. of Utah are putting up machinery to reduce the crude asphaltum and convert it into a number of forms for the market.

A CARLOAD of borax has been taken from a lake in the vicinity of Rawlins, Nevada, and sent to the Laramie Chemical Works to be tested.

ORES from Choquea district, 30 miles north of Ruby City and the Salmon river mines, carry both lead and silver.

GOLD-BEARING QUARTZ has been found near Rockville, Maryland, and has caused some local excitement.

It is said that a single blast in the Delhi mine, Nevada county, recently, blew out about \$10,000.

THE Idaho mine, Nevada county, in this State, has paid 221 consecutive dividends.

## Passing Events.

The recent terrible storm at New York and throughout inflicted damages to the extent of millions of dollars. It was altogether unprecedented. Railroad and telegraphic communication was stopped entirely, and ordinary street traffic discontinued. Vessels were sunk and many people frozen.

The disaster at Grass Valley from the fire in the drying-house, resulting in explosion of powder and loss of life, ought to be a warning to mining companies not to keep high explosives in any such place. The quantity kept in the drying-house was "for the convenience of the miners," but such a custom should be discontinued.

There is now talk of some good mining-fields in the Big Horn country, Wyoming. This region has frequently been highly spoken of, but there have been no very startling developments. Still it is recognized as a field for prospecting.

There is an abundance of snow in the mountains of this State, assuring a good water season this year.

THE Ontario mine of Utah has produced \$20,000,000 and paid \$9,000,000 in dividends within 10 years.

## Black Hills Tin.

A few weeks ago a shipment of some 76,000 pounds of tin was received in England from the Black Hills of Dakota. Some of the blocks of ore weighed 4000 or 5000 pounds. They were sent to prove to the English that the tin ore in Dakota was of higher percentage than that of Cornwall.

Specimen bars of tin were produced in Dakota several years since, and we have one which was sent us three or four years ago. But while prospecting has been going on more or less, no marketable tin is being produced thus far. Many localities have been examined for cassiterite, but the main discoveries are generally supposed to have been confined to the Northern Black Hills.

We received a few days since some specimens of ore from G. W. McCulloch of Hill City, Pennington county, D. T. These specimens are from the Southern Hills. One piece shows black tin from the Evergreen lode, Bismarck district, Pennington county. The claim is owned by G. W. McCulloch, H. C. Pettit, J. H. McCulloch, A. L. Bishop and W. D. Webster. The other piece is "white tin" from the Dolwath lode, Hill City district, Pennington county, owned by G. W. McCulloch, H. C. Pettit and W. D. Webster.

Mr. McCulloch says he is a reader of the PRESS, and has seen no reference in it to the Southern Hills' tin mines, and thinks also that the references to the Northern Hill mines have not been complimentary. It must be remembered, however, that there are no mines developed, or ore being worked. Thus far only prospecting has been carried on. In the last volume of the "Mineral Resources of the United States," published by the Government, the following reference is made concerning the Dakota tin: "Beyond the accumulation of some piles of ore awaiting examination by concentration, the region cannot be said to have produced any tin in 1886 except specimen bars."

Our correspondent writes us that there is tin enough in the Southern Hills to supply the world, and that all they lack to prove the assertion is the capital to invest for development of their claims. They have tin ore much richer than the English companies can show. They can show mountains of tin-bearing rock in the vicinity of Hill City to anyone who will come to look. There is plenty of water and timber. At present there is a good outlook for the investment of capital. Mr. McCulloch looks for a great deal of tin property to change hands this year. The Etta Tin Co. has a small force of men at work all the time. It is sincerely to be hoped that the Black Hills' tin interest will develop into all the owners hope, for we have produced no tin in this country as yet. We shall be glad to show the specimens of tin ore to any one who will call at the office of the PRESS.

## The Portland Reduction Works.

Mr. Wm. Huntley Hampton, chemist and assayer at Portland, Oregon, writes us to correct some misstatements made in some of the San Francisco papers to the effect that the Portland Reduction Works were a complete failure. He thinks these statements emanated from certain people who would like to see the works fail—those who were unable to make it a success from lack of knowledge, or those interested in competing institutions. He then says: "The works have made three runs. The first two, under the first superintendent, were not successful, owing to lack of knowledge of silver-lead smelting." It appears from this, therefore, that there were some grounds for stating that the works had failed to do what was expected of them.

However, Mr. Hampton tells us that the last run (Feb. 1st to 7th) on the same mixture of ores, under the superintendency of Mr. Oscar Szontagh, was entirely successful, making a record comparing favorably with the best in any other locality. During the run the ores gave out, owing to the freight blockade and the rush ensuing after the cold snap, when the supply was side-tracked somewhere.

The works will start up again in a week or ten days on Cœur d'Alene lead ore and Salt Lake dry ore, and it is expected that a long-continued run will be made. The company are now preparing to erect another stack, to be

ready for use within the next two months. Mr. Hampton is not in any way connected with the Portland Reduction Works, but is desirous that those interested in mining shall know what is now being done with the works at Portland.

## Temporary Disposition of Our Arid Lands.

One of the most difficult and important problems of the day is the proper disposition to be made of the arid lands of the Central and Far West. This region consists of 12 States and Territories, comprising, as a whole, not much less than a million square miles. All of these countries contain a large proportion of these so-called watered lands, the majority of them being made up almost wholly of such lands. While these arid lands, owing to insufficient moisture, are not fit for tillage, they nearly all afford more or less pasturage, some of them producing heavy crops of the native grasses. These are the feeding-grounds of the stockmen, who at the present time number their herds by the million.

While the title to most of these grounds still remains in the United States, they have for the past 20 years or more been largely occupied by the great cattle-raisers, who, by reason of the rapid increase of their flocks, are now beginning to crowd each other in an uncomfortable way. This land being public, giving all an equal right to its occupancy, trouble is to be apprehended between these cattlemen. There have, in fact, been serious difficulties already between the herdsmen of different owners, some of whom have insisted on driving in their flocks on ranges long occupied by others and perhaps already overstocked. As a means of protecting territory so appropriated, many of the larger proprietors adopted at one time the plan of inclosing extensive tracts with wire fencing, which, having been objected to by the Government, had afterward to be removed. To aggravate the situation, the sheep-raisers are beginning now to drive in their immense flocks, insisting that they shall share the scanty pasturage with the horse and cattle men. To suffer this condition of things to continue with the chance of its steadily growing worse, if it does not lead to violence and bloodshed, must inevitably work to the detriment of this important industry.

As a means of preventing further trouble, and as a measure of relief to all, it has been suggested that these arid lands be leased in large tracts to these cattlemen, these leases to be for long terms and at a nominal rent. The only right they would secure to the lessees would be that of pasturage, to which end he would, of course, be allowed to fence in the land set apart to him. Others would be privileged to enter on this land to prospect for, take up, and work any mineral deposits it might contain; also, to locate any agricultural or timber land found upon it.

The selling of these arid lands outright, as was once talked of, is a policy that should not for a moment be entertained. A large proportion of them are known to abound with valuable deposits of the precious metals. They are also rich in the various useful metals and minerals. With the exception of the foothill belt of California, they are the sites of all our gold and silver producing territory. Our coal-fields, our lead and copper mines, our salt-beds and other natural salines are all situated in these dry and nearly rainless regions, and here is where most explorations for mineral deposits are hereafter to be carried on. What of wealth they contain we do not know, nor can we even guess. All that has been revealed may be as nothing compared with what the future will bring to light. How many Comstock may be reposing in the deeply fissured mountains of the Great Utah basin, it may take centuries to find out. The possibilities of the vast interior being so great, our Government cannot be too careful in guarding its resources against monopoly and preserving them for the common use.

The importance of such policy finds apt illustration in the history of Nevada, a country typical of all that pertains to these arid lands. Traversing that State from west to east, we encounter a succession of mountain ranges separated from each other by broad valleys, the whole having a generally north and south trend. These valleys, some of which widen out into

extensive plains, are for the most part without water or timber, but should with grass affording nutritious pasturage for a great deal of stock. The mountains, besides much grass and some scrubby timber, contain numerous small streams. Here only can a sure and ample supply of water for stock be had. Hence, every cattle range must reach to and take in a portion of these mountain lands. But these are also the sites of the metalliferous lodes. With the exception of her horate beds and other salines the mineral deposits of Nevada are located in the mountains and their outlying spurs. And it is safe to say that there is not a group or chain of mountains in the State but which contains gold or silver bearing veins that will some day be worked with profit. There is in fact hardly a mountain in Nevada in which these metals are not now being produced, and in some instances very largely. Not only so, but there is scarcely a county in the State but has some time or another shown up what may fairly be termed a "bonanza." Beginning on the west, we have Storey county with her Comstock, from which there have been taken over two hundred millions; Eureka county, in the center, has turned out at the town of Eureka twenty-five millions; the Manhattan mine at Austin, Lander county, and the Raymond and Ely, at Pioche, White Pine county, have yielded each one-fourth as much; Candelaria, Esmeralda county, is to be credited with a product of fifteen millions; and Bodie, just over the border in Mono county, with twenty-five millions. The Eberhardt, a lenticular mass of ore in White Pine county, and the Sheba, a similar deposit in Humboldt county, have turned out each between three and four million dollars, there being several camps in the State, such as Tiesarora and Aurora, that have produced from five to ten million dollars each.

It is a singular fact that the outcrop of the mines above mentioned was in no instance notable, not having differed in any case from numerous other like exposures in the neighborhood. The Eberhardt vein scarcely showed itself above ground. Nor was the Comstock anywhere prominent on the surface, the finding of some of these mines having been the result of accident. We mention this to show how easily a valuable deposit of this kind may be overlooked, and how good are the chances for finding other and perhaps many of these bonanzas hereafter, even in territory that has already been thoroughly prospected.

But not alone for their mineral wealth and as feeding-grounds are these rainless, timberless regions valuable. What their agricultural capabilities may be cannot now be foreseen, nor can they for the present be determined, though they may ultimately prove to be considerable, possibly very great. The soil throughout the larger portion of them is warm and rich, their element of sterility consisting in their lack of moisture, which perhaps the ingenuity of man and the resources of science may yet be able to supply in sufficient quantity to render them arable.

Our experience in California admonishes to caution in our dealings with these supposed sterile soils. There was a time when, through a general misapprehension of their real character, the best lands in this State could be bought for a trifle—could in some cases even be had for the asking. Now the owner of a few acres of this land is beyond the reach of want or the necessity for severe toil—he is, in fact, a rich man. We should be careful that the mistakes made here are not elsewhere repeated. The selling of large tracts of the great sage harrens of the interior must therefore be avoided. As a temporary disposition of these portions of the public domain, they should be leased in the manner mentioned, but, of course, for grazing purposes only. For every other use existing laws make all needed provision for their occupancy and final disposition.

**EXPLOSION AT THE EMPIRE MINE.**—On Wednesday morning a fire broke out in the dry-house at the Empire mine, Grass Valley, and some 200 pounds of vigrite powder in the house exploded. D. C. Trebilcock was killed and Wm. Shields, John Paul, Chas. Duval and Gordon Manning were injured. The fire caught from the stove in the dry-house. The men in the mine were immediately hoisted out. The dry-house was used for the miners to change their clothes in, but it is not a very good place to keep powder.

### The Honduras Treasure-Hunters.

And now comes the story of another hurried treasure-hunting expedition, the site of the supposed deposit being this time the east coast of Honduras. As the narrative runs, a piratical craft richly laden with gold being many years ago hotly pressed by a British cruiser which crowded the vessel close in on the coast of Honduras, the captain ran through an opening in a reef, and, landing on a sand key, buried there 36 kegs of Spanish doubloons. Two of the crew who had been badly wounded in the fight with their pursuer having died after this landing was made, their bodies were placed in the pit on top of the treasure and the whole deeply covered up with sand. This done, the survivors re-embarked and put to sea, hoping to elude the vigilance of the British man-of-war and then return and secure their booty. But in this they were disappointed; the enemy, being on the alert, attacked the freebooters, and, after a desperate fight, killed all but one of their number, a boy who was spared on account of his youth and because he succeeded in convincing his captors that he had been forced to serve under the "black flag" or "walk the plank."

The name of this lad is not given, nor does it transpire in the narrative vouchsafed us where or how he passed his life from the date of these bloody events till the time of his death, a period covering a good many years. When he reappears, it is as an invalid in an Australian esport, old and poor. Here a certain ex-Judge Davidson of San Francisco, who is making the circuit of the world in his own yacht, falls in with the unfortunate man, and, at the solicitation of the American Consul, taking him on board his vessel, brings him to San Francisco, where he dies soon after, a victim of consumption. The ex-pirate, grateful to the ex-judge for the service so rendered him, discloses to his benefactor the above facts, giving him at the same time a chart, and describing the locality of the grand "cache" with so much fullness and accuracy that the beneficiary was afterward able to find the place without any trouble.

Not for a long time did this ex-member of the California judiciary give much thought to this story of the dead buccaneer. Being flush and in no particular need of adding to his store of wealth, he felt little inclined to undergo the dangers and discomforts of a journey to the distant and deadly coast of Honduras in search of the pirates' "loot." But having at length lost most of his money, he determined to go in quest of the booty, and accordingly did so. He found the spot, and digging down, succeeded in unearthing the remains of the two pirates who had been buried on top of the treasure, but before he could sink much further, the water came in upon him so fast that he was obliged to desist before reaching the more valuable deposits below, or even getting a sight of them. Though compelled to abandon the undertaking for the time being, the judge never lost faith in the dead man's story, nor did he relinquish the purpose of going back at some future time and prosecuting the search to determine results.

Having drifted to New York, our old Pacific Coaster not long since happened to meet there on some convivial occasion a number of pleasant gentlemen, and, becoming chatty over the wine, proceeded to relate to them the foregoing events, setting them forth with greater particularity and presenting them, of course, in much more glowing language than we have here been able to do. Having heard this strange narrative, these gentlemen, all of whom were wealthy, at once "took stock in it." A company was formed, and the ex-judge outfitted, or as we here in California would say, "grub-staked," to go down and prospect for the long-buried doubloons. The good yacht "Maria" was chartered, provisioned and furnished with a select crew, Special Treasury Agent Peck acting as master. On the 12th day of October last she left New York. Owing to a variety of mishaps it was some time before the yacht reached her point of destination. Arrived there, the company disembarked and at once commenced a vigorous hunt for the hurried spoils, but up to last accounts without any marked success. A considerable quantity of human bones with some Indian relics had been exhumed, but the 36 kegs of Spanish doubloons had not been found, nor even so much as one of them.

What the outcome of this expedition will be

it would not be hard to divine. It will doubtless terminate as nearly every expedition of the kind heretofore undertaken has done. We can only wonder at the credulity and folly of the people who engage in them. We are told that this ex-Judge Davidson is an old Californian. We can well believe it. The entire proceeding is characteristic of the veteran prospector. Very familiar to the resident on this coast are these artifices of the "dead-broke" Argonaut. When "strapped" he is a very Munchausen in the tales he tells about "rich strikes" made in distant localities, but which, owing to some mishap, he was not able to turn to account. As in the case of the veritable Judge Davidson, so with these old miners. The water came in and drove them out just as they reached the

HARA'S LINEAL MEASURING REGISTER.

pay-break, or the blood-thirsty savage swooped down upon them at the critical moment, or may be just then their provisions gave out; so confident were they that they had a "big thing" in sight that they staid as long as possible—at their mules, roasted their boots, nor did they leave till the last "stogy" had been devoured. If now some one would hack them up they could go straight to the spot and make a "big raisee." These are the men that know all about the "Lost Ledge," the "Gun Sight Lode" and the many other mythical finds wherewith the mining traditions of California do so abound.

SILESIAIN ZINC FURNACES.

"Yes," says this ex-judge, addressing his friends, "yea, gentlemen, it's there—a million and a half enre—with two such splendid colors in the top dirt we are bound to strike it rich on the hedrock," with a great deal more of the same sort forcibly expressed in the miner's vernacular.

As he failed to get the doubloons, why did not this impecunious person lay out a town site, having a graveyard already started? This was a great oversight; or he might have formed a company and declared dividends on the water, of which there seems to have been a superabundance. Then, too, he might have brought away the bones of the hold buccaneers and utilized them; a couple of pirate skeletons well mounted ought to have proved a drawing card in a dime museum! We fear the man failed to act with his accustomed astuteness, being an old Californian.

From the bunch of rich ore recently discovered in the Delhi mine, Nevada county, this State, four hours' crushing of four stamps turned out \$11,000 in gold. It was all "specimen ore."

The Vulture mine, Arizona, is said to be producing \$1000 a day in gold bullion.

### Metallurgy of Zinc.

In the PRESS of week before last we gave engravings of two forms of zinc furnaces, and this week show the Silesian furnace, the cut of which we take from "Phillips' Metallurgy." In Upper Silesia, where large quantities of zinc are annually produced, the apparatus employed in its metallurgical treatment differs materially from that in use at the Vieille Montagne and in other parts of Belgium. The upper cut is a general idea of the appearance of a Silesian zinc furnace. The distillation is conducted in muffle-shaped retorts, *R*, (see small cuts) of about 3 feet 6 inches in length, and 1 foot 8 inches in height. The anterior face of these is pierced with two openings, *a* and *d*, by the first of which is at-

itself. The reduced zinc passes through the aperture *c* of the bent arm, and is collected in proper vessels placed in the opening *e* left in the brickwork of the furnace. Each operation requires 24 hours for its completion, and the residue, which is a greenish semi-fused mass, is only removed after every third distillation.

The old English process of distillation per descensum is said to afford a larger produce of metal from ores of a given percentage than any other, but from its requiring a larger amount of fuel and from other causes it has become almost entirely superseded in England by the Belgian process.

By the latter method the best varieties of blende may be made and afford about 38 per cent of spelter, while calcine ore of good quality will, after roasting, afford as much as 40 per cent of metal.

The amount of coal necessary for the treatment of one ton of calcine is about 3 tons 7 cwt.; the same weight of blende will require 3 tons 15 cwt. of coal for its elaboration.

### The Big Bend Tunnel.

Electricity to be Utilized.

At the Big Bend tunnel, Butte county, this State, they are now putting in an extensive electrical plant for power purposes. The Sprague Electric Co. of New York are supplying the dynamos and motors, and furnishing the wire. The latter is No. 0 copper wire, about a third of an inch in diameter. There are two dynamo or generator of 80-horse power each, and 12 five-horse power motors for the different places along the river where the power is to be utilized. The electric power is to be used for mining purposes, such as driving pumps, moving holeders, etc. The line will come over the hill and follow along the course of the river, and there will be some 17 miles of main-line wire in all. The original power will be obtained by means of water-wheels placed about two miles below the discharge of the tunnel. An expert electrician will come from the East to place the line and machinery. Centrifugal pumps will be used in the river-bed, and these will be made in this city.

The Big Bend tunnel, which is about 12,000 feet long, has been enlarged this year and is now 13x16 feet. As there will be a great deal of water in the river this season, they will not be able to turn the water of the river into the tunnel before the month of May. They will then begin work at different points on the river-bed where it is left dry. Seepage water and pools will be drained by means of pumps.

All the work at the tunnel has been accomplished and the company has advertised in another column that the drilling machinery, tools, etc., are to be sold. Among other things, the company has started an irrigating ditch which will carry 5000 inches of water. There is a big boom in land thereabouts just now, and they can furnish plenty of water for irrigation. Superintendent Harris was in San Francisco last week buying some pumps and other needed articles.

### A Lineal Measuring Register.

An engraving on this page illustrates Hara's lineal measuring register, which is an attachment for stickere and molding machines. Its advantages are that the dials can be locked up so that it cannot be tampered with. The machine will register up to 100,000 feet, and start again at one; it can also be set back at any time in one minute after completing a job, to start at one. It can also be applied to a saw gauge so that in ripping out stuff for molding the exact quantity can be got out, thereby saving waste.

To mills that run large quantities of molding or matched stuff, this machine will give a correct record of the number of feet each man runs per day, and where a number of machines are in use, will cause a rivalry between the operators, and will thereby increase the output. Some firms who use this machine pay their men so much per thousand feet, and in a short time will make the price of machine. All the parts of this machine are interchangeable, so that should any part be accidentally broken, it can be replaced at trifling expense. Parke & Lacy are the Pacific Coast agents.

By using water-power instead of steam, the Idaho Mining Co., Nevada county, this State, saves about \$35,000 a year.

## MECHANICAL PROGRESS.

## Water Hammer in Steam Pipes.

What is known as water-hammer action is familiar to every one who has had to do with the use of water for heating purposes. The astounding noise, the violent shocks, the excessive vibrations which are set up if a little steam is formed and is then condensed in the pipes, are but too well known. Another instance of water-hammer action is supplied when boilers are blown down, or when scumming takes place, so that steam shall pass into the sea outside. A large ship will shake from stem to stern at such times, cabin doors will open and shut, crockery will go adrift, and the noise made by the water fighting its way into the vacuum and the steam trying to get out, and being condensed in the act, echoes through the ship. Scumming is known to be positively dangerous from the way, in which it shakes the boilers, bringing the scale off the tubes in flakes on to the furnace crowns, where it adheres in such quantity that they subsequently become red-hot and come down. Several years ago a curious experiment was tried by an English engineer. He took a large funnel fitted with a stop-cock and screwed the pipe into the top of a boiler containing steam of about 40 pounds pressure. He then filled up the funnel with cold water and opened the stop-cock. It would naturally have been predicted that the steam would have blown all the water out of the funnel. It did nothing of the kind. On the contrary, the water rushed into the boiler. As a result of this and several other experiments a boiler-feeder was designed and patented and worked with tolerable success. It was found, however, that it was not certain in its action, and the injector coming into high favor at the time, the inventor spent no more money on his ingenious idea. The inrush of the water was due to the fact that the steam condensed in the long pipe of the funnel and "water-hammer" action then drove the water into the boiler. Practically just below the cold water there was always a vacuum into which the water was driven by its own weight and the pressure of the air.—*Ex.*

## The Tool-Room Checks.

The value and necessity of a well-conducted tool-room can scarcely be overstated. It is one of the time-saving, labor-saving, tool-saving and temper-saving arrangements which no thoroughly prosperous establishment can dispense with. But its highest efficacy may be impaired by failure in slight details. A special feature connected with the tool-room of a large establishment should be the banding and custody of the "checks." A correspondent of the *American Mechanic*, in speaking of the use of checks, says: "Don't let the men have them to get lost or mislaid, but keep them hung upon a board in the tool room. This will be found to save time and trouble, and will always enable the tool-room keeper to know at a glance how many articles a man has out."

"But you may say that if the men don't carry the checks they have nothing to show against the statements of the tool-room keeper. The same objection could be urged against the conduct of every public library in the country. If the tool-room man is not honest, he does not belong to any system that I care to talk about. But with an honest and careful man in the tool room to take care of the checks, you will have less trouble than if they are scattered among 40 workmen, most of whom are honest and some of them careful. While five checks would be enough for most men, some others would need ten, and two or more classes would thus be formed. Instead of counting the checks as they hang upon the pins where they belong, a notched gauge applied to the side will indicate any deficiency."

**CASTOR OIL TO PREVENT FOAMING.**—A correspondent of the *American Mechanic* writes as follows: "I have been troubled very much with the foaming of the water in boilers, especially when taken from creeks and pools. I have tried many ways to remedy the evil, but all the remedies that I could think of and read of failed me at times; but I have found one of late that has proven the best of all. Several months ago I was having trouble with the water, so much so that I could not run the engine. The foreman of the mill said he had used castor oil in a boiler where alkali water was used, and that he thought this would help us out of the trouble. So I put two ounces of the oil in at the check valve, and in three minutes the water was still and clear. So when foaming began again I began with the oil. Generally two ounces would last a day, but at times I would have to use a pint. My plan of banding boilers is to blow out some of the water at night or morning with about 50 pounds of steam, and put the oil in, if foaming begins after starting the engine. I never h'ow all the water out of a boiler, when hot, if I can avoid it. This boiler is tubular, 44-inch diameter, 14 feet long, and carries from 100 to 120 pounds of steam. Engine 12x20; 190 revolutions."

**A BOILER ILLUMINATED BY ELECTRICITY.**—At the late London exposition of inventions there was shown a working steam boiler, the interior of which was illuminated by electricity. The whole apparatus used for this purpose con-

sists of a little battery outside of the boiler, which is connected with incandescent lights screwed to the interior walls of the steam space above the water level and encased in steam-tight bulbs, while a second wire ends in a leading button outside of the boiler. Strong, double observing glasses are let into a brass rim set into the end wall of the boiler. If the current is closed by pressing the button against the metallic boiler wall, then the incandescent lamps begin to glow and light the interior of the boiler. It is hoped by this means of observing the process of heating water and the production and withdrawal of steam to gain material knowledge and advantages for steam.

**RESISTANCE IN TUBE PLATES OF BOILER TUBES WITH TAPER ENDS.**—In the minutes of the proceedings of the British Institution of Civil Engineers, there is an interesting record of some experiments which were made in Germany some time ago, with the object of testing the resistance of boiler tubes with taper ends forced into the tube plates. Five wrought-iron tubes were supplied for the purpose, which were forced into wrought-iron plates, bolted to and closing up the ends of a cast-iron pipe. Each tube was strengthened at both ends by a ring brazed on and turned taper on the outside, so that the outer surfaces of the two rings on each tube formed part of the same cone. The joints were made tight against an internal pressure of 15 atmospheres by means of a tube expander. In the first series of experiments the projecting ends of the tubes were not enlarged; in the second they were. The prepared test-piece was placed in the Werder machine in such a manner that at one end pressure was applied to the cast-iron pipe, at the other to the wrought-iron tube. With ends not enlarged, the mean force required to push out the tubes was 15,211.7 pounds; the maximum, 18,739.1 pounds; with enlarged ends the mean resistance was 20,943.7 pounds, showing an increase of 37 per cent. The outside diameter of the smaller end of the tubes tested was about 3.05 inches; this was measured on the taper ring. The diameter and thickness of the actual tubes themselves are not stated.

**PERFORATED IRON MASTS.**—It is curious that naval architects should have been so far at sea about perforated iron masts in ships. It appears that the English sailing-ship *Ethelstan* had a cargo of coal on board, and spontaneous combustion having taken place, all the efforts of the crew were unavailing to save her from destruction. But it surprised the master and chief mate greatly to see flames issuing from the heads of the fore and main masts when the conflagration was still confined below deck. The masts, being made of iron, were, of course, unflammable, but the apparent mystery was easily explainable. The lower masts were not only hollow, but had a number of perforations below deck for ventilating purposes. Consequently, when the cargo took fire the heated air rushed up these tubes, causing almost as thorough a draft as the chimney of a furnace, and with the air went, no doubt, a considerable volume of ignited gas. Thus, in the very endeavor to guard against spontaneous combustion by improving the ventilation of the hold, our maritime architects have created a new peril. Now, however, that their ingenuity will, no doubt, prove equal to the occasion.

**METAL LACE, ETC.**—It is not very long ago when it was proposed to make silver lace, not by working with metallic threads, but by giving pieces of ordinary lace an electro-plate bath. Since then all sorts of attempts have been made to utilize metal for clothing purposes. We have had metal hat-shapes, iron enameled collars, and even iron shirts perforated for ventilation, and so thin as to be perfectly pliable. The idea of making metal lace has been revived, but we doubt very much whether the notion will ever come to anything. Lace, to be worth wearing at all, should be hand-made. Metal lace would probably be very cheap, but to wear such a thing would be almost a sacrilege in the eyes of people who appreciate the beauties of the genuine article.

**PRECAUTIONS REGARDING THE USE OF BARBIT METAL.**—The *Age of Steel* cautions its readers against filling a box with barbit metal without first washing the box with alcohol and dusting over the surface with sal ammoniac. Whenever a tinned surface is formed, cover the remaining surface of the box with clay wash to protect it against the attack of the fused metal. To solder a joint that is to be carefully united, the surfaces must be nicely fitted with a file and then cleaned thoroughly before bringing the parts together. A piece of tin foil will occupy a small space and cover the whole surface, and when the work is heated slowly in a fire, the parts can be united so nicely that the joint will be almost invisible.

**AMERICAN "CUTENESS."**—A firm of English tool-makers, in a communication to the *English Mechanic and World of Science*, speak of what they call the "excessive cuteness for minute details" of American builders. This a contemporary regards as a very good joke, the point of which will be seen at once by a comparison between American and English machine tools. Nothing is more certain than that this same "excessive cuteness" is largely responsible for the fact that many American tools are used in England and on the continent.

## SCIENTIFIC PROGRESS.

## What We Know About Meteors.

From an exhaustive study of the very large collection of meteorites at Harvard college, the conclusion has been arrived at that many of the masses of meteoric iron now known are cleavage crystals, broken off, probably, by the impact of the mass against the atmosphere. It is found that these masses show cleavages parallel to the planes of all the three fundamental forms of the isometric or regular system; the Widmanstätten figures and Neumann lines are sections of planes of crystalline growth parallel to the same three fundamental forms of the isometric system, and, on different sections of meteorites, Widmanstätten figures and Neumann lines can be exhibited in every degree, with no break where a natural line of division can be drawn. The features of the Widmanstätten figures are due to the elimination of incompatible material during the process of crystallization, and the results of this investigation confirm the theory that the process of crystallization must have been very slow. From all that appears, the theory has come to be entertained, in respect to the origin of meteorites, that some of these masses were thrown off possibly from suns among the fixed stars, and that they were slowly cooled while revolving in a zone of intense heat.

Nature has summed up what we know about meteors as follows:

1. The luminous meteor tracks are in the upper part of the earth's atmosphere. Few, if any, appear at a height greater than 100 miles and few are seen below a height 30 miles from the earth's surface, except in rare cases where stones and irons fall to the ground. All these meteor tracks are caused by bodies which come into the air from without.

2. The velocities of the meteors in the air are comparable with that of the earth in its orbit about the sun. It is not easy to determine the exact values of these velocities, yet they may be roughly stated as from 50 to 250 times the velocity of sound in the air, or of a cannon-ball.

3. It is a necessary consequence of these velocities that the meteors move about the sun, and not about the earth as the controlling body.

4. There are four comets related to four periodic star showers that come on the dates April 27th, August 10th, November 14th and November 27th. The meteoroids which have given us any of these star showers constitute a group, each individual of which moves in a path which is like that of the corresponding comet. The bodies are, however, now too far from one another to influence appreciably each other's motions.

5. The ordinary shooting stars in their appearance and phenomena do not differ essentially from the individuals in star showers.

6. The meteorites of different falls differ from one another in their chemical composition, in their mineral forms, and in their tenacity. Yet through all these differences they have peculiar common properties which distinguish them entirely from all terrestrial rocks.

7. The most delicate researches have failed to detect any trace of organic life in meteorites. These propositions have practically universal acceptance among scientific men.

**CURIOSITIES OF MAGNETISM.**—Most well-informed people are doubtless aware, remarks a contemporary, that the globe on which they live is a great ball of magnetism, but comparatively few have an adequate idea of the influence this property is continually exerting on all sides; that many common but inexplicable phenomena can be traced directly to this source. Statistics go to show that in the matter of steel rails, as many as 13 will become crystallized and break where they go to make up a railroad track running east and west, before one of those on a north and south track is similarly affected. This is entirely due to the magnetism generated by friction, and the fact that the polarity of the magnetic current is in the former instance resisted in the headlong rush of the train, whereas in the latter case it is undisturbed. Another strange effect of this peculiar and occult force is that exerted on the watches of trainmen. A timepiece carried by the conductor or running a train 20 miles an hour, however accurate it may be, will, if the speed of the train is increased to say 50 miles, become useless until regulated. The magnetism generated by the flight of a train may be said to be in proportion to the speed with which it is propelled, and the delicate parts of a watch, numbering all the way from 400 to 1000 pieces, and peculiarly susceptible to this influence by reason of the hammering and polishing they have received, are not slow to feel the effect.—*Boston Jour. of Com.*

**CLIFF DWELLINGS IN MOROCCO.**—Recent discoveries have shown that cliff dwellings are found in great numbers in Morocco, which are now, and probably have been, inhabited from the time of their first construction. These dwellings in all particulars are like those found in Arizona and New Mexico on this continent. A New York paper speaks of them as follows: "It was not until last year that the Moore would permit any examination of the cliff dwellings which have long been known to exist some days' journey southwest of the City of Morocco.

The strange city of the cave-dwellers is almost exactly like some of those in New Mexico and other Territories which archaeologists have explored. The dwellings were dug out of the solid rock, and many of them are over 200 feet above the bottom of the valley. The face of the cliff is in places perpendicular, and it is believed that the troglodytes could have reached their dwellings only with the aid of rope-ladders. Some of the dwellings contain three rooms, the largest of which is about 17 feet by 9 feet, and the walls of the larger rooms are generally pierced by windows. Nothing is known as to who these cave-dwellers are.

**IN THE FAR-OFF FUTURE.**—Will the loss of speed in planets and comets cause them eventually to come to a stop? *Nature* asks: "Is the motion of planetary bodies perpetual? At first everything seems to show that it is. The earth, which, with its mass of three thousand trillion tons, turns with a speed which enables a student to go hare-headed a good many miles without catching cold in the act of saluting a professor, for a long time defied all attempts to detect in it loss of speed, but with the friction of the tides continually at work such loss must take place, and now it is pretty certain from the calculations of Adams, the astronomer, that the earth loses about an hour in 17,000 years, and is coming to rest rather leisurely. So, also, the hurrying up of the comets as they go round the sun is possibly accounted for by a retarding action in space which makes it necessary for them to try and make up, as it were, for lost time; and, in fact, the general arguments in the present day are in favor of what Sir Isaac Newton believed—that the motions of all bodies in space are suffering retardation, and that their velocity is becoming less and will ultimately cease."

**THEORY AND PRACTICE.**—If the theory of the "theoretical" man is a true theory, and if the practice of the "practical" man is correct practice, then the theory and the practice will fit each other line for line and dot for dot. The practical man becomes a theoretical man when he begins to give his reasons for doing as he does. If a man learns those laws of nature which relate to mechanics from hooks or lectures and then applies these laws to practice and makes no mistake in their application, he comes squarely face to face with the man who begins at the "practical" end and works up till he learns the same laws. They start at opposite ends of the same path, but both "get there all the same."—*Ex.*

**DELICATE INSTRUMENTS.**—In a very sensitive micro-radiometer described by Prof. Webber to the Helvetic Society of Sciences, the expansion of a tube of air presses a solution of zinc-sulphate toward the opposite side of a Wheatstone bridge, giving a great difference of electrical resistance. The radiation of the moon oscillates the galvanometer needle about five divisions. The microphone, another very delicate instrument, for magnifying sounds, has been so delicately constructed that the otherwise imperceptible noise made by drawing a hair across some part of it resembles the harsh grating of a saw, and the footsteps of a fly may be distinctly heard.

**A LIGHTNING-PROOF CHIMNEY.**—Lightning often plays sad havoc with tall structures in Germany. In order to avoid such accidents, a chimney has recently been constructed in Breslau, Germany, entirely of solid blocks of copper firmly compressed together, the blocks being placed carefully one on the top of the other and joined together with a special cement. The chimney is non-inflammable, and, by the nature of the material, quite secure from lightning.

**THE FINEST FIBERS.**—The nettle is among the substances which science has put to use during the past few years. This weed is even being cultivated in Germany, its fiber having proved valuable for a variety of textile fabrics. In Dresden a thread is produced from it so fine that a length of 60 miles weighs only 2½ pounds. The pineapple produces a still finer fiber, a shawl made of which, owned by Queen Victoria, cost 1000 guineas.

**FROZEN MILK.**—When milk is slowly and partially frozen the ice takes up the greater part of the cream; the unfrozen remainder contains the casein, milk, sugar, and salts, but, in consequence of its loss of cream, appears like diluted milk, and would be described as such if merely tested by the ordinary lactometric instrument. Milk which has been frozen should therefore be well thawed and shaken up, and not sold while any ice is visible.

**RULE FOR ESTIMATING THE FORCE EXERTED BY A SPIRAL SPRING.**—One of the rules for spiral springs, when made of round steel, is to multiply the cube of the diameter of the steel wire in inches by the amount that it is to be deflected for each coil, and this product by 75,000, then divide by the diameter of the spring, measuring from the center of the wire, and the quotient will be the force exerted in pounds.

**THE BLUE OF THE SKY.**—Prof. Tyndall has decided that the sky is blue but the blue is not pure. He says: "On looking at the sky through a spectroscopic we observe all the colors of the spectrum; blue is merely the predominant color."

# GOOD HEALTH.

## Snow-blindness and "Boot-leg Goggles."

EDITORS PRESS:—Snow-blindness is an affliction which results from the rays of the sun being reflected from a surface of snow into the eyes. It is not only painful; it frequently results in permanent injury. The eyes continue sensitive to exposure, and the tendency to close them when looking at bright objects indicates the serious nature of snow-blindness. My experience may prove serviceable if it saves others from this misfortune, and I will briefly state the facts. While living on my ranch in Colorado one of my cows was found in an irritating ditch, where the ditch had been cut through a ridge. This cut was partly filled with drifted snow. The storm was over, and as it was in March the sun was shining brightly. To enable this cow to get out it was necessary to shovel a path in to her and also toward the sun. The plan succeeded, and the cow was liberated, but that night my eyes felt as if red pepper had been rubbed on them. If I closed them the tears would pour out and wet my cheeks. I was so blind that I could scarcely recognize my animals by daylight; ordinary exposure to sunlight was very painful.

This state of affairs compelled me to study out a remedy. After trying several expedients to shut out the light, I adopted another plan. I cut from a boot-leg a piece of leather having two ovals to fit each eye, leaving a strip to connect them and rest on the nose. The leather was soaked in water, and then each eye-piece was hammered into an iron spoon, making them convex. When they were dry a narrow slit was cut lengthwise in each of these rounded eye-pieces, and a buckskin thong fastened at each end to allow the whole to pass over the head. This contrivance cut off the reflected rays and enabled me to look out freely when the strongest sunlight was reflected from a field of snow. The goggles fitted close without inconvenience to the eyes, and could be placed in the pocket if desired.

Afterward I saved a member of a surveying party from snow-blindness by giving him a pair of boot-leg goggles, and enabled him to go on with his work. The greatest danger from this cause is in the spring, when the sun's rays have gained intensity. As some of your readers may be interested, and most American boys can make the goggles, my experience may possibly result in their benefit.

EDWARD E. CHEVER.

San Francisco, March 1, 1888.

## How to Treat the Eye With a Cinder in It.

R. W. St. Clair writes the *Medical Summary* as follows: "Nine persons out of ten with a cinder or any foreign substance in the eye will instantly begin to rub the eye with one hand, while hunting for their handkerchief with the other. They may, and sometimes do, remove the offending cinder; but more frequently they rub until the eye becomes inflamed, hind a handkerchief around the head, and go to bed. This is all wrong. The better way is not to rub the eye with the cinder in at all, but rub the other eye as vigorously as you like.

"A few years since I was riding on an engine. The engineer threw open the front window, and I caught a cinder that gave me the most excruciating pain. I began to rub the eye with both hands. 'Let your eye alone, and rub the other eye' (this from the engineer). 'I know you doctors think you know it all; but if you will let that eye alone and rub the other one, the cinder will be out in two minutes,' persisted the engineer. I began to rub the other eye, and soon I felt the cinder down near the inner canthus, and made ready to take it out. 'Let it alone, and keep at the well eye,' shouted the doctor pro tem. I did so for a minute longer, and, looking in a small glass he gave me, I found the offender on my cheek. Since then I have tried it many times, and have advised many others, and I have never known it to fail in one instance (unless it was as sharp as a piece of steel, or something that cut into the ball, and required an operation to remove it). Why it is so, I do not know; but that it is so, I do know, and that one may be saved much suffering if he will let the injured eye alone and rub the well eye."

LABOR AND RECREATION.—Recreation is intended to the mind as whetting is to the scythe, to sharpen the edge of it, which otherwise would grow old and blunt. He, therefore, that spends his whole time in recreation is ever whetting, never mowing. His grass may grow and his steel starve; as, contrarily, he that always toils and never recreates is ever mowing, never whetting, laboring much to little purpose. As good no scythe as no edge. Then only doth the work go forward when the scythe is so seasonably and moderately whetted that it may cut and so cut that it may have the help of sharpening.

BEEFSTEAK WORTHLESS FOR A BLACK EYE.—There is a world-wide superstition, says the *Chicago Journal*, that as soon as a man gets a black eye he must use cold applications for hours, and that the best cold application possible is raw beef. I call it a superstition because it is without reason and against reason. Everybody knows that what makes a discoloration

of the skin by a bruise is the congestion of the part with the blood that cannot get away again, so that it decomposes and changes its color; and everybody ought to know that the way to prevent such a result is to facilitate and stimulate the circulation in the bruised part. A cold application retards the circulation, and the best thing to stimulate it is hot applications. Twice in my life I was threatened with a black eye. On the first occasion I applied raw beef and other cold applications and succeeded in producing the blackest eye I ever saw. On the second occasion I got some hot water right away and bathed the eye for about half an hour in it. The result was that there was not the slightest discoloration visible at any time. These hints are well worth pasting in the hats of some people in Chicago.

THE CLOSE OF LIFE.—It is a great mistake to suppose that the usefulness of life ceases with the power of active service. When the tired hands are folded in the repose which their toil has rightly earned for them, when the weary brain is relieved from the burden of cares and perplexities which it has nobly borne, there should be a season rich in blessings and in influence which no one would willingly forego. Then should come the leisure vainly longed for in past years, and the opportunity to attend to many things and to enjoy much that was before impossible. If the busy life has also been an honorable one, there are sweet memories, cherished friendships, the devotion of children, the respect of society, the power of helping others through the accumulated experience and intelligence of many years. The very presence of a venerable and beloved face is a blessing to those who look upon it, bringing suggestions of well-earned peace and calm to the busy toiler, and calling up emotions of tender reverence in the eager and buoyant youth.

CATARH AND HAY FEVER.—The microscope has proved that these diseases are due to the presence of living parasites in the lining membrane of the upper air passages and eustachian tubes. The eminent scientists, Tyndall, Huxley and Beale, indorse this, and these authorities cannot be disputed. The regular method of treating these diseases has been to apply an irritant remedy weekly and even daily, thus keeping the delicate membrane in a constant state of irritation, allowing it no chance to heal, and as a natural consequence, very few permanent cures are recorded. In any treatment of these diseases, the treatment, if in any way caustic, applications should be made at infrequent intervals, so that the membranes may have a chance to recover from any violence that may have been used in the previous application.

## USEFUL INFORMATION.

SUBSTITUTES FOR TURPENTINE AND BOILER OIL.—Among recent coal-tar products is an article made by an English firm, S. Banner & Co., of Liverpool, from a combination of hydrocarbons having a similar composition to that of ordinary turpentine. As it has been found to act quite as well as, and is much less costly than, turpentine, it will no doubt be very valuable in the arts and manufactures. It is already, we understand, being largely used in this country and abroad, its excellence being such that it is quite impossible to distinguish the work done by it from that produced by ordinary turpentine even in carriage painting and varnishing. Another new product of interest to the paint trade is boiled oil, which is composed partly of hydrocarbons. It is similar in odor and appearance to boiled linseed oil, and differs from most other oils intended to replace linseed oil in two important characteristics, viz., that it will dry perfectly in a comparatively short time and leave the face of the paint as smooth and hard as enamel.

THE USE OF A GOOD MATERIAL THE BEST ECONOMY.—That economy lies in the use of a good material, and not in cheap stuff, says the *Master Mechanic*, was well illustrated on one of the large Ohio roads recently. The newly appointed superintendent of motive-power found that the valve oil used on the road was a mixture of black oil and tallow, the total cost of which was 32 cents per gallon, and that the average mileage per quart was 100 miles. He also found that one valve seat was being faced every day in the shops. A change was made to valve oil costing 50 cents per gallon. This is giving an average mileage of over 200 miles per quart, and it has been necessary to face only five valve seats in four months.

ZINC AS A FIRE EXTINGUISHER.—Zinc, placed upon the fire in stove or grate, is said to have proved itself an effective extinguisher of chimney fires. To a member of the Boston Fire Department is reported to be due the credit of successfully introducing this simple scheme. When a fire starts inside a chimney, from whatever cause, a piece of thin sheet zinc, about four inches square, is merely put into the stove or grate connecting with the chimney. The zinc fuses and liberates acidulous fumes, which, passing up the flue, are said to almost instantly put out whatever fire may be there. It certainly sounds simple enough.

AN ABSOLUTE NON-CONDUCTOR.—A correspondent of the *Globe-Democrat* says: A absolute non-conductor, insensible alike to heat or cold and absolutely fire-proof, has at last been discovered in pulverized paper. I tried this discovery last winter by packing the drain and water pipe of my residence with it, and all the pipes are on the outside of the building, and the season was the severest of many years. My plumbing did not cost me 25 cents. As a covering for steam pipes, it acts equally as well. Pulverized paper, I repeat, is an absolute non-conductor.

THE SECRET OF PAINTING CHINA WARE.—Jonny June, in the *American Magazine* for February, says that the present manufacture of porcelain is a comparatively recent industry, and is constantly reaching fresh results. The underglaze treatment of china, for example, was not known here 25 years ago; it was a secret guarded most carefully, and confined to a few European and Eastern factories and workers. It was a girl who discovered it—Miss McLaughlin—and now it has become the property of all expert china decorators. Her success was not alone important to china-painting as an art; it was specially valuable in raising the estimate put upon the work of her own sex, and has perhaps done more than ought else to stimulate to good results the work of women in this branch of industrial art.

AFRICAN TEAKWOOD INDESTRUCTIBLE.—The interesting fact has been stated that so indestructible by wear or decay is the African teakwood that vessels built of it have lasted 100 years, to be then only broken up on account of their poor sailing qualities from faulty models. The wood, in fact, is one of the most remarkable known on account of its very great weight, hardness and durability, its weight varying from 42 to 52 pounds per cubic foot. It works easily, but on account of the large quantity of silex contained in it the tools employed are quickly worn away. It also contains an oil which prevents spikes and other iron work with which it may come in contact from rusting.

POTATO FLOUR.—Potato flour is extensively manufactured in Germany. It is used by sausage-makers, bakers, confectioners and cooks for powdering purposes. Weaving establishments use it to give their goods a glossy appearance and to size the threads in the wool. It is also used in the manufacture of starch, potato sugar and white syrup. In France drying potatoes is quite an industry. The potatoes are pared, sliced, and placed in brins for a short time, then placed in a drying-room of 200 degrees until dried. This farina is used in several manufacturing processes.

THE SAND-BLAST FOR CLEANING WALLS, ETC. Amateurs adopt new ways and improved methods more readily than your skilled workman. As occasion offers, let amateurs try this sand blast for cleaning old stained and dingy stone walls or buildings instead of using wire brushes. Also for cleaning rust from iron and eand from castings without scraping. Possibly the sand-blast may answer for cleaning floors, stairs, interior walls, ceilings, etc., without washing or scrubbing. No patent on these adaptations of this sand-blast.

TO RENOVATE PICTURE FRAMES.—To renovate and brighten the gilt frames of pictures and mirrors that have become dirty and dingy, simply wash very gently with a small sponge moistened with spirits of wine or oil of turpentine, the sponge only to be sufficiently wet to take off the dirt and fly-marks. The frames should not be wiped afterward, but left to dry of themselves.

TO PREVENT MOISTURE IN SALT.—To prevent salt from becoming moist and caking so as not to sift freely from the cellars, a house-keeper recommends the use of a little cornstarch with the salt; a saltspoonful of cornstarch to about two salt-cellars of salt. The starch absorbs the dampness and the salt sifts more easily.

TO REMOVE GREASE.—Aqua ammonia, two ounces; soft water, one quart; saltpeter, one teaspoonful; shaving-soap in shavings, one ounce; mix all together; dissolve the soap well, and any grease or dirt that cannot be removed with this preparation is a hopeless case.

A HINT FOR THE COOK.—To test cake in the oven never insert a broom splinter, but draw it gently forward and put the ear close to the loaf; if it he not done there will be a little sputtering sound. When it is thoroughly baked there will be no sound.

TARNISHING SILVER.—Nothing tarnishes silver more quickly than rubber, the ring around the neck of a fruit-jar being enough to color a whole closetful of silver in one night. A lump of gum camphor in a closet will do much to protect the goods.

LEAD CASTING.—Pure lead does not run smooth in any casting with any kind of mold. But if it is alloyed with tin and bismuth, it will run quite smooth and melt at a much lower temperature.

NON FLAMMABLE TISSUES.—The lightest tissues can be rendered unflammable by dipping them in a solution of phosphate of ammonia in water. It will be found impossible to set the fabric so treated on fire.

## Mexican Mines.

An official report on the mines of Vera Cruz states that coal deposits are found in a parallel line of equal length (150 miles) running through the western canyons at a level of 2000 to 4000 feet above the sea. The existing roads are inadequate to the development of these coal-fields. The coal is found near the surface, and the lower seams could be easily worked.

The coal and petroleum mines in the State of Vera Cruz, so far as extent is concerned, are the most important as yet discovered.

The Wells-Fargo Express Co. exported from Mexico, in December last, silver hulsion, coined silver and gold valued at \$764,564. In January the hulsion and coin exported by the company was valued at \$588,014.

The private commercial agency of Mexico in London reports to the Government that the following companies have been organized in the United Kingdom during the year 1887 to work gold, silver and copper mines in Mexico:

	Capital.
Bytopias Mining Company	£40,000
Bravo Mine Syndicate	15,000
El Gale mines	20,000
La Luz mines	210,000
London Mexican Prospecting and Finance Co.	25,000
Mansfield Mexican silver mine	100,000
Mexican copper mine	250,000
Mexican Santa Barbara	300,000
Oaxaca Mining Co.	100,000
San Acacio Mining and Freehold State Co.	400,000
Shedding Co. of Mexico	100,000
South Mexican Gold and Silver Mines Co.	180,000
Westminster Catorce Syndicate	2,800
Zacatecas Gold Mine Co.	10,000

Total ..... £2,135,500

According to a recent official report, Mexico's output of gold and silver for the past ten years is summed up as follows:

Years.	Gold.	SP. per.	Total.
1877-78	\$747,000	\$24,837,000	\$22,684,000
1878-79	831,000	25,125,000	26,666,000
1879-80	912,000	26,809,000	27,742,000
1880-81	1,013,000	28,234,000	29,247,000
1881-82	937,000	29,300,000	30,236,000
1882-83	950,000	29,569,000	30,525,000
1883-84	1,055,000	31,605,000	32,760,000
1884-85	914,000	33,226,000	34,140,000
1885-86	1,026,000	34,112,000	35,138,000
1886-87	1,047,000	34,600,000	35,647,000

Totals ..... \$5,518,000 \$208,627,000 \$208,645,000

During the last fiscal year \$410,000 in gold and \$25,600,000 in silver were coined in the Mexican Republic, and \$8,045,749 in gold, \$323,883,608 in silver and \$203,296 in copper in the last 14 years.

## Product of Comstock Mines.

The statement of the assessor of Storey county, Nev., showing the ore and hulsion production of the mines of the Comstock lode for the quarter ended December 31, 1887, and just filed, contains some interesting figures relating to the cost of mining and milling in that district. We extract the following items:

Consolidated California and Virginia produced 38,940 tons of ore, which yielded hulsion valued at \$739,661.83; cost of extraction, \$276,898.58; transportation and reduction, \$272,580.50; total cost, \$549,478.58; net yield, \$190,183.30; average yield per ton, \$19.

Hale and Norcross produced 1594 tons of ore, the total hulsion product from which was \$45,666.33; cost of extraction, \$18,726.83; transportation and reduction, \$8818.56; total cost, \$27,546.39; net yield, \$18,120.94; average yield per ton, \$28.59.

Savage produced 5445 tons of ore, the gross hulsion yield of which was \$113,404.45; cost of extraction, \$62,579.18; transportation and reduction, \$40,460; total cost, \$102,039.18; net yield, \$10,365.24; average yield per ton, \$20.83.

Chollar produced 1700 tons of ore, which yielded hulsion valued at \$27,144.87; cost of extraction, \$29,857.38; transportation and reduction, \$11,900; total cost, \$41,757.37; excess of cost of production above yield, \$14,632.50; hulsion yield per ton, \$15.97.

Yellow Jacket produced 24 828 tons of ore, which yielded hulsion valued at \$196,441.64; cost of extraction, \$121,922.56; transportation and reduction, \$186,220; total cost, \$308,143.27; excess of cost of production above yield, \$111,701.63; average hulsion yield per ton, \$7.91.

Kentuck produced 1656 tons of ore, which yielded hulsion valued at \$23,190.65; cost of extraction, \$13,683.70; transportation and reduction, \$10,104.60; total cost, \$23,788.30; excess of cost of production above hulsion yield, \$597.65; average hulsion yield per ton, \$14.

The total product of the lode for the quarter is \$1,145,509, against \$584,614 for the quarter ending September 30, 1887. It is estimated that the total yield of the lode for the current quarter ending March 31st will exceed \$2,000,000.

VERDICT FOR THE MINER.—A jury in Judge Levy's court has rendered a verdict of \$1000 for the plaintiff in the case of John Smith against the Black Diamond Mining Co. of Contra Costa county. The suit was brought by Smith to recover \$10,000 damages for injuries received while at work in the mine.

The Quinn, Sutro, Niagara, Liverpool, North Comstock, Succor, Mohabao and Contenton Mining Companies have been stricken from the list of the San Francisco Stock Exchange for the non-payment of the annual dues.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

### CALIFORNIA.

#### Amador.

**PLYMOUTH.**—Cor. Amador Ledger, March 10: A descent was made into the Pacific mine on Friday last, and the part of the mine that had been burning was thought to be free from fire, and much satisfaction was expressed at the condition of the mine, but unfortunately in a short time after the examination had been made the fire broke out in a new place, and the smoke drove the men out of the mine. The shaft is covered over again, and we hear that the managers are waiting for orders from headquarters as to what will be the next move. We hear a great deal of talk about flooding the mine with water, and that the preliminary steps have been taken to conduct the water to the mouth of the shaft. It is rumored that the owners of the mine will be on the ground shortly, when some heroic efforts will be inaugurated to put out the fire. It is reported that a ledge of quartz has been struck in the New London mine, 14 feet wide, and of high grade. The New Chicago has started sinking again, and will sink another 100 feet. The ore from the mine shows considerable free gold, and is well filled with sulphurets. The War Eagle Co. is cleaning up. We hear that the owners are well satisfied with the results. Mr. Edlog is still crosscutting in his claim. He finds some very nice-looking quartz that is full of sulphurets and prospects pretty well in free gold when worked in a mortar. Bowden is still blasting his way toward the ledge in his claim. The tunnel is in over 400 feet.

**AMADOR CITY.**—Cor. Amador Ledger, March 10: The mines and mills are all running steadily. At the Bunker Hill mill they now have 16 of the Frue concentrators, 12 of which are in good working order, and the other four will be ready in a few days. If the report is correct they are taking out some very rich rock from the tunnel near the mill. Sinking was commenced at the Keystone north shaft last week, but was stopped again after three days' work. The superintendent went down to the city for a few days, and on his return operations in the shaft ceased. A slight change has been made at this mine in regard to the miners coming to the surface to eat their dinner. They now have to eat their dinner in the mine, so that they are under ground from seven in the morning till six at night. The air compressor at the South Spring Hill mill has been moved to the planing-mill, where it will be placed by the side of another one of the same size. The pipes that convey the air to the mine are about all laid, and they expect to have the compressors running some time next week. The water in the Talisman shaft is below the 500-foot level. There are several men at work repairing the shaft and the 400-foot station.

**SUTTER CREEK.**—Cor. Amador Ledger, March 10: Nearly all of the victims of the late fire are already at work rebuilding. Hammer and saw can be heard almost all over the business part of Main street. Our mines are all looking well and running regularly. At the Wildman mine they are preparing for the additional ten stamps, and Knight & Co. are busy getting out the mortars and other castings. In a month or six weeks they are in hopes of having the stamps in operation. The four men who have leased the Lincoln mine are running 20 stamps. The rock that is being taken out is of good quality, and the mill is looking well. There are good prospects of the Mahoney mine starting in good shape in the spring.

**DRYTOWN.**—Considerable prospecting has been done on the mineral belt between the Gover mine and Plymouth. A new claim known as the Minnie Moore mine, situated about three-quarters of a mile northwest of the Cosmopolitan, and one mile south of the New London, is being worked by Messrs. J. Mayden, John Bulowski, and Robert Waddell, who have sunk a shaft about 25 feet. A three-foot ledge was struck, showing a flattering prospect. The Gover is running a full force of men, and everything about the mine looks encouraging. Raymond Brees succeeds Mr. Waters as foreman of the Gover mill.

#### El Dorado.

**GOLD DUST.**—Georgetown Gazette, March 10: Our miners are busy and the sale of gold dust in town is increasing.

**JOSEPHINE.**—Every one who has visited the Josephine mine since the 20-stamp mill was completed says it is the best equipped mine on the divide. This mine had been idle for several years before the present company took hold of it, but under the present management it has proved to be a very valuable property. There are other mines here on which failures have been made that will prove equally valuable when they fall into the right hands.

#### Napa.

**QUICKSILVER SHIPMENTS.**—Calistogan, March 10: During February, quicksilver from the mines here mentioned was shipped from Calistoga to San Francisco as follows: Great Western (flasks), 64; Bradford, 187; Sulphur Bank, 135; Napa Con., 273; total flasks, 659, or 49,932 pounds, which amount is very good for a short month.

#### Nevada.

**NORTH BLOOMFIELD.**—Nevada Herald, March 7: Two or three weeks ago matters looked very blue at North Bloomfield. The croakers thought the town was gone in, and people commenced to cast their eyes around for a good place to emigrate to. The shutting down of the Derbec seemed to be the last feather to break the camel's back. But things have suddenly changed. The Derbec is at work full-handed and other mines there will work. There is the richest gravel belt in the State surrounding North Bloomfield and much of it will pay to drift. It will be drifted and Bloomfield will be a good town after many of its residents have gone to the happy hunting-grounds.

**STRUCK IT RICH.**—Grass Valley Union, March 10: Cunningham & Co., who have been having good pay gravel in their claim near Randolph Flat for some time past, have found it quite rich within the last few days in extending their drift. One pan of dirt yielded \$11.25, the largest piece in this yield being about the value of \$3. A number of other panfuls yielded almost as much per pan. The finding of such rich gravel will prove a great stimulus to other prospecting operations going on in the vicinity on the same lead. Among the prominent locations on the ridge are the Holbrook & Harrington claim and the Baltic claim, both on the same channel.

**THE DELHI LOOMS UP.**—North San Juao Times, March 10: From and including February 1st to March 1st the cleanups at the Delhi mine aggregated, in gold bullion, the sum of \$32,700, from which the 13th dividend of \$10,000 was declared and paid on the 1st inst. The receipts at the mine for the latter day's work were \$12,500. If there is an 18-stamp mill on a mine in this State that can make a better or as good a showing, we want to hear from it. The Delhi has now paid 13 dividends of \$10,000 each. It has paid \$130,000 to its stockholders within the past 13 months, and from the looks of the rock in sight, better results may be anticipated for the year commencing on the 1st inst.

**A RICH MINE.**—Mr. Philbrick, one of the owners of the junction mine, situated at the junction of the North and Middle Yuba rivers, a few miles from North San Juan, informed us that a piece of rock taken from the said mine 30 feet below the surface was sent with some sulphurets to the Delhi mine to be assayed, with the following results: The rock assayed over \$650 to the ton; ore assay of sulphurets showed over \$1100 to the ton, and a second assay of sulphurets showed over \$1700 to the ton. The ledge below the water is over 15 feet in width, though the streak of rock which assays so enormously is not a foot in width. This ledge is owned by G. N. L. Powell, Fred Philbrick and Frank N. Morris.

**THE GRANT MINE.**—The stamps in the General Grant mine are still quiet. Just when they will start the mill to crushing has not yet been made known. That they have good-paying rock, there can be no doubt.

#### Placer.

**SPRING GARDEN.**—Placer Herald, March 10: Spring Garden and vicinity has always been an inviting field to the miner. The ravines were all rich, and in many places the hillsides have paid the prospector well for his labor. The backbone of the Divide separates Spring Garden from the well-known Owl creek and its tributaries, from which thousands of dollars were taken in the early days of mining. A deal of prospecting has been done in the Spring Garden ranch, but for some reason or other the gold-hunters failed to strike the channel. But though unsuccessful, their failure never weakened their faith in its existence. Many miners on the Divide still believe that the big "blue" lead is there, or near there, and that wealth awaits the man or the company that shall be so fortunate as to find it. All the indications strengthen this belief. Slopes have been sunk, and tunnels have been run, but the prospectors, so far, have not had the money to back their faith. The latest attempt is that of the Gray Eagle company, which is now sinking a shaft, half a mile above the ranch, on the top of the ridge. This shaft is down 220 feet in gravel and boulders. This depth indicates a channel, and if the quantity of water is not too great, the company will go down to bedrock and run drifts in various directions to test the depth and breadth of the deposit. This shaft is an experiment, and much depends upon the result. Should the experiment be successful, other companies will begin operations at once. The Gray Eagle company is doing the pioneer work, and is risking its capital in its attempt to develop this section. Should it not succeed, the further development of the mines would be arrested for years, capital would seek other fields and the existence of the channel would remain unproved.

**LIVE OAK.**—George Geissendorfer is opening up the old Live Oak quartz mine. He has sunk about 70 feet, and is very well satisfied with the indications. The ledge is 4 feet wide, and the rock, according to mining experts, is of the same kind as that in the Idaho mine, at Grass Valley. As soon as the roads are in condition he will haul several tons to mill. From samples we have seen, the rock will pay \$20 a ton, easy.

#### Plumas.

**LIGHT'S CANYON.**—Cor. Lassen Mail, March 10: The Engle Bros. in Light's canyon have a very large copper ledge, which, considering the market rates of copper, should attract the attention of capitalists. The ledge is about 50 feet wide, and is said to abound in profitable ore. The Crescent mine is still operating, and it affords employment for about 40 men. The Green Mountain is yet idle, and the indications are that it will be for an indefinite period. The Indian Valley mine near Greenville is not operating at present, for want of water for motive-power.

#### San Bernardino.

**HERCULES COPPER MINE.**—Colton Semi-Tropic, March 7: A few days since P. C. Garvey and W. McCombie of San Bernardino sold to a San Francisco firm the Hercules copper mine, located eight miles north of Goff station, which is about 200 miles east of this city, on the A. & P. road, and in San Bernardino county. The price is not stated, but it is understood that Garvey & McCombie got a round sum of money for the property. The ledge of the Hercules is from six to eight feet wide and carries ore that will work 33 per cent in copper. There was between 500 and 600 tons of ore on the dump when the mine was sold.

#### Shasta.

**LOWER SPRING MINES.**—Cor. Redding Free Press, March 10: Everything in the line of industry at Lower Springs is dormant, perhaps on account of the late storm and possibly from want of capital. The Miller mine has closed down, but will probably commence again soon. White of the Whiteoak mine has some fine specimens of ore. Penrose of the Eastern Star has commenced operations. Emery has struck some very rich ore in the extension to the Eastern Star. There are about 20 gold-bearing ledges in this belt running an easterly and westerly course. The mines are all poor and are waiting for capital to develop the value of mining property in this district.

#### Sierra.

**BALD.**—Mountain Messenger, March 10: The Bald Mountain Ex. Co. declared a dividend, No. 16, March 16th, of five cents a share, aggregating \$3000. A large crew of men are working and matters are prospering at the mine. The payroll for February was \$5132.25.

**ALLEGHANY.**—Cap. Bradbury came over from Alleghany, Wednesday and showed us an ounce of gold, the prospect obtained from the bedrock on the east rim of the deep channel at the bottom of the in-

cine of the California Co., on what is better known as the Typhoon and Nebraska ground. This is beyond a reasonable doubt the lava-capped lead extending from the Ruby, through the Extension and South Fork to the California. This insures a prosperous future for Alleghany.

**GOLD BLUFF.**—The yield of the Gold Bluff quartz ledge, owned by A. Vanslyke, near Dowoieville, for the past 32 days, was over \$9000. Only 14 men are working. This mine promises to eclipse the Young America.

#### Trinity District.

**A MINING SALE.**—Silver State, March 5: The Morning Star, West Star and California, in Trinity mining district, west of old Oreana, have been sold by J. T. Hauskins, S. R. Young and Antone Kaufmao, to Ansil Skidmore of New York, and associates. The purchase price, \$15,000, was paid here, and the deeds recorded yesterday. These mines adjoin the Evening Star mine, which in early days was worked to the water level and produced very rich ore. One of the mines is developed to a considerable extent and is considered valuable property. The purchasers will set men at work and build a mill on the property immediately.

#### Tuolumne.

**GROVELAND.**—Cor. Tuolumne Independent, March 10: Active work is going on in the celebrated Longfellow mine near Big Oak Flat. The hoisting machinery is on the ground and will soon be ready for work. If this does not prove to be a bonanza, then all signs fail. Work is still going on in the Belcher mine. The mill and engine are all ready for crushing as soon as the rock-breaker is set up. Fisk & Chrystal have put their mill, at Big Oak Flat, in good order, and will start up on rock from the Accident mine as soon as the weather will permit. John Cavanaugh is at work on the Red Jacket, taking out rock which he will crush at the Big Oak Flat steam mill. The rock prospects well and ought to pay handsomely. Winslow Hubbard has moved down to the river to resume operations on his two promising claims. Mr. Cruikshank is at the Mary Ellen mine, superintending some prospecting work, and is getting splendid prospect in his second tunnel. There is a rumor that the Mount Jefferson property will soon change hands, and the Rhode Island mine, adjoining it, is now under bond to the owner of the Mt. Jefferson, and is to be sold with it. A new shoot has been cut in tunnel No. 3 of the Kanaka mine. The shoot shows free gold and prospects well. Herbert Shaw discovered a new vein in the Equinotial mine last week, which shows lots of gold. There are now three veins in this claim, within 25 feet of each other, and as he is now sluicing off the hillside, more may be discovered when the top soil is removed.

**BONANZA.**—Sonora Democrat, March 10: Messrs. Oliver & Johnson of the Bonanza mine have a fine prospect, but the pouring in of water has stopped all manual operations and necessitated the application of a steam engine and pump. The portable engine heretofore used by Mr. Ferguson has been purchased, and it will soon be placed and in successful operation.

**HYDE.**—Mr. Hyde of the Hyde mine, ten miles above Sonora, says that the above mine is doing finely; that the lead is of good width and looks well. The mill is not running at present, owing to the rock-breaker becoming disabled. The foundry in Sonora will soon have a new one built and ready for operation.

**GRAVEL ENTERPRISE.**—Messrs. Graham & Seibert of Sonora have found some gravel in the neighborhood of the Phoenix reservoir and they are now actively engaged in preparing for systematic development. It will require considerable work before the extent of the gravel stratum can be determined, but from present appearances they have a fine prospect.

**SOULSBY.**—It is thought that the Soulsby mine will shortly commence operations. Parties who have a comprehensive knowledge of mining say that it is not near worked out and that its future will rival its past.

### NEVADA.

#### Washoe District.

**BELCHER.**—Virginia Enterprise, March 10: The 500 level east crosscut is in 123 feet, having been advanced 28 feet during the week. The ground shows considerable clay and a slight flow of water. The west crosscut is in 46 feet, having been advanced 22 feet during the week. The material in the face shows no particular change.

**HALE AND NORCROSS.**—This mine has produced \$35,000 during the month of February from ore reduced at the Vivian mill, which has only 16 stamps. Ore is now being shipped to the Mexican mill, and Monday the 20 additional stamps of the Chollar will be started on Norcross ore. It is proposed to push the milling of the ore in the future. In San Francisco the feeling is that this mine will be a dividend-payer within the next 60 days. The work in the mine the past week shows the extent of the ore body above the 700 level to be 280 feet long, so far as developed, with an average width of from 30 to 35 feet.

**GOULD AND CURRY.**—Are still extracting ore on the 250 and 300 levels, and have extracted during the week 55 tons of fair-grade milling ore, which is stored in the drifts in the mine. On the 1300 level the south drift from the east drift has been extended 48 feet; total length, 425 feet. This drift is within a few feet of the south line. When this line is reached two west crosscuts will be started. On the drain tunnel level from the main south drift near the south line have started two west crosscuts. These crosscuts are passing through the old west levels.

**BEST AND BELCHER.**—On the 425 level the main north drift has been extended 31 feet; total length, 600 feet. The formation is quartz showing value by assay. From No. 1 upraise, 70 feet above this level, the north drift has been extended 23 feet; total length, 34 feet. The formation is quartz. Opposite the north drift the south drift has been extended 20 feet; total length, 31 feet. The face of the drift is in porphyry. The upraise has been carried up 8 feet; total height, 78 feet. The top of the upraise is in quartz, showing value by assay.

**ALTA.**—Are sinking a new shaft, 250 feet east of the Keystone shaft on the Keystone vein, to meet an upraise from the 825 level. This will greatly facilitate the banding of ore and prospecting the mine at that point when completed. Now that the

freezing weather is over, work will soon again be resumed at the mill. The bins are all full of ore, and there is scarcely room left in the mine in which to stow it away.

**CHOLLAR AND POTOSI.**—Prospecting work is being vigorously pushed on the several levels of both mines above the 550 level. The ore reserves are yielding steadily, and the mill is running splendidly. Progress is reported in the several drifts, without any particular change to note. Twenty additional stamps will be started at the mill Sunday, and will run on Norcross ore.

**SAVAGE.**—During the month of February this mine produced \$80,000 from ore reduced at the Mexican mill. Shipments are now being made to the Vivian mill, and it is understood that the Rock Point mill will soon be busy reducing its ores. The week's work has been very satisfactory, and the mine could keep the largest mill on the lode running.

**HAYWOOD.**—There are 12 men engaged in the mine, 5 of whom are knocking down about 18 tons of ore per day, which is shipped and reduced at the Taylor mill. The ore comes mainly from below the tunnel level. Crosscutting for the hanging-wall 225 feet below the tunnel level is progressing fast.

**BALTIMORE.**—The developments on the 380 level are not yet sufficient to demonstrate the extent and value of the ore recently struck at that point. The machinery is working well and handles the water, though with some difficulty. It is believed that this water will give out.

**OEST.**—The Oest mine is being actively worked. The ore shipped and worked at the Briggs mill is very rich, and the owners of the mine have a veritable bonanza. The mining works are all nicely covered by a substantial building.

**CROWN POINT.**—No. 1 east crosscut is in 80 feet, having been advanced 17 feet during the week. The ground shows no material change. No. 2 east crosscut is in 123 feet. The face shows a small flow of water and considerable clay.

**UTAH.**—On the 472 level east crosscut No. 3, opposite west crosscut No. 2, has been extended 27 feet; total length, 90 feet. Have cut out a station and started an incline upraise from the end of this crosscut.

**IOWA.**—The retimbering, enlarging and track-laying on the 500 adit level has progressed favorably during the last week. Work will be resumed in the face of the tunnel by the 12th of the month.

**YELLOW JACKET.**—Shipping 125 tons daily to the Brunswick. It is extracted from the 1200, 1300 and 1400 levels. The machinery is all working well.

**ALPHA, IMPERIAL AND EXCHEQUER.**—Progress only is reported from the drift on the 300. There is no change of interest in the formation.

**JUSTICE.**—Work is progressing favorably and the extraction of ore continues, there now being about 1600 tons on the dump.

**SEGREGATED BELCHER.**—The south drift from the raise is now in 214 feet, having been advanced 20 feet during the week.

**BULLION.**—Are cleaning out drifts on the 500 level. The east drift has been cleaned 150 feet and the west drift 20 feet.

#### Arabia District.

**TO SHIP ORE.**—Cor. Silver State, March 10: The unrequitable, indefatigable "never-say-die," go-ahead Lovelock has conceived the plan in order to utilize the refractory ores of Arabia district, to ship them as ballast to Liverpool, thence to Swansea, for reduction. The ships now paying \$1 per ton for ballast would gladly avail themselves of this arrangement, and all hands concerned be benefited, while additional employment would be generated in this neighborhood. Let the good work go on, the more the merrier. Cottonwood is not to be forgotten in this connection; its valuable deposits of cobalt are sought for by several parties anxious to take hold, and Mr. Lovelock is busy negotiating so as to have things moving as soon as possible.

#### Candelaria District.

**BISMARCK MINE.**—Esmeralda News, March 10: A. L. Woodcock, Geo. Wilson and G. W. Koster of Candelaria have leased their Bismarck mine to the Bismarck Mining Co., a California incorporation. The lease runs for one year; the company is to pay the owners ten per cent of the gross yield of the mine. There is also a proviso in the lease to the effect that if the company fail to prosecute the work for a period of 60 days, such failure shall be deemed an abandonment and forfeiture of the lease. The Bismarck has long been considered a valuable property. It adjoins the Potosi and is in the middle of the great mineral belt of Columbus mining district, which has produced millions of the nation's wealth.

#### Cherry Creek District.

**FAVORABLE.**—Fioche Record, March 7: Very favorable reports reach us of the mining prospects of Cherry for the coming season. The Exchequer people have a body of good ore in the mine, under the water-level, and the mine promises to be a permanent property. At the Star, Chas. W. Keeney, who is in charge, and knows the mining lay of the country better than any man living, is very reticent, but parties who are in a position to know, tell us he has uncovered a fine body of rich ore in the upper levels of the Star. Cherry will boom some next summer.

#### Eureka District.

**MARKET LEAD.**—Eureka Sentinel, March 10: The Eureka Con. Mining Co. shipped yesterday by railroad 100 tons of market lead. It has the Peacock blue cast, which denotes a high state of purity. This lead assays only 35 cents per ton in silver, but that amount is above the late average, which goes to show that L. W. Davis is quite successful in refining by the zinc process.

**IMPROVEMENTS.**—At the Eureka Con. Reduction Works a fine new lathe, drill press and engine have been added to the plant. At the assay office the latest improved Oertling assay scales have been received.

#### Montezuma District.

**SILVER MINES.**—Esmeralda Herald, March 10: The Montezuma district is only a few miles across the valley and in an easterly direction from Silver Peak. This district was formed many years ago, and at one time was the scene of considerable activity in mining. There are a great number of silver mines there, which were formerly owned by Matt Plunkett; they were by him sold and in time became

the property of the Shawmut M. & M. Co., who recently sold all their mining property to the Peruvian Mining Co. of Maine. In a few days the present owners will assume the management and the work of development of the mines, which for the past year has been attended with the running of the mill and consequent bullion shipments. It is supposed, however, that there will be an increase of working force on the different mines; among the most important are the New York, Bullion, Nevada and Great Eastern, all of which have flattering prospects, with an abundance of ore in sight to keep the 10-stamp mill in constant operation.

#### Philadelphia District.

**BARCELONA.**—*Silver State*, March 3: We learn that the lessee of the Barcelona, who also owns the Belmont property, is preparing to commence working some of the huge ore dumps of the Belmont mine that have lain idle for 50 many years. Some 10,000 tons of second-class ore are mined and ready for reduction; one dump close by the hoisting works of 2000 tons averages by several assays 20 ounces in silver per ton. There is a gang of men at work mining ore from the 200-foot level that goes—some of it first-class—over 500 ounces in silver per ton, while the second-class will mill 50 to 100 ounces. The Belmont has a vertical shaft 620 feet deep and has produced about \$2,000,000 from its upper workings. There are 2000 feet of this patented ground that can be worked from this shaft—and it is all virgin ground; never has a pick been struck into it. This shaft has a powerful hoisting engine in perfect order over it. The mine is supplied with two large steam pumps that handle the water from the top to the 300-foot level. Since then, however, an eight-inch Cornish pump has been put in that handles the water with ease to the 620-foot level. The cost of this pump and separate engine was over \$60,000. The lessee of the Barcelona and owner of the Belmont has lately milled 100 tons of ore from the dumps and from the mine with such success that he feels certain that this property is of great value and will be no longer dormant. We are satisfied that the railroad now under survey and soon to commence its grading, which will come within a few miles of Belmont, will enhance its value.

#### Pioche District.

**CONCENTRATORS.**—*Cor. Pioche Record*, March 7: The Ely G. M. & Co. are putting in the concentrators which recently arrived. As soon as they are put in, and the teams can haul ore, the mill will start up and will make what is certain to be a successful run. The mine is looking splendid, and while no ore has been taken out except what was encountered in prospecting the mine during the past winter, still the dumps are full of ore and no more miners can be put on until the teams come to clean off the dumps.

#### Red Mountain District.

**SILVER PEAK.**—*News*, March 10: The Silver Peak mines are situated in Red Mountain mining district, embracing a scope of country in the southern part of Esmeralda county. This district has large and well-defined ledges; the mines therein are as valuable as any on the Pacific Coast. It was from 1867 to 1871 that the Peak was booming—when an Eastern company operated the Red mountain mines. For the past year several of the mines have been boded to an English syndicate; this syndicate has devoted considerable time to a study of those mines, and from time to time has caused the immense veins to be sampled and tested. A few days ago Mr. E. Hooper, superintendent of the Garfield mines, visited Silver Peak to take samples from its mines and report thereon in the interest of those to whom the property has been bonded and to whom, no doubt, a sale thereof will be made. Among the most valuable is the Drinkwater mine, a vein of immense proportions. It is situated about eight miles from the town and is worked from a tunnel running parallel with the ledge. The tunnel is in 400 feet. The ledge is 60 feet in width and is diffused with gold throughout its entire width. A winze is sunk in the tunnel at a point 200 feet from its mouth, and is known as Winze No. 1; it is down a depth of 75 feet, whence a crosscut is made to the hanging and foot walls. This mine has been leased to John Chiatovich for several years, during which time he has kept his original little five-stamp mill hammering away and producing gold bullion. This mill has been enlarged and is now of 10-stamp capacity. During the past year Mr. Chiatovich has had a force of 30 men (miners, millmen and teamsters) employed. He has worked 3000 tons of Drinkwater ore, which has yielded \$20 per ton. There is also the Last Chance mine, a location on the same vein, which has been sufficiently developed by incline, shafts and cuts to indicate a mine equal to that of the Drinkwater. There is also the Crown Glory. It is well named, situated as it is on the crown of the great lead and is the "same thing" as the others.

#### Tuscarora District.

**NAVAJO QUEEN.**—*Times & Review*, March 9: Crosscut 200-foot level extended 12 feet during the week.

**COMMONWEALTH.**—South drift, 150-foot level, has been advanced 20 feet, showing some fine ore in the face to-day, indicating a closer proximity to the ore body than expected. No. 1 west crosscut has been extended 25 feet. No. 2 west crosscut has been advanced 21 feet, with ore in the face assaying \$67 per ton. Intermediate drift has been extended 6 feet, and has cut the same ore as in the shaft below the 100-foot level, assays from which return \$1392 per ton. Have stopped work at this point, and started another drift to open up this ore body farther north.

**NORTH BELLE ISLE.**—North lateral gangway, 400-foot level, is now following the vein, which averages several feet in width, and as developed north shows a continuous improvement. The opening of the stope north of No. 3 crosscut, 300-foot level, is developing a good width of ore. Upraise from the 70-foot level is up 36 feet. The ore continues, and the grade is good. Crosscut on this level, to connect with the main shaft, has been extended 20 feet. The stopes at all points are yielding the usual grade of ore. The shipment of bullion during the week amounted to \$101,560.99.

**FOUND TREASURE.**—Stope from No. 1 chute yielding ore as usual. Upraise from 50-foot level has been run up to the surface, the level put in order and work discontinued on it.

**NEVADA QUEEN.**—On the 350-foot level, west crosscut has been advanced 13 feet. The rock is

breaking better. North drift on the east vein has been advanced 22 feet in low-grade ore. A crosscut at this point has been run 13 feet, exposing very fine ore. The ore on the hanging-wall side is not so good as that toward the foot.

**PONDERE.**—North drift advanced 6 feet; ledge 2½ feet thick. Cut 6 inches of high-grade sulphuret ore in the bottom, which is rising in the face of the drift as we advance into the hill.

**BELLE ISLE.**—North drift from east crosscut, 250-foot level, has been extended 7 feet. The ledge shows some improvement. Workings in the old stopes are yielding some ore.

**GRAND PRIZE.**—Mill has been cleaned up and shut down, the final bullion shipment of \$15,224.24 having been shipped this week.

**NORTH COMMONWEALTH.**—Have resumed work in the incline shaft. Work at other points on the surface will be commenced very soon.

#### ARIZONA.

**TIP TOP.**—*Prescott Courier*, March 9: Mr. E. G. Wager, of Tip Top, favors us with the annexed news: There were two line strikes in this camp last week. About two feet of 500-ounce silver ore in the Wallapai mine owned by Tom Wade & Louis Johnson, and a new chimney of very rich sulphuret ore on the second level in the Silver Museum mine, formerly known as the Smithline mine, owned and worked by a Trinidad, Colorado, company. In Carpenter Gulch, Tom Montgomery and Chas. Wilcutt are making about \$100 per week mining and extracting gold rock, and C. E. Champe, Frank Miller and Philip Mischler are developing some fine properties in the same locality, and are all liable to come out rich and respectable. A great many claims in the district are being worked by chlorides, all of whom are taking out more or less ore, and ores are being constantly shipped out, and the present gives promise of being the most prosperous year ever known in this camp. We could afford to pay \$10 per ton more to carry our ores to the sampling works in Prescott than we do to ship them to El Paso or Socorro, but we can't get transportation over the roads as they are now. We live in hopes that ere many years a railroad will be built from Phoenix to Prescott, and coming within eight or ten miles of us on either side (there are two feasible routes), we can ship whichever way we please, and the district will be developed into a big producer.

**ARIZONA COPPER COMPANY.**—*Clifton Clarion*, March 7: The Coronado mine has started operations with a small force and is shipping little ore regularly. In the course of a week or so the great mine will be worked for all it is worth. Consequent upon the resumption of work on the Coronado, many changes have taken place, among which we note: Foreman M. A. Kelly has been transferred to the Coronado from the Metcalf, H. A. Gould being promoted to the position formerly occupied by Mr. Kelly at the latter place. Frank Strauss will foremanize at the King. Ed Whelan has been transferred to the top of the incline at the Coronado, Mr. Findley taking Mr. Whelan's former position at the King. A boarding-house is being erected at the Coronado. A dwelling-house will also be put up as a residence for the foreman. Three furnaces of the company are kept running to their full capacity at Clifton without cessation, and a most satisfactory production of bullion is the result. The experimental hot-blast furnace in course of construction is gradually approaching completion under the superintendence of Wm. Joos.

#### COLORADO.

**FURNACES.**—*Denver Tribune-Republican*, March 10: One more water-jacket furnace and six additional calcining furnaces have been contracted for by the American Smelting Co. These improvements would indicate that not all the smelters at Leadville are going to give in to the railroads, but rather that the contest will continue. The American Co. is closely allied to the Midland Railway Co., as a number of persons are stockholders in both companies. In making the additions announced the American smelter will secure desirable facilities for reducing sulphide ores, in which direction all the Leadville smelters have hitherto been very deficient. The supply of carbonates is daily decreasing while the yield of sulphides is on the increase, so that in order to continue smelting operations successfully it became necessary to erect a large number of roasting furnaces. It is predicted by those familiar with ore bodies of Leadville that within two to three years four-fifths of the output of the once famous carbonate camp will consist of sulphides instead of carbonates and that very little ore, outside of the iron product, will then be found ready for the smelting furnace, but that nearly all the mineral will have to undergo preliminary treatment. The expense of adding and operating roasting furnaces is considerable and the action of other smelters in this direction will be looked for with interest. If others follow the example of the American, it may be accepted as a settled fact that the Leadville smelters are not only determined, but able to continue business; that their situation is not as critical as has been represented, a question that has lately afforded considerable discussion.

#### DAKOTA.

**COLLINGWOOD.**—*Black Hills Pioneer*, March 7: Word comes from Carbonate that lessee Jefferson et al. have struck a good thing in the Collingwood. The force put on, consisting of five men, started drifting from the 100 level of the shaft. The drift was run in a southwesterly direction, following stringers of ore that appeared in the shaft. Though only a few feet have been made, these stringers have led to a solid streak several inches in width, that is apparently widening as each foot in distance is gained. The ore is of high grade, assaying in excess of 100 ozs. silver per ton. Parties interested are said to be jubilant at the results already reached, and more than pleased at the prospects immediately in view.

**RATTLER-GILROY.**—Excellent reports concerning the Rattler-Gilroy continue current. The fact that the mine is in better condition now than perhaps at any time in its history is without dispute. A quantity of high-grade ore, from which a number of toos have been shipped to the smelter for reduction, is

in sight. Whether the lead will prove permanent, only future explorations will determine. Work goes on unremittingly both day and night, and its results for the last few days are said to have been most encouraging, holding forth the promise, as before stated, that the property will hereafter, in all probability, more than pay its own way.

**SPANISH R.**—Work on the upraise has been delayed somewhat, as one of the contractors for timbering has recently been ill, and consequently operations here were in a measure interfered with. A part of the regular force, not working in the upraise, is employed in extracting ore. The superintendent is getting ready for further shipments to the Iron Hill smelter after it is blown in again next Monday.

#### IDAHO.

**BAYHORSE.**—*Idaho Messenger*, March 8: The Ramshorn is the oldest mine in the district, and its lowest workings are down on the vein 1400 feet deep, with levels connected all the way up, forming a complete network. The last 500 feet of the mine has been stopped but very little, thus leaving almost solid ground, pierced by tunnels every 125 feet, all starting and running in on the vein, the longest tunnel being 1700 feet long. Ore from this mine is sent down on a wire tramway, and then hauled down-hill two miles to the smelter. The company has four mines including the Ramshorn, all being on the same vein and similar, and all being operated. The Sky Lark, close by the Ramshorn, which has produced 900,000 ounces of silver, is being operated by A. J. Crook & Co. with profit, and it now looks better than it ever did before. Their high-grade ore, going 300 ounces in silver, is shipped to Omaha, and the low-grade is reduced at the Clayton smelter. The mines close to Bayhorse, owned by Mr. C. E. Taylor, are having some work done on them. Mr. Toole says in summing up the situation that the general outlook of the camp is at least 100 per cent better than it has ever been in the past. The Ramshorn is the deepest paying mine in Idaho or Montana, and it can easily go down to 2500 feet.

**ORO FINO.**—*Owyhee Avalanche*, March 6: Mr. T. Regan and Supt. B. S. Howe, of the Henrietta mine, returned from Boise City on Monday last. From Mr. Regan we learn that mining operations in and about the Oro Fino group of mines will be pushed with the utmost speed as soon as mining material, such as wood and timbers, can be furnished at the mines. In the meantime the drift on the Sinker lode will be continued with all the men that can be worked, and will not be stopped until the Oro Fino ground has been reached. As soon as possible the main shaft of the Oro Fino will be sunk considerably deeper than it is, levels will be run and the mine opened up as it never has been. Indeed the mining outlook for Owyhee was never brighter than at the present time.

**FLINT.**—We hear that a letter has been received here which says that 25 or 30 men will be put to work at Flint in developing the mines. A shaft will be sunk on the Rising Star to the depth of not less than 1500 feet, and levels run to prospect the ground, something that ought to have been done long ago, and which we have reason to believe was advised. We have always had great faith in Flint, and we have not lost any by reason of the present company building a mill and shutting it down without having gone below the grass-roots in prospecting their mine.

**WAGONTOWN.**—We mentioned last week that W. F. Sommercamp, Sr., had cut with his crosscut at Wagontown a large and rich ledge of free-milling ore, carrying gold and silver. Since then development shows it to be one of the best prospects in the camp. The lode is large and the ore very rich.

#### MONTANA.

**SMELTER.**—*Anaconda Review*, March 8: Work at the Anaconda smelter has been crowded the past few weeks as fast as men could do it. The grading for the new building just north and adjoining the present new smelter is well under way. The company had a very large force of men and took advantage of the fine weather and will soon have it ready. The masons and bricklayers have been hard at work the past two days on the foundations. Inside the new concentrator building are three Ball stamps dropping on copper ore, and the silver-mill running at about half capacity. The changes to the new 1000-horse power are now completed and it has been running a portion of the time, though the water-wheel is the principal power which runs the works. Large quantities of lumber and material of all kinds are being received, and as soon as the weather is settled there will be a far larger force working than ever before.

#### NEW MEXICO.

**NOTES.**—*Socorro Bulletin*, March 10: A rich strike of ore is reported in the Ocean Wave mine at Hermosa. The St. Charles-Creigher lease at Hermosa is still turning out big ore. The Templar and Virginian under the superintendence of Col. Hopper is working 30 men. The Oro Fino mine in Water canyon is showing up fine. Free gold is coming in at the bottom in quantities. We are informed that the Merritt mine, situated in the Socorro mountain, will soon be in operation again. Another strike is reported in the Ocean Wave at Hermosa, Sunday. The mining wave is gaining strength. Adna Lamson has transferred his interests in the copper properties situated in the San Andreas to present owners, who will put a force of men to work extracting ore under the superintendence of Mr. Lamson. The Gr at London mine, located in the San Mateo mountains, and owned by Fred Keith, J. W. Richardson and L. R. Whitmore or San Marcial, and Major J. S. Sniffen of Socorro, is now turning out ore which runs three ounces gold. A small shipment was made to Deover last Monday.

**CONCENTRATOR.**—*Rio Grande Republican*, March 10: The Bently concentrator has worked ore successfully from nearly every mine in Hermosa camp. The Organs want concentrating works badly, and if they were put in it would not be long before 20 or more mines in that district which are not worked would be paying.

**STRIKES.**—*Kingstoo Shaft*, March 8: All the late strikes are holding out. Two more made this week of greater importance than any since the Comstock. More working mines, more and better pros-

pects and prospecting ground around Kingston than in any part of the Southwest. Better mines and better prospects are now opening than the mine from which came the two-ton chunk. A \$40,000 deal is pending on the Butte, which joins the Black Colt on the south.

#### OREGON.

**GRANT COUNTY MINES.**—*Cor. Bedrock Democrat*, March 8: The snow is almost gone and the miners are beginning to rally. The present season promises one of great importance to quartz miners in this section. New strikes are reported almost weekly. Geo. Bently recently struck an eight-inch vein of free-milling quartz showing gold all through. The Colorado also reports a new strike. Keystone showing well. The Eagle, under the control and management of the genial and efficient superintendent, R. K. Foster, is showing up well and promises a bonanza to its owners, Eblen & Foster. In fact all the mines are looking well. If the weather continues favorable the placer mines will soon be in operation.

**QUICKSILVER.**—*Jacksonville Times*, March 10: James Chenoweth, who has been operating a quicksilver mine in Douglas county for some time, using three retorts with very good success, has ordered three new retorts here of the capacity of a ton of ore each. Mr. Chenoweth has a whole mountain of cinabar, and as mercury is in good demand and brings a remunerative price, there is a good prospect of a further increase in the plant and output before long.

**WAGNER CREEK.**—*Cor. Jacksonville Times*, March 10: Mr. James Briner has completed a roasting furnace on the creek. It is built on a small scale, merely as an experiment. Mr. Castiel of your city is one of the solid miners here; also W. F. Shaffer, lately of Gold Hill, as well as several others, among whom is Mr. Pittner of Phoenix, an experienced miner from the Empire mine of California. Mr. Philip Mullen is the amalgamator; C. Frank Lewis, engineer.

**GOOD PROSPECTS.**—*Rogue River Courier*, March 8: James Ferren and N. Thoss are prosecuting work in their Silver creek placer mine with a vigor. Sluicing was carried on all winter and now prospects are glittering. This mine extends along Silver creek for a distance of two miles, and Mr. Thoss thinks will eventually prove one of the best paying mines in the county.

**MILL.**—H. H. Keisling, who has control of the old Knox mine by bond, on Applegate, has put in a quartz-mill, which is about ready for use.

#### UTAH.

**PARK NOTES.**—*Record*, March 10: Active work is going on in the Southern Tier and also in the Black Diamond of Snake creek, with favorable prospects in the latter. Within a few weeks the new connections from the lower tunnel will have been completed in the Southern Tier. On account of bad roads and the inability to transport coal and other supplies, work on the Fairview group, between the Empire and the Sampson, had to be temporarily suspended. However, the mine is well prospected. The west drift is in on the vein 134 feet and the east drift has been run 116 feet, and show ore all the way. The two walls are well defined, carrying a true fissure vein, running east and west; it is from eight inches to two feet wide. The ore is high grade, and as soon as greater depth is attained the Fairview will be a good-paying mine.

**ORE AND BULLION SHIPMENTS.**—The Ontario mill will make another bullion shipment to-morrow. During the week the Crescent shipped 130,000 pounds of first-class ore. On Tuesday 8 bars of Daly bullion, 9339 fine ounces of silver, were shipped from the Marsac mill, and to-morrow another shipment will be made. For the week just ended and since ore-shipping was resumed, the Mackintosh sampler received 190,050 pounds of Ontario ore and 38,830 pounds of Sampson ore.

#### WASHINGTON.

**TERRITORIAL NOTES.**—*Ellensburg Capital*, March 2: The giants are now successfully working the Swauk placers. The iron mines of Cle-elum will be worked extensively this year. It is asserted that natural gas can be found in Ellensburg at a depth of 800 feet. At least ten of the Upper Cle-elum gold and silver mines will be worked this season. Arrangements are being made to start up the Hydraulic Co.'s Works north of Ellensburg. In April the Iron Mountain mines will begin shipping iron ore to the Union Iron Works in San Francisco. Nevada miners have been prospecting the gravel beds within a few miles of Ellensburg, and pronounce them good pay. The Chinese are preparing to work the bars along the Upper Columbia this season. Last year they found considerable gold, which they sold in Ellensburg. The *Capital* was mistaken in its statement that the largest nugget ever found on the Swauk weighed \$300. The largest was worth \$760, and was bought in Ellensburg.

#### WYOMING.

**BIG HORN MOUNTAIN.**—*Black Hills Pioneer*, March 10: More than ordinary interest has been taken in the reported discovery of quartz lodes narrowly rich in gold, near Buffalo, Wyoming. In Deadwood at present are a number of prospectors who at one time or another have hunted assiduously for the coveted ledges in the Big Horn range. Conversation with one or two of these was recently had by a *Pioneer* reporter. From them the impression was gathered that the reported discovery may very possibly prove true. From the prospecting they did in the range, they are satisfied that that section of Wyoming will eventually prove wonderfully productive of the precious metals. Encouragement was constantly met, numerous croppings of ledges were found from which pieces chipped displayed free gold, or when taken to an assayer showed it possessed considerable value. The reasons inducing these parties to leave the Big Horns in the face of such promising prospects are obvious, inasmuch as the country was at the time infested with hostile redskins. Two or three have expressed an intention of returning. Correspondence has been opened with reliable residents of Buffalo, whose replies are awaited with a good deal of interest.

1850. 1887  
**RANKIN, BRAYTON & CO.,**  
 BUILDERS OF...  
**MINING MACHINERY.**

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

# THE HAZELTON BOILER.

## A NEW AND RADICAL DEPARTURE IN STEAM GENERATOR.

DESTINED TO REVOLUTIONIZE ALL FORMER METHODS. A SAVING IN FUEL OF AT LEAST 25 PER CENT GUARANTEED OVER ANY OTHER STYLE OF BOILER.

The following parties have these Boilers in use or under construction on this Coast, to whom reference is made:

Spring Valley Water Works, S. F.	1 200 H. P.	Starr & Co. Mills, Wheatport.	1 100 H. P.	San Jose & Santa Clara Electric R. Co.	1 100 H. P.

**HYDRO-CARBON ASSAY FURNACES**

## THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

## AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

### Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

## Engraving

Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of this paper.

Sectional View of Pulverizer.

## PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

### POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. This Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

MARSHUTZ & CANTRELL, Sole Manufacturers.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

Number 12.

## Air-Compressors of To-day.

The vast number of uses to which compressed air is indispensable has demanded that the manufacturers of at least one air-compressor should devote their entire time and attention to the perfection of a machine, for which there is such an ever-increasing sale. The new and improved pattern of the Clayton air-compressors, the

completes the cooling and fills the small clearance spaces.

Another noticeable point is the connecting-rod arrangement, which is made adjustable, so as to carry all the weight of the pistons, rods, etc., and relieves the cylinders from all wear, excepting that caused by the expansion of the piston packing.

The patent safety suction valves are protect

design and construction, would be far from perfect.

This governor operates by cutting off the steam from the air-pressure governor, when the desired pressure of air is attained, and when the pressure is reduced, ever so slightly, it turns the steam on again. The speed governor in combination with the air-pressure governor regulates the speed of the compressor; it

pressors are also made to run by belt, so that if one has water-power available, he can, by the use of a belt air compressor, convert his water into compressed air-power, which will run any machine that can be run by steam. They are also made single with one steam and one air cylinder, or, if necessary, one side of a duplex machine can be detached and run independent of the other. In writing

THE IMPROVED CLAYTON "DUPLEX" AIR COMPRESSOR.

outcome of years of experience, is shown in the accompanying illustration.

Among the features of these compressors, for which the manufacturers claim superiority over other makes (and which will be seen by referring to illustration), are the patent water-jackets which encircle the air-cylinders and effectually cool them their entire length. As the patent on these jackets covers the only practical and efficient method of cooling air-cylinders by the circulation of water around them, an attempt has been made by other makers to disparage their use, but the manufacturers are prepared to demonstrate the advantages of a compressor, using a water-jacket over one without. A small spray of water (or oil) is injected into the air-cylinder with the air, which

is prevented from falling into the cylinder by means of the safety stems, and the independent cut-off valves (shown at the end of steam chests) can be adjusted to cut off while the compressor is running; and as the air pressure is always the same, the valves can be set to cut off either at one-quarter or one-half, or at any part of the stroke as will best suit the circumstances.

The "Clayton Duplex air-compressors" occupy much less space than other compressors of equal capacity, and the fly-wheel is in the center of the machine. Of the other improvements, we must refer readers to the maker's catalogue for a detailed description. We must not, however, omit mention of the patent combined speed and pressure governor, without which these compressors, with their excellent

works perfectly, and is guaranteed to control both the speed of the compressor and the pressure of air, without any attention from the engineer.

The Clayton air-compressors are especially designed for running rock drills, coal cutters, hoisting engines, pneumatic locomotives, etc., in mines, especially badly ventilated ones, the exhaust furnishing cool air for the miners to breathe. Or, if the hoiler is so situated that the steam has to go a considerable distance in a pipe, the loss of power through the condensation of steam is very great, and the advantage of using the steam to run an air-compressor, and sending compressed air through the pipes to work the machines, is obvious, as the loss in friction is little or nothing. These com-

for estimates or prices on an air-compressing plant, the principal things to be stated are the number and size of machines to be run, or the volume and pressure of air required, and the boiler pressure carried. The Clayton Air Compressor Works, 43 Dey St., New York, would be pleased to send their catalogue on application, and to enter into correspondence with any who consider the advisability of supplanting steam with compressed air.

The mines of Gilpin county, Colorado, produced \$2,479,180 in 1887, and \$32,298,342 for the past 16 years, showing an average of a little over \$2,000,000 per annum. At the close of 1887 there were 452 stamps in operation in the county, and 330 stamps idle.

## CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

## Calaveras County Mines.

## Murphys District.

EDITORS PRESS:—The mines at present claiming special attention in this district are the Hidden Treasure, Piety Hill, Mattison Extension and Poverty Hill. This promising group of mines is located in the eastern part of Murphys townsite. The Hidden Treasure, Piety Hill and Mattison Extension are all on one lead with the Poverty Hill on a parallel lead. All of the claims are 1500 feet in length with a surface width of 300 to 600 feet. This group of mines was first discovered by W. Barnes in 1856; from that time up to 1858 about 50 tons of rock were worked for the free gold only. In 1858 a run of 50 tons was made for the gold only; this gave an average of \$43.50 a ton. Shortly after this Mr. Barnes died and the mines remained idle until 1883, when Mr. J. Moss came into possession of the property, and, in connection with Mr. J. Mattison, prospected one of the locations. In May of 1887 Mr. D. W. Stone purchased Mr. Mattison's interests and development began in earnest. Messrs. Moss and Stone have done all the work on the mines themselves, even to getting out the timbers in the mountains for the mines. Patiently, steadily working away, experienced miners and millmen, they have seen growing under the stroke of pick and drill a property that to-day has few superiors.

On the Hidden Treasure a shaft has been put down 35 feet, showing a three-foot vein of ore carrying galena and sulphurets, gold and silver bearing. On the Piety Hill lode a shaft 90 feet in depth has been sunk, proving a 2½-foot vein of galena and sulphurets, rock, from which 40 tons have been worked for the gold alone and gave \$43.50 a ton.

On the Mattison Extension a shaft 50 feet in depth discloses a 2½-foot vein. From this vein two lots of ore have been worked by the Selby works of San Francisco which gave: Lot No. 1—gold, \$70.84; silver, \$20.29. Lot No. 2—silver, \$29.47; gold, \$100.99 a ton. On the eastern end of this claim open cuts for a distance of 300 feet show a vein of an average width of 12 feet, carrying free gold and assaying \$150 to the ton. At this point a parallel lead crops out. An open cut on it shows a two-foot vein of rich rock; a lot of rock from this lead, milled for the free gold only, gave \$10.60 a ton.

Poverty Hill parallels the other three locations. On this lead is a 40-foot shaft showing a 2½-foot ledge that glistens with galena and sulphurets. Open cuts along the surface for 300 feet show a large lead of evenly mineralized rock, all high-grade ore. Of the three leads and five locations it is a difficult matter to say which is the richer or most promising, as the leads are not 100 feet apart. The average size is about the same, and they are all of the same general character. That the richest rock has not been milled is evident.

An examination of the ore sacked for shipment shows it to be only of the average character of the vein. There is not a shaft, open cut or cropping hut shows mineral, and in most instances a large per cent of the rock is rich. Pieces of rock broken from the croppings here and there, in every instance showed mineral, and in most cases, free gold. This group of veins is in limestone with porphyry dykes. The veins are almost perpendicular. As several feet of decomposed vein matter accompanies each vein, the expense of sinking and extracting ore is comparatively small. No water has been encountered in any of the shafts. The hill on which the mines are located pitches to the east, affording a fall of 150 feet for millsite and water-power, the Union Water Co.'s ditch crossing the mines at their highest point.

There is in this group of mines all that could be asked for in a mining property; first, an abundance of high-grade ore; second, the ore can be mined cheaply; third, millsite with water-power can be had; fourth, it is in a section of country where mining can be conducted on every day of the year. Labor and mine supplies are cheap. All that is wanting is capital to erect the necessary works to extract the gold and silver and this group will prove itself a "hidden treasure" indeed. The present owners are hard-working, practical miners, but without the necessary means to build works suitable for the extraction of the gold and silver in these galena and sulphurets ores. In consequence they desire to sell or arrange for the necessary works with a moneyed partner. To those looking for a good mine I would say investigate for yourself and you will see that the half has not been told. That unlike most mines it exceeds its reported value, and is a group that, taking everything into consideration that goes to make up a paying mine, is seldom equaled, if excelled.

E. H. SCHAEFFLE.

Murphys, March 7, 1888.

## The "Silver Plant."

EDITORS PRESS:—In your issue of March 3d you describe a plant which you called the silver plant. I will say for certain that the plant grows in our mineral belt. In the mineral belt of Tascara it is very common.

We have two of the kinds. That which you describe in your paper is quite common.

Another kind resembles that described, yet it is a different plant of the same species.

The No. 2 plant has a thick bunch or mat of leaves, green, and covered with a heavy coat of hair, the leaves being smaller than No. 1 and more "hairy." The stem shoots up the same as No. 1, but the flower differs from it in being of a mushroom or parasol shape. A cluster of small flowers, usually slightly colored, is found near the center, and the petals are rose-colored. Sometimes this flower is snow-white. It does not grow so rank or strong as No. 1. Usually the stem is from three to eight inches in height. The flower is from the size of a ten-cent piece to that of a two-bit piece. I have often noticed this flower, and thought it ought to have a place among our domestic flowers, as it is far superior to many of the flowers cultivated. I refer to what I call No. 2.

I will also state that I have no knowledge or do not remember of having seen either of these plants outside of the mineral belt in this vicinity. I have lived here for 11 years, and frequently make trips outside of belt, but don't remember of having seen said plants outside of the mineral belt.

A. B. McDONALD.

Tascara, Nev., March 7.

## Idaho Lead-Silver Mines.

## Immense Veins of Galena-Carbonate Ores.

EDITORS PRESS:—The famous Viola mine, two miles above the town of Nichol's, is producing more ore than ever. Nearly 75,000 tons of heavy carbonate ore have been taken out, most of which has been smelted at the Viola smelter. About 100 tons of carbonate galena ore is smelted daily, turning out about 40 tons of lead-silver bullion. Very large ore bodies are exposed in the Viola mine; in fact, the hundred-ton daily output makes a very insignificant hole in the ore, there being, at a conservative estimate, fully a year's run of ore in sight. About 200 men are employed mining, smelting, freighting, burning charcoal and chopping wood. Wages average about \$3 per day. Were all the mines in this region worked, there is no known section in the West that could rival its production of metal.

Nearly all the mines here are still owned by the prospectors or original discoverers, and these owners being unable to properly develop the claims, hold on to them from year to year, doing assessments and putting them in order for sale.

Were mining capitalists to come here they could pick up a number of very fine properties in this vicinity, among which may be mentioned the Andes silver mine, a large galena-carbonate lode; the Daisy Block, Ingersoll, and Latest Out, galena carbonate veins, and the Paymaster, a big copper lode. Besides these mines, which are partially opened, there are many very fine prospects in the country which show more or less pay ore and could be had cheap. In this immediate vicinity, say within 25 miles, the mines are almost exclusively lead, copper and silver. The veins are very large, being principally contacts and fissures, measuring from 10 to 60 feet in width, and continuous for hundreds of feet in length. The geology of the region is: Limestone (devonian and silurian), quartzite (primordial), porphyritic granite (archean), and dykes of porphyry breaking up through the sedimentaries; also, basaltic lava dykes near the base of the mountains.

It is typically a lead-copper-silver region and will, eventually, prove a very large producer of these metals. North and northwest of this place some 50 miles, the great Salmon-river gold region begins and extends to an unknown limit. This gold country, as elsewhere, is composed of slate, granite, and porphyry mountains—a great, broken, and strictly rugged region, which will be many years before it is half prospected. Some 300 miles of the above country (Salmon river) was examined by the writer last season, and it was all observed to be a mineral region of great promise.

CHAS. F. BLACKBURN.

Nicholia, Idaho, March 5, 1888.

## Cost of Handling Ores.

EDITORS PRESS:—In your issue of March 3d (page 134), the table giving the comparative cost of handling ores by the iron precipitation and preparatory calcination processes contains some typographical errors. The table should be as follows:

	By iron precipitation.	By preparatory roasting.
Cost of calcining 1 ton ore		\$4.00
" " " " " "	6.00	6.00
" " " " " "	2.00	
" " " " " "	2.00	
" " " " " "	1.00	
20 per cent of expenses saved by rapid smelting consequent upon preparatory roasting, etc.	0.40	
25 per cent fuel saved..	0.80	
Total cost of smelting 1 ton ore.....	\$12.20	\$10.00

Please make above corrections in your next issue and oblige

W. L. AUSTIN.

THE gypsum deposits of the Black Hills in Dakota are pronounced equal to those of Nova Scotia, which are the purest yet discovered. The manufacture of plaster has already begun at several points.

## Matting Dry Auriferous Silver Ores.

The following paper was read by W. L. Austin of Toston, Montana, at the Utah and Montana meeting of the American Institute of Mining Engineers:

The only essential difference among the three methods of collecting the precious metals from their low-grade ores by fusion is comprised in the nature of the vehicle in which those metals are concentrated. If lead or copper ores are used, the processes are respectively lead or copper smelting; but when the sulphide of iron forms the matrix in which the gold and silver are collected, the process is known as pyritic smelting. The latter method presents rarely any advantages when lead or copper ores are available at rates which permit profitable treatment.

## Pyritic Silver Smelting.

Defined by Percy as "the smelting of silver ores, which are either free from lead or do not contain it in sufficient quantity to collect the silver, in conjunction with pyrites, in order to produce a regulus in which the silver may be concentrated," is not, as the name would imply, confined to ores of this metal alone, but embraces auriferous silver ores, or even gold ores simple. This method of collecting the precious metals from low-grade dry ores, employed at Freiberg by Barthel Kohler in 1835, does not appear, up to the present, to have been introduced into this country on a working scale. And yet the possibility of getting rid in a single operation of all the earthy or siliceous gangue of a low-grade ore and concentrating the precious metals in a matte without loss of lead (which includes gold and silver) by elagging, or volatilization, at the same time producing a highly siliceous slag, very nearly if not quite as clean as is usual in lead smelting, certainly commends itself. In some parts of the country, owing to the competition met with from the large smelters, established at railway centers, lead ores (and by lead ores I mean such as in a smelting mixture furnish a sufficient percentage of that metal to permit economic smelting) command prices that render their treatment *per se* by local smelters an unremunerative operation; the result being that lead ores are drawn away to other establishments, leaving behind a greater quantity of low-grade ores not suitable either for the milling process or for concentration, yet which might be advantageously collected in an iron matte.

The absence of this one from among our metallurgical processes is partially due to the perfection of the American silver-mill, which, in the majority of cases where the above-specified ores are met with, is peculiarly adapted to Western conditions, namely, expensive fuel and labor. But the fact may be also accounted for by a disinclination to depart from the established lead-smelting process, even when the lead in the ore itself must be handled without profit, or, as is sometimes the case, at a loss.

During the summer of 1884, while engaged on professional work in Montana, my attention was attracted by the large quantity of

## Dry Silver-Gold Ores

Awaiting reduction. The available lead-ore supply seemed utterly inadequate for economic silver-lead smelting; besides, competition from outside had brought the ores up to such a figure as to render their treatment unremunerative, nor were many of the ores at all suitable for wet concentration. But to offset these disadvantages, extensive bodies of iron pyrites, within easy access of the dry ore, suggesting the practicability of pyritic smelting. A close examination of the field led to the conviction that such a process was the best means of beneficiating the majority of these ores, namely, those high in silica and low in silver and gold, and to the building of the Toston smelting works.

## Toston

Is a small collection of buildings on the bank of the Missouri river, about 40 miles east of Helena, on the line of the Northern Pacific, a point about equally distant, measured by cost of transportation, from the dry ores and the pyrites mines, and at the same time in close proximity to lignite coal and limestone quarries. The Toston plant was intended solely for experimental purposes, to determine how far the process was adaptable to Western mining enterprises, namely, to quick returns on capital invested, when coupled with those necessary adjuncts, expensive fuel and high-priced labor. At the time of starting these works, no information of the process having been tried in this country, beyond vague rumors of attempts made in Colorado, could be had; therefore there was no American precedent to serve as a guide. To copy the European practice with its large percentage of fluxing material, small furnace capacities, and high fuel consumption, was out of the question. The practice at Kongsberg, Sala, Lend, Freiberg, Schömannitz, Lower Hungary, Transylvania, and the Altai mountains was carefully studied as far as available literature would permit; and in the spring of 1885 the first furnace was built, a rude affair constructed wholly of sandstone, with water tuyeres, and the approximate dimensions of the ordinary Western lead furnace. The feasibility of the scheme was so conclusively shown by the operations of this furnace, that foreign capital took hold of the enterprise, and the experiments were continued with better apparatus. Different styles and forms of furnace were tried, including the

Herreshoff patent, and the works were being fitted up for handling a large amount of ore, when the recent passage of the Alien Act by Congress caused a suspension of operations, and resulted in the temporary leasing of the property to a company handling the newly discovered lead ore of the Cœur d'Alenes.

The three years' work at Toston demonstrated that, under conditions existing at that place, the

## Best Style of Furnace

For the matting process is what the Germans call a *Spur ofen*; that is, a furnace without crucible, which is closed a short distance below the tuyeres, and from which the smelted products are permitted to flow continuously. The many difficulties which presented themselves as long as a crucible furnace was employed disappeared altogether when that furnace was converted into a *Spur ofen*, and an outside receiver was attached. A duplicate of the Herreshoff furnace, which does such excellent work at Lanrel Hill, New York, was tried and abandoned, on account of the passage communicating between the furnace and receiver becoming constantly choked up. This may have been due partially to the tendency of iron matte to chill suddenly (its fusing point lying above both that of copper and lead matte), and partially also to the use of highly siliceous slags, which do not admit of rapid smelting, and consequently did not furnish a sufficient flow of molten matter from the furnace to the receiver to keep the passage open. On a basic charge and copper matte, the furnace is said to work perfectly. Narrowing the smelting-zone and depressing the tuyeres also assisted operations materially.

On the continent of Europe, blast-furnaces are used almost altogether for pyritic smelting (raw smelting as it is termed). At Sala, in Sweden, the furnace used is a *Spur ofen*, with a tendency toward the snmp type; but the latter is the usual style of furnace used for this purpose. They are generally built very high, of small capacity, with one or two tuyeres in the back; whereas, at Toston, the best results were obtained with a very low furnace and large volume of air. Considering the perfection which furnace-building in this country has attained, it should be possible with a furnace of large capacity (about 150 tons in 24 hours) to make very satisfactory returns.

The method of feeding a matting furnace is of the very greatest importance, for unless precautions are used, the easily fusible sulphide of iron agglutinates the charge above the smelting zone, and chokes up the furnace as fast as it can be barred off.

## The Slag

Made at Toston range in silica from 30 to 48, in protoxide of iron from 27.24 to 49.73, and in lime from 4.7 to 26.93 per cent. Numerous experimental slags were tried, the object being to run the silica up as high, and the lime as low, as consistent with economic work. It was found much more difficult to keep the silver than the gold out of the slag. Slags showing merely a trace of gold (duplicate crucible assays, one assay ton each) were made when the matte carried as high as \$67 per ton in the metal, and 125.5 ounces of silver. Although the silver would run up more often above than below an ounce, it did not, with the proper combination of silica, iron and lime, average as high as 2 ounces. According to Percy, the slag made at Kongsberg in Norway usually carries less than 1 oz. per ton (2240 lbs.) in silver on a matte running about 80 oz. per ton. Lime certainly has a very beneficial effect on the slag. Our cleanest Toston slags went high in silica and lime, and low in iron. As the losses are usually supposed to be mechanical, a siliceous lime-slag may assist the separation of the metal by reducing the specific gravity of the slag; but Percy's experiments in fusing Ag<sub>2</sub>S with different substances, among which are iron and lime, suggests a possible chemical origin for these losses. These experiments show that where a substance, such as K<sub>2</sub>O, NaHCO<sub>3</sub>, or metallic iron (?) decomposes Ag<sub>2</sub>S at a high temperature, the resulting fluid product carries considerable silver, while a great portion separates out in the metallic form; whereas, when lime is mixed with Ag<sub>2</sub>S and subjected to a white heat, no chemical action takes place. Keri also recommends a bisulfate carrying lime. However, I got very good results on a slag carrying the highest percentage of iron and the lowest of lime mentioned above. Local conditions make the economy of such a slag more than counterbalance the loss.

I am not prepared to say how far the

## Concentration of the Precious Metals

In no iron matte can be safely carried. The richest carload of matte shipped from Toston ran 3.35 oz. gold and 125.5 oz. silver (approximately \$200) per ton; but Keri speaks of concentrated matte made at Kongsberg, carrying from 583.33 to 759.16 oz. per ton (2000 lbs.), and my experience leads me to believe that a more valuable matte could be produced than that above mentioned as shipped by us. The loss both of gold and silver is almost wholly in the slag, and is usually explained as due to the mechanical adhesion to the latter of small particles of matte. The higher the temperature at which the separation takes place, and the lower the specific gravity of the slag, the better the separation and consequently the cleaner the slags. In Europe it has been the practice at most places where the pyritic process is used to roast, concentrate and desilverize the matte by a complicated series of operations, all having in view the production of bar-silver,

In this country, concentration and refining can be omitted from the calculations of the producer, as a ready market exists for the product at almost any of our large copper or lead smelting establishments. One offer for our Toston matte, f. n. b. at works was \$20 per ounce for gold contents, and 95 per cent of New York quotations on silver, deducting a treatment-charge of \$15 per ton and \$1.50 for freight. For lead bullion of the same grade, the best we could do at the time inquiries were made was for silver, 97 per cent of New York quotations, and for gold the same as in the case of matte; but the freight charges to market amounted to some \$23.40 per ton.

Cost of Shipping and Refining Bullion and Matte.

Value of material \$200 per ton, half gold, half silver. Gold estimated at \$20 per ounce; silver at \$1. No allowance made for loss in handling lead.

	Bullion.	Matte.
Gold .....	\$100 00	\$100 00
Silver .....	97 00	95 00
Total .....	\$197 00	\$195 00
Less freight and treatment .....	\$23 40	\$1 50
Total proceeds of one ton .....	\$173 60	\$173 50

Showing a margin of \$4.90 in favor of the matte. Owing to the low grade of material which is aimed at by the matting process it is hardly probable that a matte will be produced in one operation carrying over \$200 per ton. However, if circumstances should demand a concentrated product, the first matte could be partially roasted and melted again with siliceous ores, putting the slag resulting from the operation (which would probably be too high to throw away) back into the first smelting.

Since writing the above, I have seen Mr. E. Gylben Spilsbury's paper on

Experiments in Matting Iron Sulphides.

Mr. Spilsbury has been misinformed in regard to my own work to which he refers. We never purchased any copper ore at Toston, nor have we purchased lead ore during the past two years. Our best results were obtained when running on pyrites alone, with just enough siliceous material mixed with them to insure a proper slag. Our pyritic ore, although not requiring concentration, occupy a fissure in solid diorite (?), averaging about 30 inches in width, and are so broken up in mining that 50 per cent has to be sent to the caloner and roasted, the material being afterward mixed with lime and "bricked" preparatory to being put through the last furnace. The failure of the gold to concentrate in the matte in the Boston experiments referred to by Mr. Spilsbury might have been due to the absence of any metal with which the gold could associate itself. In the Toston experiments, besides a little lead which usually separated out in the metallic state, the matte contained silver in varying amounts from 20 ounces per ton upward. That the gold could not be kept out of the slags at Boston, might also be accounted for by the low heat to which the charge was subjected. This difference between the results obtained from a blast-furnace and those from laboratory experiments can be in a measure anticipated. I do not recall any slag made at Toston which carried as high as 0.2 ounces gold per ton, and the average was below 0.05 ounce. We estimate that at Toston we can handle \$13 gold ores by themselves without loss, but when mixed with dry ores at ruling prices we can treat such gold ores at a profit. This includes mining and hauling 12 miles, the use of coke at \$19 per ton, and the shipment of the matte half across the continent for further treatment. Of course, with facilities for wet concentration, a much lower grade of material can be handled.

TABLE SHOWING THE VALUE OF ORES TREATED BY PYRITIC SMELTING IN OTHER COUNTRIES.

At Lond, in Austria—Average value of the ore treated in 1886:	
Gold .....	0.117 ozs. per ton.
Silver .....	0.915 ozs. per ton.
Copper .....	2 per cent.
Lead .....	1 per cent.

At Kongberg, Norway—Average value of ore treated: silver, 6.71-35 ounces per ton.

At Talathan, Transylvania—Average value of ore treated: 9.65 ounces auriferous silver per ton.

In the Altai Mountains, Prussia—Average value of ore: 14.58-17.5 ounces of silver per ton.

In Lower Hungary—Average value of ores treated: 17.50 ounces silver per ton.

At Lala, in Sweden—Average value of ore treated by this process: 8.46 ounces of silver per ton.

(To be Continued.)

SHASTA COUNTY is said to contain one of the best chrome mines in the world. It is located on Shotgun creek, on the railroad, not far from Sims Station.

A Flowing Well.

Artesian wells are proving such an important factor in agricultural production in some parts of the State, and promise so much more in the development of our arid regions, that it is appropriate that we should give prominent place to an engraving of a flowing well with the latest improved appliances for directing and regulating its flow. The engraving is made for the PRESS from a photograph of a well in Miramonte Colony, in Kern county, and though the engraving may have few artistic features, it has the superior advantage of truth to nature in its representation.

It will be interesting for the casual reader or for those who have not given much attention to the subject to mention a few general facts in connection with artesian wells in California. Probably the oldest large group of wells in the State are those of the lowlands of the Santa Clara valley, where small fruits and vegetables have been grown with artesian water for a generation. The lowlands of Los Angeles county follow in point of time, and yet it is a score of years since three in the neighborhood of Anaheim became famous. Within the last 10 years wells have been bored singly or in groups in large numbers in nearly all parts of the State, and though there have been instances of exceeding depth of penetration and high expenditure without much aqueous return, it is safe to say that as a rule California artesian

now common, while two and four inch was the earlier size.

The upper San Joaquin is an ideal region for well-boring, as no rock tools are required. The bore encounters layers of sand and clay, sometimes well compacted, but still easily penetrated. The usual rates for well-boring in this region are given as follows: For the first 100 feet, \$50; for the second 100 feet, \$75; for the third 100 feet, \$100, and a proportionate increase for each 100 feet. The casing ordinarily costs from 35 to 50 cents per foot, and the owner of a well is expected to board three men while the work is being done, which takes from three to five weeks, according to the number of accidents that happen during the work, these accidents arising mainly from quicksand choking the pipe and the jamming of the casing.

As might be expected, the lower levels yield the cheapest and the best flowing wells. Mr. Raymond, whom we have just cited, says the artesian district of the San Joaquin valley may be defined by the line of 300 feet elevation. This line "curves in and out around the valley, and nearly incloses its greatest area." Many wells bored above this elevation have not been flowing wells, but have to be pumped. There are, of course, exceptions, and flowing wells have been secured at a higher point, but these are believed to have struck the flow from a natural reservoir higher than that which feeds most of the valley wells.

Our engraving shows a well in the Miramonte colony, and is typical of the best flowing wells.

Mechanics' Institute.

At the annual meeting of the Mechanics' Institute the report of Hnree Wilson, the librarian, for the year ending February 29, 1888, showed that the receipts from members' fees and dues were \$2276 in excess of those of the previous year. There are 2982 paying members in good standing, 167 life members, and 11 honorary members. The gain in membership during the year was 308. The present number of volumes in the library is 45,051, a net increase during the year of 3586. The percentage of missing books has been greatly reduced. The loss is largely from the fiction class, and is believed to be principally the result of carelessness rather than of intention. Frequently, however, valuable books are missing from the reference department, and valuable books are sometimes mutilated in order to obtain brief articles or drawings. There is no apparent remedy for these evils, though careful supervision is exercised. It is encouraging, however, to note that the perpetrators of these depredations have occasional spasms of conscience. Recently several valuable books, missing for years, have surreptitiously reappeared upon the shelves, and once consciences money was sent the librarian by mail. The gifts to the library were 411 bound volumes and 302 unbound volumes and pamphlets.

The constantly growing work of the library makes it necessary to ask for relief from crowded shelves and restricted premises. This matter, it is understood, is receiving the attention of the board of trustees.

The treasurer's report showed a balance in the library fund of \$3558.23. The pavilion fund showed a balance of \$361.89, and the balance in the sinking fund is \$403.34.

The president in his report summarized the year's work, and showed that last year was one of the brightest in the history of the institute. In every department there has been progress, and he was pleased to be able to say he had no drawbacks to bring to the attention of the members.

His reports of the officers were ordered printed for the use of the members. A vote of thanks to the president for his able and faithful services was proposed by W. T. Garratt and carried unanimously. The trustees who were elected at a recent meeting were installed by W. T. Garratt.

Working Tailings.

The ancient fortune-teller who confidently predicted that by the time the Chollar mill started \$4000 would course and tingle down Six-mile canyon daily, inviting 500 miners, and sluicers and millmen to pick them out of the mud, has changed his tune. He now says that owing to the fact that the mills get a far larger percentage of the assay value of the ore, etc., the owners of blanket sluices in Six-mile canyon maintain that they can barely make miners' wages. When things prospective bore their most roseate appearance, an *Enterprise* reporter took a spin down Six-mile canyon and interviewed every sluice-trotter from the head of the canyon down to its mouth, and showed beyond all cavil that the canyon could cackle if it ever afforded remunerative employment for 100 men. The sluicers down the canyon, who have caught tailings in reservoirs, claim that their best assays don't exceed \$1.40 per ton. The millmen themselves claim to work their ores so fine that the tailings escaping don't assay more than \$1.65 per ton. From the above facts it is easy to figure all that goes down the canyon. The California mill works about 340 tons daily, and the Chollar mill 70 tons, making 410 tons. Multiply this by \$1.65 and you have \$676.50 rolling down the canyon daily. There is not a man on the lode who knows the difference between a quartz-mill and an apothecary's mug who claims that the sulphurets saved in the sluices can be worked to over 50 per cent of their assay value. This reduces the value of the daily escape of wealth down Six-mile canyon to \$338.75. Times are not yet sufficiently down on the Comstock to induce 500 men to cut each other's throats for this sum of money. Every man working at sluicing down the canyon to-day is on the lookout for a \$4-a-day job, and as the world goes, is jealous of those who have them.—*Virginia Enterprise*.

THE California Bridge Company has been awarded a contract by the City Council of Santa Cruz for a new iron bridge across the San Lorenzo river. The new bridge will extend Riverside avenue to the beach, making another thoroughfare from the center of the town to the bathing-grounds.

PHOTOGRAPHIC VIEW OF FLOWING WELL IN THE MIRAMONTE COLONY IN KERN COUNTY.

wells are comparatively shallow, very cheap and exceedingly profitable, in many cases yielding their horers in actual value of water and enhanced value of real estate hundreds of times the expenditures required to secure them. We have not time to review the wells of the State; an interesting volume could be written on the subject. Perhaps the most famous artesian localities developed during the last decade are the San Bernardino valley, including the new Gees wells for the irrigation of an extension of Riverside, the Ontario and Pomona well, and others in Los Angeles county, the vast artesian districts of the San Joaquin valley and the interesting mountain artesian district of Sierra county. Besides these there are gas wells, oil wells and water wells here and there which an antiquer would describe as too numerous to mention.

As the well shown in the engraving is located in the rapidly developing region of the upper San Joaquin valley, it will be proper to speak especially at this time of that neighborhood. A few years ago we gave a map of the artesian wells of Tulare county, and we have given enumerations since then, but the well-borers work so fast, and the land-owners like flowing water so well, that any enumeration rapidly becomes old. A writer in the *Chronicle* last week apparently, after considerable research, gives the number of wells in the San Joaquin valley at 350, with a flow of 100,000,000 gallons every 24 hours. Of these Tulare county claims, according to the *Valley Record*, 120 wells flowing upward of 25,000,000 gallons each 24 hours. Kern county, according to a recent enumeration by Mr. George A. Raymond, had 41 wells with a daily flow of 48,000,000 gallons. Mr. Raymond has taken the utmost pains to verify his estimate of the flow of these wells in Kern county. The fact that fewer wells in Kern yield more than a larger number in Tulare is accounted for by the fact that the Kern wells are all of recent boring, and a much larger diameter is now secured than was sought for in the earlier Tulare borings. Ten-inch wells are

The arrangements for capping is that shown in detail, with sectional drawings in the PRESS of Sept. 24, 1887. It has an anchor underground which securely holds on the capping device, and thus by turning the valve, which the man is represented as doing in the picture, the flow may be stopped or regulated at any point from zero to a full flow. There is a law that all wells shall be capped when the water is not in use, and this should be done for two reasons—first, because it has been shown that artesian streams can be diminished by excessive draught upon them, and second, that water-soaked soil is not desirable either from a producing or sanitary point of view.

The effect of artesian wells is to rapidly develop the region in which they are obtained. Such is the fact in Tulare county. Kern county also is being enriched by a number of colony enterprises and the incoming of large numbers of colonists. Besides the Miramonte colony, one of whose wells we show, there is another enterprise, the Smyrna colony, which has a well with a daily flow of 2,000,000 gallons and many more in prospect. These wells and the enterprises based upon them bid fair to transform a vast arid region into thickly settled and prosperous communities.

THE COPPER TRUST CLOSING IN.—The New York *Post* says that for the past three weeks M. Secretan, head of the French syndicate which has been cornering copper, has been in London, and has finally concluded arrangements which put the copper supply of the world in control of the company of which he is the representative. He has previously secured the whole product of the Rio Tinto, Tharsis, and Mason and Barry mines in Spain, which produced nearly all the copper mined in Europe, the Cilumet and Hecla, Anaconda, and others in this country, and the only thing left for him to do was to secure the co-operation of English smelters. This done, he had only to set the price for copper and it could be maintained without difficulty.

## Passing Events.

The outrage at the Providence mine has aroused great excitement at Nevada City, and active steps are being taken to find out the men who placed the dynamite in the pipes. It is naturally concluded that the attempt to destroy the property of the company was owing to the miners' wages question.

The United States Supreme Court has decided that the Bell telephone patent is a valid one. The case has been some time pending and involved millions of dollars.

Attention is again being turned to the iron mines of Oregon, and new furnaces have been built. No doubt that the iron resources of that State will be more fully developed from this time on.

The people of Deadwood, Dakota, have raised by subscription \$40,000 of the \$60,000 required to put up the new reduction works at that place.

The murder of Mr. Cyrus Gribble, superintendent of the Vulture mine, Arizona, while carrying bullion to town, removes a skillful mining man, and one highly respected by all who knew him.

## Work for Government Engineers.

A bill has been introduced in Congress providing for the appointment by the Government of a commission of engineers to examine and report on the mining debris question in California. As the services of this commission, if appointed, will be attended with no expense to either the farmers, the miners or others more immediately interested in the adjustment of this much-vexed question, we can see no good reason why it should meet with opposition in any quarter.

Yet that portion of the newspaper press that represents the farming interest in the localities affected, objects to the appointment of any such commission on the ground that this matter having been passed upon by our home judiciary, ought to be considered settled, and finally disposed of. The hydraulic miners, say these papers, having, after a full investigation of the case by the courts, been enjoined from further operations, ought not now to be granted a rehearing, nor should the Government itself presume to seek additional information on the subject. The miners, on the other hand, are not only willing but anxious that the proposed commission shall be appointed and that the members shall enter upon the performance of the work to be assigned them at once.

Why any one should oppose the action here contemplated to be taken is what we fail to understand. If this corps of engineers shall accomplish no good, they will certainly do no harm. Possessing no judicial powers, they cannot remove the injunctions issued by the courts or otherwise interfere with the action taken by them. The findings of these courts will stand as they are until reversed by some higher tribunal or modified by Act of Congress. The status of the whole business will remain as it is, be the report of the commission what it may. Why then should the anti-debris people or their organs object to this commission being instituted and going on with its work, which will consist in ascertaining and presenting the facts as they find them?

This question of filling up the navigable rivers and waters of the State is one of general concernment. It is not confined to the parties to this controversy. The whole country is interested in the subject. If navigation has been impeded by the mining debris to a troublesome extent, it is Congress that will have to provide the remedy, and that body may not feel like voting the money required for such purpose without additional information on the subject, and more especially of information derived through thoroughly competent and disinterested channels, that already obtained having been more or less warped by interest or colored by local sympathy, friendship or prejudice. From this sort of bias a corps of Government engineers would be wholly exempt. Being strangers to all concerned, knowing neither friends nor clients, they would be little influenced by that bias which is apt to create in the heat of men a leaning toward the side of their employers. As the expenditure of large sums may be necessary in dealing with these obstacles to navigation, it is only reasonable that Congress should desire to obtain data through independent sources of information.

Again, the General Government is interested to maintain our output of gold at as high a figure as possible. Now, as is well known, that output has been diminished by the closing of the hydraulic mines to the extent of several millions annually. If, by any means, this production could be restored, or partially so, the public good requires that it should be done. Of all the world's wants, that of more gold comes the nearest to being universal. Now, it may well happen that this body of trained engineers, having ample time and opportunity to examine the conditions, will be able to suggest means whereby hydraulic operations may be in large part resumed without detriment to any important interest. But should they fail to do so, no one would be damaged thereby. The case of the miners would be no worse, while that of their opponents would be improved. So far as mere sentiment goes, all would be better satisfied—the miners, because they would feel that they had been fairly and impartially dealt with, and the farmers, because of the great gain it would be to their side.

Whatever the conclusions reached by these experts, they would be generally accepted as ending the controversy now being waged be-

tween the hydraulic miners and the owners of the valley lands. Though adverse to them, these conclusions would be apt to meet with general acquiescence on the part of the miners, who would then very likely give up the fight and submit to the inevitable.

As matters now stand, the miners and their friends feel deeply aggrieved, and, although these parties have everywhere submitted to the decrees of the courts, the smoldering embers of discontent are liable at any moment to break out. It would be worth a good deal to the country to have this spirit of discontent allayed and this very troublesome question put to rest, even at the expense of some injustice done the miners.

## Sacramento River Placers.

It may be a surprise to many to learn that active steps are being taken to mine again on the upper Sacramento in localities where the pioneer miners of the State took out considerable gold. Within the past few months claims have been taken up for 15 or 16 miles along the river. Many of the creeks, ravines, and gulches emptying into the river have yielded great wealth. Among these may be mentioned Middle creek, Rock creek, Jenny creek, Gold Run. Wing-dams were built in early days, and as much of the bed mined as could be reached by this method. Although the bed was found to be "spotted," fair pay was generally made. Still it has always been recognized that could the river-bed be laid bare for any distance, large amounts of gold could be secured. What lies in the main stream has been probably washed in from the side creeks and ravines. Vast deposits of gravel, boulders, etc., have been washed down for ages from sections of country that have yielded their millions, so that it is not unlikely that large quantities have been washed into the river.

Recently a company has been formed called the Redding Sacramento River Placer Co., and they intend to prosecute work. It is expected that a dam will be built by the Shasta Water Company to obtain water for irrigation and manufacturing purposes, and below this it will then be possible to do some mining. A well-known gentleman of this city has been investigating this question, and he has interviewed men who have worked claims for 20 years along the river, and they state that it has been found very rich in several places. One man has been working by getting up what he could from the bottom with a long-handled shovel, taking out from 10 to 50 cents at a time on the shovel in some places. Wing-dams have been built for miles wherever the water was shoal enough to do such work in. During this gentleman's observations he has taken moss from the rocks and found gold in it, the moss acting as a blanket in catching fine gold.

A good deal of the ground along the sides of the river has been worked over and over again. After a dam has been put in the river will be to a great extent bare. On the banks near the river in some places river men are making from \$7 to \$10 per day to each rocker, or from \$3 to \$5 per day to the hand. One man sunk 80 feet and found wash gold, and is now going to drift the ground. Clear, Middle and Rock creeks are still being mined. It is probable that quite extended operations will be carried on before long where the new claims have been taken up on the river.

THEY have stopped boring in the well on Mrs. Langtry's land near Carson, where some ore was found. The quartz found later contained no silver, and those who made other locations near by are much disappointed. The last 12 feet was in very tough clay, and the hole being very small, the clay stuck to the sides of the drill and progress was not only very slow, but got slower every foot in drilling. Two heavy stringers of quartz were passed through and one wall of slate 20 feet thick, and work was stopped in clay.

THE owner of the Metropolitan foundry on Townsend street, near Third, has had to pay \$500 damages because the smokestack was so short that the smoke was a nuisance to tenants of adjoining buildings.

COAST coals for home use are now in better supply, but foreign grades are still scarce. It is expected that present prices for coal will be sustained for some months to come.

## Mines in the Southern States.

George E. Mills, who has been connected with mining matters on this coast for many years, has for the past five years been engaged in mining operations in Georgia, Alabama, Virginia and South and North Carolina. He has come back to San Francisco again and declares that any man who leaves this State to go to mining in the South ought to get six months in jail for being such a fool. He says good miners, and plenty of them, are to be found in Georgia and North Carolina who will work for 75 cents a day. Alabama is enabled to deliver iron out of the furnace at Birmingham for \$850 per ton, though it is not as good as the Pennsylvania iron. He counts the five years spent among the Southern mines as five years lost, for he never worked so hard to get so little money. Some of the gold ore in Georgia, which is generally very soft, will pay if worth only 75 cents per ton; and with men who will mine at 75 cents a day, and split cordwood for 35 cents a cord, they get their labor cheap enough. The mills they use are of the California pattern. There are two English companies mining in Montgomery county, Alabama, and one St. Louis Company is about opening a gold mine where the ore is only worth 40 cents a ton, but Mr. Mills can't see any profit in the speculation.

He says a number of Californians have gone to the Southern mines, but they do not stay. There are many better chances in this State, but Northern capitalists have been going down there and investing instead of coming here for gold mines. He met a number of old California mining superintendents in New York and thereabout, but most of them are sorry they ever left here. Mr. Mills says this coast is good enough for him, and he proposes to stick to the mines out here after this.

## Oregon Iron.

Although at one time it was expected that the Clipper Gap mines in California would continue to produce iron for many years, the unfortunate litigation, the disastrous fire, and other circumstances, combined to put a stop to the whole operation. This was the only attempt ever made on a large scale to make iron in this State, and the results were not such as to encourage others to make another trial. In Oregon, also, they did not have very good luck at the iron business, and the mines there have done little for some time.

Recently, however, active operations have been resumed by the Oregon Iron and Steel Co. at Oswego, and the company now has 175 white men and 150 Chinamen employed. The new furnace, 80 feet in height, with three ovens, 50 feet in height and 22 feet in diameter, for heating air for the furnace; the chimney, 160 feet high—all of firebrick and covered with quarter-inch boiler iron—and the brick hoisting tower, 80 feet high, are completed, and the foundry, engine-rooms, etc., are well along. The material is on the ground and the foundation ready for a foundry for casting iron pipe.

Work is begun on the stockhouse, which will contain a crusher and bins for 5000 tons of ore and 3000 tons of limestone. One hundred and seventy-five thousand dollars has already been expended and \$150,000 more will be required to complete the works now planned. The company is opening a new mine 800 feet south of the old one. Owing to delays in receiving machinery and material from the East, the furnace and pipe foundry will not be in operation before July 1st.

THE Supreme Court has affirmed the decision of the lower court in the case of Joseph Byrne, executor, vs. Julia S. Reed et al. The action was brought to remove an alleged cloud on the plaintiff's title to certain mining claims situated near Iowa Hill, in Placer county. A demand for a new trial on the ground of the discovery of new evidence had been denied, and this denial the Supreme Court now sustains.

SENATOR STEWART has introduced a bill relating to the depositing of gold and silver bullion at the mints or assay offices of the United States. It is intended as an amendment to Beck's bill, which provides for the retirement of the United States legal tender and national bank notes of small denominations and for the issue of coin certificates in lieu of gold and silver certificates.

Academy of Sciences.

At the last meeting of the California Academy of Sciences, President Harkness stated that J. L. Young of Tahiti, at the request of J. Z. Thayer, had collected 45 varieties of fish, three specimens of crustacea, and one specimen of mollusk for the academy. These had been received from the island by Mr. Thayer, and were now presented by him to the society. In describing the fish Mr. Thayer said they came from the island of Tahiti, the coral-formed harbor of which abounded with hundreds of varieties of fish. The fish are of all the colors of the rainbow, and with the naked eyes can be plainly seen disporting themselves among the coral sprays and seaweed, many fathoms deep. Near the coral reefs the fish feed, and there the natives catch them.

Mrs. Mary K. Curran read a paper on "Comparison of the Floras of California and Chili." She said that Chili possesses a similar climate, though naturally its seasons are the direct opposite of ours. The unbroken coast line would at first glance seem to account in some measure for very numerous genera and species, either identical or closely related in the two countries. This line, however, leads through the tropics, where all our species and most of the genera disappear. Accepting, as most of us do, the Darwinian theory of the origin of the species, we can hardly bring ourselves to believe that in such widely separated districts parallel lines of evolution have resulted in the production of many identical or closely related species. The intervening tropics dispose very effectually of any possibility of progressive invasion. There remains to us the theory of communications. It has been the custom for some time to attribute the presence of certain plants along the coast to introduction in the wool of sheep, to cargoes of wheat and the hulls of ships. This brings us to the particular inquiry in which we are at present concerned, how did these plants scatter themselves in former ages? We shall have to interrogate the meteorologist, and ask him for a chart of the currents of air, the course and extent of great storms, the possibility of one little frolicsome wind after another carrying seeds and even plants in their course. We must learn also the length of time vitality remains in different seeds, when immersed in sea water, and the course of ocean currents. We must ask the migratory birds what seeds they carry adhering to their feathers or buried in their soft down. When these questions are satisfactorily answered we shall have made a fair beginning in our search.

Mrs. Curran then, by means of eight cards of mounted specimens, described in a technical manner the wonderful similarity of Californian and Chilean flora, and concluded her paper by saying: "In making this short notice I have wished to call the attention of botanists to the danger of naming species here without due consideration of such as may be found in other parts of the world, but particularly Chili. There are many persons who believe, or at least act as if they believe, that two plants or two insects found a few hundred miles apart are necessarily distinct."

By the recent decision of Secretary Vilas, the litigation over the San Chiquito rancho in Monterey county has come to an end, and the property is confirmed to Emory and Bassett. The present settlers upon the land had signed an agreement some time ago with the claimants by which they will now be allowed to purchase the lands at \$1.25 an acre. The coal mine and all mineral-bearing sections were reserved from this agreement, and the mine will now probably be thoroughly tested.

It is believed the Coal Mining Act before the British Columbia Legislature will not pass because of the feature proscribing Chinese from working in the mines. The Knights of Labor, it is asserted, threaten to tie up the mines by a strike if that clause is not included in the bill, and considerable anxiety is occasioned over the possible rise in coal if the threats of the miners are carried out.

The receipts of the Potosi mine last year were \$181,000, and disbursements \$209,216, but the mine is now producing bullion at a profit.

SAVAGE is expected to pay dividends very soon, as it is now producing about \$200,000 a month.

Mining Accidents.

By the explosion in the dry-house at the Empire mine, Nevada county, last week, S. O. Trebilcock and Wm. Sheils were both killed. There were six others injured.

Eli Daise was killed last week at the Angels mine, Calaveras county, by a rock falling upon him from the roof of the slope.

Wm. McFall, who worked in the Mt. Tmolus mine, Calaveras county, had his hand crushed last week while oiling the pump in the shaft.

John Holland and Stephen Williams were badly injured in the West Celusa mine, Meaderville, M. T., last week. By a mistake of the engineer in releasing the engine clutch, instead of putting on the brake, the cage, with the men in it, was dropped 225 feet. The men were seriously hurt, but not killed.

A sensational escape from death is reported

DYNAMITE AT THE PROVIDENCE WORKS.—On Friday night of last week a heavy blast was heard at Nevada City, and it was found that the pipe leading to the Providence mill had blown up. An attempt had been made the day before to blow up the mill. The bomb which exploded had been put into the water pipe and was intended to reach the Providence, but it exploded near the Champion shaft before reaching the former mine. Torrents of water, under a strong pressure, went pouring into the Champion shaft, carrying tons of debris with it. The attempt to injure the Providence Company no doubt originated from the decision of the company not to pay \$3 a day for wages as heretofore. Citizens of Nevada City have held an indignation meeting and are endeavoring to find out the perpetrators of the outrage.

F. M. Smith, who is manager of the borax companies of the coast, has gone to Washington

Wickes' New Gang-Mill.

The requirements in the general construction of the gang-mill as to strength and proportion of parts, kind and quality of material, are now so well known that a machine such as that illustrated herewith meets with prompt appreciation. A mechanism, simple and effective, to produce the easiest-cutting saws possible, is an important feature obtained in this new machine.

The mill is designed and termed by the builders as their No. 3 gang, and brought out to meet this demand for a smaller class of mills, retaining the valuable features of their former build, at the same time making it practical to simplify its parts and reduce its cost both in the machine itself and manner and mode of setting. The main or valuable features of this machine are outlined by its makers as follows:

First, simplicity; second, strength of parts, insuring great durability; third, a simple and effective oscillating movement, which presents the saw to the timber in such a manner as to cut under or against the grain during the entire half stroke, at the same time giving a perfect working in the up stroke, producing the easiest possible cut of saw, admitting the use of the thinnest blades with success. This plan also does away with all eccentric and crank motion to operate it, greatly reducing friction and the wearing of parts without adding extra weight to the shaft.

The extension of the iron frame through to the bottom of the foundation admits of its inclosure and forms a simple and substantial base or foundation at much less cost than is possible in the larger machines. This inclosed base is filled in with any weighty material, such as gravel and cement, clay, brick, etc., giving this weight necessary for anchorage, while the main crank shaft and pillow blocks are given support and solidity by the heavy iron columns reaching down to and resting the main anchor timbers below. The main pillow-block bolts reach down and bind the whole firmly together.

The main shaft is 8 inches in diameter, with crank and pin all forged as one piece, giving the greatest strength possible with a stroke of 14 inches. The main pillow block is especially strong and heavy. The main pitman of the new design is of great strength, and adapted to high speeds with safety. The framework or hales, containing press rolls, are so arranged upon hinges as to swing out and away from the saws, so that the work of hanging in the saws will be entirely unobstructed. H. P. Gregory & Co. are the agents for the Pacific Coast.

NEW IRON-FRAME GANG MILL.

from Ballarat. Michael and John Cullinan were sinking in the Young Sullivan Company's mine at a depth of 275 feet. They used an ordinary miners' bucket, with a "tail" rope attached. The signal was given to draw the bucket up, when Michael discovered that his ankle was entangled in the tail rope. His brother, in trying to release him, got his wrist caught between the rope and his brother's foot, and the two men were drawn to the surface, one being suspended by the wrist and the other by the ankle. Both were suffering intense agony. At about 50 feet from the surface the brakeman heard their cries and he stopped the engine, and they were thus suspended over the shaft 200 feet deep. Ascertaining the nature of the occurrence, the brakeman soon had them at the surface and released them from jeopardy.

The local iron market is very firm, and pig iron for shipment has advanced. Lead, copper, tin, zinc and spelter are also very strong. Stocks of tinplate are light. Quicksilver is quiet but no lower.

to endeavor to convince the legislators that the duty on borax and boracic acid should be maintained. In both the Randall and Mills hills cruds horax is placed upon the free list. Randall protects refined borax and boracic acid, with a slight reduction from the present rates, while the Mills bill makes all borax and boracic acid free. William Tillman, who is largely interested in the industry, obtains crude borax from Death Valley and San Bernardino and Inyo counties and from Esmeralda county, Nevada. Mr. Smith says if the duty on crude borax is removed, Congress might as well remove the duty on all the products of borax and the manufacturers in the United States would have to abandon the business. About \$1,000,000 is invested in the industry in California.

JUDGE FINLETTER of Philadelphia has ordered that Keely must show his motor. The plaintiff who secures the decision is Bennett Wilson, who has had a half-interest in the motor since 1869, but has been unable to inspect the invention.

MINING SUPERINTENDENT MURDERED.—Cyrus Gribble, superintendent of the Vulture mine, Arizona, and a young man named Johnson who accompanied him, were murdered while on their way from the mine to Phoenix with the bullion from the mine. The bodies were found near Nigger Wells, 32 miles from Phoenix. The express company some time since discontinued their office at Vultures, owing to robberies on the route. The men who murdered Mr. Gribble and Mr. Johnson stole the \$7000 in bullion that was in the buggy. The mine belongs to ex Senator Tabor of Colorado, and he has offered \$1000 reward for the arrest of the robbers and \$1000 for the recovery of the bullion. As this item is penned a letter lies on the writer's desk which was received from Mr. Gribble a few days since politely thanking the editor for some information furnished at his request. He was well known in Colorado, Australia and on the west coast of Africa, where he has been conducting gold-mining operations. He returned a short time since from a trip to London.

Since writing the above the telegraph informs us that Charles Doolittle was also murdered at the same time.

THE Hals and Norcross mines last year milled 3948 tons of ore which yielded \$119,760, of which \$55,817 was gold and the balance silver. From the several levels they hoisted last year 58,000 tons of waste, and ran 9233 feet of drifts. From the ore in the uprais in the north lateral drift they are now taking out 200 tons of good ore daily.

A NUMBER of miners were discharged from the Pittsburgh mill at Tinsboro last week because considerable amalgam was missing during their shift.

## MECHANICAL PROGRESS.

## The Intelligent Mechanic's Labor.

A group of gentlemen were discussing the necessity of brain labor in some life vocations, and after a lusion had been made to several well-known citizens who were successful and prominent in their professions, one of the speakers, himself a retired merchant and influential politician, declared that Blank, naming a draftsman and inventor employed in a large machine-tool manufactory, did more brain labor than any other man in the city. Some examples were cited of well-known mechanics, and the conclusion was reached that intelligent mechanical labor required as much solid thinking as any other way.

The intelligent, valuable mechanic is not a mere walking machine; materials are not always plastic; they are sometimes perverse, and judgment and calm consideration are required in their management. The parts of a machine, however closely planned, do not come together unaided and naturally, as eyesores converge in a saucer of vinegar; it requires headwork to "assemble" the parts of a machine of any kind, and nowadays, when mechanical work requires an accuracy of proportions and a nicety of dimensions such as were not dreamed of a generation ago, the mechanic who is not brainy in his line will surely get left.

The mechanic who thinks he has arrived at perfection may be written down as an ass. There is no such thing as "perfection" in the mechanical arts, and the man who claims to be a complete and finished mechanic knows in his heart he claims that which does not belong to him, and he will soon discover that his vanity, or his fraudulent pretenses, do not deceive the employer to any great extent. Blow and bluster will not make good work, or pass for efficiency, and the man who uses those sort of weapons seldom deceives an employer. "I never employ a man who knows it all," said a large contractor. "Give me a modest, neat-looking man," he continued, "and I'll hold you a dollar he is a good workman, and one that may be relied upon, though, of course, that sort of man seldom comes in search of employment. Braggings fellows, who state they can do anything, from dressing a board to designing and building a cathedral, are quite numerous, and may be had at any moment." Doubtless that is true, but it does not argue that there are not many of the modest workmen. There are plenty of them, good, reliable fellows—fellows that seldom or never have need to seek employment. They are always engaged. Most of them own their homes, are intelligent chaps, models in their own neighborhood, the best of citizens, have neat, thrifty wives and healthy, happy children, and their country is proud of them, for it understands that they are towers of strength and bulwarks of true freedom. It is not from this class anarchists or noisy demagogues are drawn; they do nothing until they have first considered the results, and all their actions are tempered with wisdom; hence their ability to become good mechanics.—*Exchange.*

"PURE" STEEL.—When steel is subjected, as in a fire-box, to sudden and great changes of temperature, the tendency to crystallize and crack is in direct proportion to the quantity of impurities present. If the steel has nothing in it but pure iron and carbon, it might be heated and cooled almost indefinitely without changing its structure. Phosphorus is by all odds the greater enemy of steel, especially if the latter be subjected, as in a fire box, to the extreme limits of temperature that accompany heating and cooling. Its vicious tendency is enhanced by heating and cooling, and it exercises a greater influence than all the other impurities together. Silicon, if as low as .015 or .02, and manganese, as low as .35, have apparently no influence for good or evil practically; sulphur is never present in good boiler steel. Surface finish or great smoothness in boiler steel is no criterion that its quality is good. In fact, if the manganese be almost entirely eliminated, pitting is sure to occur under the process of rolling. A pitted sheet, therefore, indicates pure steel.—*National Car-Builders.*

THE SAFETY LIMIT FOR BELTING.—Those who have the practical management of factories will find the following of value. It is a settled fact in mechanics that no piece of machinery, whether it be a belt, shaft, or gear, should ever be submitted to a strain greater than one-half of its breaking strength; it follows that a belt to be lasting and durable should not be submitted to a strain greater than 100 pounds to the inch in width. It is also an established fact that a leather belt passing over the face of a turned cast-iron pulley embracing one-half of its circumference, will give a fractional force equal to 40 per cent of the stress, so that if a belt one inch wide is passed over the face of an iron pulley embracing one-half of its circumference, and subject to a stress of 100 pounds, the fractional or driving power will be 40 pounds. If this force of 40 pounds is carried forward at a speed of 1000 feet per minute, it is evident that this force will be equal to 40,000 pounds at one foot per minute.

HITTING THE ANVIL.—A writer in the *Manufacturers' Gazette* writes upon the blacksmith's habit of hitting the anvil while at work as follows: Some time ago I read a short article con-

demning this peculiarity of blacksmiths in general. I showed it to a friend of mine, an expert in the trade, asking his opinion of the article. He explained to me that a blacksmith, in striking the anvil, when working alone, did so to rest his hand. Also it enabled him to think if he had time to look at the work a second or so between blows. Aside from this the habit admits of changing the position of the hammer-handle in his hands, and withal is a great relief to the smith. We all know how a blacksmith instructs his helper by striking on the anvil to indicate his wishes.

## Rotary Steam Engines.

The problem of getting an efficient and durable rotary engine is a most interesting one, and the peculiar advantages of great compactness and simplicity to be had in engines of this class make it a most desirable object to attain success. Most rotary engines consist of a cylindrical case or shell, inside of which revolves a smaller cylinder on a central axis or shaft; but the vital point is to have proper provision for the peripheral projections of the revolving cylinder to easily pass the abutments, against which the live steam bears to force the cylinder around.

In a recent improvement in this line, which is owned by A. W. Billings & Co. of Larned, Kan., provision is made whereby prompt and positive movement of the hinged heads or abutments is secured, so that the projections from the revolving drum can pass clear and the abutment be shut down steam-tight immediately after, so that the steam then admitted will act. There are two abutments disposed diametrically opposite, while on the steam drum there are three projections in triangular relation, so that there is not a moment of time in which there is not a full head of steam pressure in the cylinder and consequently no dead points. The positiveness of action is secured by having outside the shell, upon the shaft, a cam plate having in its plane, near the edge, a cam groove, whose conformation is at three places the arc of a regular circle, intercepted by three grooved arcs of a smaller circle. These arcs are placed in triangular relation to correspond to the three projections on the inner revolving drum, and the cam plate is keyed upon the shaft in such relation that the short arcs act upon a projecting bent stem, which extends outward from the abutment hinge and enters the cam groove. By this it will be clearly seen that the action of the parts is uniform and positive, and that there can be no knocking or wearing. The bent stem that terminates in the cam-groove plate can be applied with an anti-friction roller.

A practical rotary steam engine would be a most valuable invention and largely economize the use of steam.

AMERICA GOING AHEAD OF BRITAIN AS A PIG IRON PRODUCER.—Great Britain in 1877 produced 6,608,664 tons, and in 1886 6,870,665 tons of pig iron, an increase of 262,001 tons, equal to 3.96 per cent. The United States produced 7,187,206 tons of pig iron in 1887, which shows an increase of 145 per cent of the yield of the previous year. Germany showed an increase of 134.92 per cent; Austria-Hungary, 51.59 per cent; Belgium, 48.04 per cent; and Great Britain, 3.96 per cent. On December 31, 1886, there were 857 furnaces in the United Kingdom, and of these only 377 were in blast. This gave 480 out of blast, a number which, if employed, would have been amply sufficient to have maintained England's position with her foreign competitors. In steel this country also shows a most gratifying increase. The total output for 1887 was 3,739,760, an increase of 30 per cent over the product of 1886. Of this total all but 451,403 tons were Bessemer steel. Our production of Bessemer steel, as compared with that of England and other European countries, is alluded to by Mr. James Neilson, an English writer, who, not content with illustrating the decreased make of pig iron in England, says: "I would call the attention of the Scotch steelmasters to the world's production of Bessemer steel in the past 10 years, and would ask: 'What did they find?' In 1877 the United States produced 500,524 tons; in 1886, 2,026,062, an increase of 1,525,538 tons, equal to 304.78 per cent. Germany in 1877 produced 391,110 tons, and in 1886 1,185,000 tons, an increase of 793,890 tons, equal to 202.98 per cent. Russia, in 1877, produced 40,000 tons, and in 1886, 270,000 tons, an increase of 230,000 tons, equal to 575 per cent. Great Britain, in 1877, produced 750,000 tons, and in 1886, 1,570,256 tons, an increase of 820,256 tons, equal to 109.43 per cent."

POWDERED COAL AS FUEL.—The efforts to use powdered coal for fuel which were made on an extensive scale several years ago seem to be still exercising the minds of steam-users. A public test took place at the Cheater Rolling Mills at Chester, Penn., last week, of the device for saving fuel and improving iron invented by J. G. McCauley. The process consists of the spraying of fine coal, reduced by the Cyclone pulverizer to a powder, into a chamber attached to the furnace, in which the combustion is so perfect that all the waste hitherto occurring in smoke and ash is entirely obviated. The general result, it is stated, showed a saving of between 40 and 50 per cent of coal, a saving of 50 per cent in time of heating the furnace and a greatly improved quality of iron.

## SCIENTIFIC PROGRESS.

## What is the Soul?

The editor of the *Phrenological Journal* answers the above query put by a correspondent of that journal as follows:

If by the "soul" you mean the spiritual part of human nature, we frankly answer that we do not know. The philosophers of ages have been trying their best to unravel the mystery, but in spite of their immense tames of discussion they have not reached a definite and satisfactory conclusion, as you will see by consulting any standard work on intellectual philosophy or moral science. One of the students at the recent session of the institute, Mr. N. N. Riddell, after listening to the writer's lecture on the relation of moral faculties to the physical powers, wrote out the following opinion, which is about as near to the truth as any of us usually get when we attempt to explain the essence of the psychological attributes:

*Soul* is the eternal, all-prevailing force from God Himself.

*Life*.—Soul acting in connection with organized matter.

*Mind*.—That which is evolved from an organized brain by the action of soul on the organization.

These three qualities, soul, life and mind, constitute the immaterial man. One of the objects of this combination of soul with matter is to develop and (so far as possible) perfect an individuality, an ego. If the organization becomes unbalanced in any of the several parts, its manifestations become abnormal or diseased, and, if this disturbance be in the brain, improper manifestations of mind are the result, because brain is the organ through which the life principle manifests mind. And when this disturbance becomes sufficient to destroy the connection or combination between the vital spark or soul and the organized body, the phenomena known as life ceases; and as mind is but the result of the co-working of soul with an organized brain, it follows that when they cease action, mind, as it is known here, ceases also. Now, this individuality, this ego, that has been developed by and through the action of soul in connection with the highly organized brain, when released from its material habitation, severed from matter, still retains its individuality, and this released individuality I call spirit.

## The North Pole.

It has often been said that the desire or ambition, as it may more properly be called, to reach the North Pole will never abate so long as those who wish to engage in the enterprise can raise the means to carry out their projects, perhaps not entirely visionary, for that there is a North Pole, is beyond a doubt. The question is, after the explorer arrives there—if he ever succeeds in his venture—will he find an open sea? This is a question which perplexes Arctic navigators, and while they entertain the belief that such an open sea does exist, how are they to reach it? The many expeditions that have been fitted out to make the discovery have proved failures. Many brave men have lost their lives in the attempt; and yet this goes for nothing with those who have their hearts set upon the enterprise.

The latest adventurer in this direction, as has already been announced, is Col. Gilder, a representative of the *N. Y. Herald*. The Colonel has already had much experience in northern latitudes. He was a companion of Lieutenant Sohawka in his search for the relics of Sir John Franklin. He was also on board the Rodgers when she was destroyed by fire on the north coast of Siberia. He has had much other experience in northern research. His present plan is quite novel. He fits out no expedition, but takes passage at New London, Conn., on the northern whaler *Era*, which will land him at a point on Cumberland inlet, whence "he hopes by a bold dash to reach the most northern latitude that has yet been touched, and, if possible, plant the American standard on the point geographically known as the North Pole." The Colonel will not be hampered by any instructions whatever. He and his party will live on fish and game. If fish and game can be procured, all very well, but as there is no certainty of this, the fear will be entertained that, with all his confidence, Colonel Gilder has no greater promise than had his predecessors, who, in their explorations, practically accomplished nothing toward reaching the North Pole.

A NEW GAS.—The discovery of a new gas is reported in Germany by Dr. Theodore Curtius, who has succeeded in preparing the long-sought hydride of nitrogen, amidogen, diamide or hydrazine, as it is variously called. This remarkable body, which has hitherto baffled all attempts at isolation, is now shown to be a gas perfectly stable up to a high temperature, of a peculiar odor—differing from that of ammonia—exceedingly soluble in water, and of basic properties. In composition it is nearly identical with ammonia, both being compounds of nitrogen and hydrogen.

QUICK TRANSIT—AHEAD OF THE PNEUMATIC TUBE.—A company is being formed in Baltimore to construct an electric railway, which will, if successful, entirely revolutionize the express business and the transportation of

letters. A light elevated railroad structure, double tracked, 20 feet above ground, is projected, on which cars pointed at both ends are in run. In the center of the tracks is to be an upper rail, which will guide the cars and prevent derailment, as well as conduct the electric current which is to form the motive power. A system of automatic brakes is provided, by which the momentum of the cars will be checked as they approach their destinations. By this means it is claimed that packages can be carried from New York to Chicago in two hours.

A NEW IDEA.—A recent report of the House Naval Committee says: "We have absolutely no auto-mobile torpedoes. Our system of submarine mines or stationary torpedoes has reached a considerable degree of perfection, but a hostile fleet, protected by its armor plates from our shore batteries, could, with impunity, by means of auto-mobile torpedoes, blast its way through all such obstructions. We are, therefore, absolutely helpless against an invasion from the sea, so helpless that we should hesitate to publish the fact to the world were it not already everywhere else better known than to the people of America." The committee further says that the "United States has not now a single torpedo boat or torpedo catcher, and our Government does not now own one auto-mobile torpedo."

THE "HUM" OF THE TELEGRAPH WIRE.—Most people have noticed the incessant hum of the telegraph and telephone wire. It may always be heard by placing the ear against a telegraph post. What causes it is a matter that has never been satisfactorily explained. It is heard nearly or quite as strong in a perfect calm as in a strong wind. When secured to house-tops, these sounds are sometimes quite disagreeable; and it may be useful to know that the noise can be easily and simply stopped by a short length of india-rubber tubing fitted on the wire at its attachment. The plan was suggested by Sergeant-Major Buck, R. E., and introduced on the Southern Postal Telegraph district. Loose yarns may be used in place of the rubber tubing with very good success.

THE IMPROVED PHONOGRAPH.—Edison's new phonograph, improved in essential particulars since the original machine was supposed to be complete, is now in course of manufacture, and will soon be put on the market. It is briefly described as nothing more in principle than what is known to mechanicians as a lathe of precision turned by an electric motor. By the vibrations of a diaphragm, all sounds are distinctly repeated at the rate of 80 words a minute. It will do away largely with the service of stenographers, at least as amanuenses, and though designed for commercial and mercantile purposes chiefly, can be applied to other uses.

ELECTRIC LIGHTS IN COAL MINES.—More than 2000 electric lamps are now in use in the coal mines in England. It is many years ago that it was suggested that coal mines should be lit by electricity, but the use of portable lamps for this purpose has only recently been introduced. There is a disadvantage attending the use of incandescent lamps in mines, inasmuch as they offer no indications of the presence of fire-damp.

THE LOCOMOTIVE IN THE ARCTIC ZONE.—The first train to pass the Arctic circle passed the line on the Lulea railway recently. This most northerly railroad in the world runs up from the Swedish port of Lulea, at the head of the Gulf of Bothnia, into Swedish Lapland, within four miles of the Gellivara mountains, famous for their yield of iron ore. The works were begun 27 years ago, and then were given up until quite lately.

METALLIC PENS NOT OF MODERN INVENTION. At Acosta a Roman metal pen has been found. It is a bronze pen slit in exactly the same fashion as the present steel pen. The Dutch invented a metal pen in 1717, but it was not until many years later that the hand-screw press, which made the first cheap steel pen, came into use.

SILICUM COPPER ALLOY.—The new alloy of copper and silicium is said to be as good as gold for all purposes of ornamentation and better for many other purposes. According to the proportion of silicium in the mixture, the alloy is malleable both when heated and at ordinary temperatures. It is described as having the color of virgin gold.

IMPROVEMENT IN ROLLING SHEET IRON.—An invention has been introduced in English mills by which plate and sheet iron can be rolled perfectly level and save re-rolling for that purpose. It is a very valuable for sheet iron, which rolls crooked despite the best workmanship.

DYNAMO-ELECTRIC AND MAGNETO-MACHINE. A dynamo-electric machine furnishes a current which excites its own field magnet. A magneto-electric machine is provided with field magnets formed of permanent magnets, or with magnets excited by a current from another machine.

A MERCURY PLUMB BOB has lately been made. It consists of a small steel rod, bored out and filled with mercury to give weight.

## USEFUL INFORMATION.

**COUNTERFEIT JEWELS.**—Artificial precious stones have become an important article of trade. The products of some of the shops would almost deceive an expert, but the test of hardness is still infallible. The beautiful "French paste," from which imitation diamonds are made, is a kind of glass with a mixture of oxide of lead. The more of this latter the brighter the stone, but also the softer, and this is a serious defect. The imitation stones are now so perfectly made, and are so satisfactory to those who are not very particular, that their influence begins to be felt in the market for real stones. By careful selection of the ingredients, and skill and manipulation, the luster, color, fire and water of the choicest stones are to the eyes of the layman fully reproduced. There are few delicacies of color that cannot be perfectly given, for they depend on some undetectable peculiarities of molecular arrangement, and not on chemical composition; but the persons who buy the stones know nothing of that. Yet Sidot, a French chemist, has nearly reproduced these peculiarities, including the dichroism of the sapphire, with a composition of which the base is phosphate of lime. Two other French chemists, Fremy and Fell, have produced rubies and sapphires having the same composition with the genuine ones and nearly equal hardness.—*Popular Science Monthly.*

**CHINESE PAPER MILLS.**—There are several paper-mills at Tonquin. One is at Haoui, and produces most of the home-made paper of those regions. The hands—there are both male and female—are paid at the splendid rate of from two and one-fourth cents to five cents per day. The raw material is the bark of an indigenous tree growing in the forests. The process is most curious. The bark is steeped for some days, and then treated to a bath of milk of lime; it is next steamed in bundles during several days, after which the outer bark is cut off with knives. The mass is then beaten to pulp in stone mortars. This pulp is thrown into water made gummy by macerating therein a species of wood called go. When the pulp has lain in this water for some days, it is put into the vat. A kind of trowel or whatnot is introduced a little below the surface of the pulp, shaken about a little, and—there you are, the sheet is formed. The sheets are placed one upon another; when sufficiently drained, they are stove-dried.

**THE CHINESE WALL.**—For years the public has been treated at intervals to mathematical demonstrations of the enormous outlay of labor involved in the building of the famous Chinese wall, only to be told the next day by somebody else that there is, in reality, no such wall in existence, nothing but a few patches of a very cheap sort of earthwork faced with rock, imagination doing the rest. We have lately, however, the statement, which appears quite reliable, of an American engineer, who has made the subject a special study on the spot. He has calculated that the Chinese wall is a solid stone structure, and that it has an aggregate of 6,350,000,000 cubic feet. The material used in the construction of the wall would be sufficient to build a wall around the globe six feet high and two feet thick. The stupendous work was constructed in the comparatively short period of 20 years, an innumerable multitude of laborers being constantly, during that time, engaged upon the work.

**TEA CULTURE IN INDIA.**—The extent to which tea production is being transferred from China to India and Ceylon appears from a statement prepared by an officer of the Imperial Maritime Customs at Shanghai. The deliveries last year of China teas comprised 134,236,000 packages, which is a decrease of 23,800,000 compared with 1886-7. During the same period India teas increased to 75,425,000 packages from 48,285,000 in the previous year, and the tea product of Java more than doubled. The current year promises even more striking results. India and Ceylon enjoy the advantage of entire freedom from taxation, which operates as a strong stimulus to tea culture.

**VARIOUS WAYS.**—There are several effective means of taking out grease spots. Chloroform will do it. So will a mixture of alcohol and ammonia; or you can wet the place with ammonia water; then lay white soft paper over it, and iron with a hot iron. Or rub French chalk on the wrong side; let it remain a day, split a visiting card, lay the rough side on the spot, and pass a warm iron lightly over. Or try the old-fashioned "grease bills"—a stiff paste made of fuller's earth and vinegar, molded into balls and dried, wet the spot, scrape the ball over it, let it dry, and then wash it off with tepid water.

**INCREASING DEMAND FOR PATENT FUEL.**—The *London Iron and Steel Trades Journal* remarks that the utilizing of dross and culm to make patent block-fuel is an extending industry, and there are now a very large number of factories in operation. The word "waste" will soon have to be erased from the dictionaries of iron, steel and coal masters.

**LEAD PIPES FOR WATER CONDUIT.**—The decision as to lead pipes for water transportation seems to have resolved itself into this conclusion, viz.: that water simply traversing lead

pipes without standing in them cannot take lead enough to be poisonous in any degree, especially if the pipes are old ones, on account of the solid crust which forms on their inner surfaces. It is recommended, however, to paint the interior of new pipes with a layer of some mixture which prevents immediate contact and renders crust formation easier.

**HOW TO CLEAN HUCKSKIN.**—If it is not too much saturated with grease and dirt, huckskin can be cleaned with pipe clay. If it requires further cleaning, use the best of soap and water made into a lather. Apply with a stiff brush, but do not tug or stretch the garment. When the dirt is all removed, work the skin in the hands until perfectly dry. The Indians use a mixture of hains and water beaten into a stiff paste to clean huckskin, and then it is worked by hand until dry, when the skin becomes as soft and pliable as velvet.

**POLISH FOR PIANOS.**—Polish or varnish suitable for polishing pianos is made as follows: Take 700 parts of alcohol, 15 parts of copal, seven parts of gum-arabic, and 30 parts of shellac. The resins are first pulverized and bolted through a piece of muslin; the powder is placed in a flask, the alcohol poured over it, and the flask corked. By putting the flask in a moderately warm place, the solution will be accomplished in two or three days. It is then strained through muslin and kept in hermetically sealed bottles.

**MATERIALS FOR SOAP BUBBLES.**—The following recipe will make a very superior soap-bubble mixture, such as are used in scientific experiments: Take shavings of pure white castile soap, place them in a bottle, and fill with warm water. Shake occasionally for a few hours, and allow to stand over night. In the morning pour off the clear liquid and add to it nearly an equal quantity of glycerine. The bubbles blown from this mixture will be of surprising size and beauty.

**SOIL DRAINAGE IN ILLINOIS.**—It is said that tile enough has been laid in Illinois to reach three times around the globe, costing between \$10,000,000 and \$15,000,000; and the experiments of the Illinois University professors go to show that the best crops are found in the best drained soil.

**A PERMANENT BLACK ON ZINC.**—"Bluestone" dissolved in water with blacken the surface of sheet zinc so that it will not rub off. Wetting the surface of the zinc and rubbing the bluestone over it will have the same effect.

**RUST.**—Articles of iron or steel that have been immersed in a solution of carbonate of potash will not rust for years, even when exposed to damp atmosphere.

## GOOD HEALTH.

## "Nerve Waste."

Dr. H. C. Sawyer, a member of the Medical Society of the State of California, has written a treatise of 100 pages on nervous impairment. He uses no technical terms, but presents his views in a plain and direct way. He exposes many popular fallacies on the subject of remedies. Nerve foods and nostrums find no favor with him. The two things that do find favor are rest and fresh air.

Nervous impairment is traced to such causes as arise from without, as environment and heredity, and overwork and dissipation. Out of life is one of the most approved remedies. Nervous people are apt to exaggerate the meaning of all unfavorable symptoms, and by reason of great depression of spirits fear the worst consequences. "Thousands of medical vipers do all in their power to cultivate this wretched nerve, and derive large incomes by playing on this phase of nervous impairment." Neurasthenia is the national disease of overworked people in this country. These suggestions are worth noting:

Coming now to actual facts, the fats stand highest on the list for the nervous—cream, fresh butter, the fat of roast beef and heststeaks; the brain is rich in fatty substances, and fat goes to make heat and force. Fats, while highly nutritious to the nerve, are not so easily digested as lean meat, but, by keeping up his oxygen, the nervous invalid will find himself able to manage more and more of these substances. I am aware that nine men in ten who read this book probably abhor fat meat, but I advise each to begin with small quantities and cultivate a taste for it.

Next in value to the fats are the unboiled cereals; first of all, wheat, then oats and corn. Cracked wheat and cream is an ideal nerve food. Cornbread, the "johnny-cake" of New England, made of cornmeal, eggs and flour, thick, light and warm, and soaked with fresh butter, is a better nerve food than can be found on the druggist's shelves. Roast beef or juicy steaks are rich in the elements of brain nutrition, the phosphates of lime and soda, and the fats, besides yielding a larger amount of force to the household than any other food. The preparation of phosphorus that are put up by the Creator in such inimitable packages, in the germ of wheat, oats and corn, and in meats, have great advantage over the artificial products of the laboratory; they are more easily assimilated by the tissues because they are natural. Fresh fish and shell fish are light, easily

digested food—when properly cooked—but they have no special value as brain and nerve foods. Celery, I may remark, since I have been asked so often concerning it, has no value whatever in nerve nutrition.

**A CURE FOR WRINKLES.**—Wool fat or agnane is made from the wool of sheep by subjecting it to an alcohol treatment. By this process a yellow grease is precipitated chemically identical with an element found in the human bile and in certain vegetables such as peas and beans. This grease has recently been found to have one very peculiar property which was accidentally discovered by Dr. Morton Prince of Boston. When applied with rubbing it passes directly through the skin, and in this way acts as a nutrient to the fatty tissues beneath. Thus it has the effect of smoothing out the wrinkles produced by the attenuation of these tissues which comes with age. An antiquated lady has nearly removed from her temples the unwelcome footprints of a thousand figurative crows by six weeks' use of it. Dr. Prince has also used it with success in other cases, and it has created a sensation in Boston.

**GOOD HEALTH OF BRAIN WORKERS.**—Symmetrical brain development is an essential factor in a perfect constitution no less than muscular development. In fact, brain-workers average much the longest lives, in spite of the fact that they are apt to slight the muscular system. It is a commonly received notion that hard study is the unhealthy element of college life. But from tables of mortality of Harvard University, collected by Prof. Pierce from the last triennial catalogue, it is clearly demonstrated that the excess of deaths for the first ten years after graduation is found in the class of inferior scholars. Boating and baseball—to say nothing of the convivial temptations associated with them—will not only fail to give the world educated men; they will fail to make even healthy ignoramuses.

**APOTHECARIES' LATIN.**—A Berlin cotemporary informs its readers that the famous surgeon, Dr. Esmarch, is the leader of an attack upon "apothecaries' Latin," and he is supported in this campaign, on behalf of common sense in medicine, by several of the most eminent physicians and medical professors in Germany. He asks why a foreign tongue should still be employed by physicians in writing their prescriptions when a general expulsion of foreign terms and phrases and the substitution of their German equivalents has become the order of the day. A pharmaceutical lexicon is being prepared for the use of doctors and chemists as to assist them in prescribing and making up prescriptions in the tongue understood by the people.

**FOR POISON OAK.**—Among the many remedies for curing poison oak, the following is said to be an excellent remedy, and may prove of service to some of our readers: Dissolve one ounce of gum-shellac in six ounces of sulphuric ether; work tightly in a bottle. Bathe the surface where the irritation appears with cold water and wipe dry; then apply the above solution. The ether will evaporate, leaving an elastic coating of gum, impervious to the air. In about two minutes the most distressing case of poison oak can be relieved entirely of all unpleasant sensations. As the coating peels off, apply more of the solution, and in 24 hours the cure is performed.

**ONE WAY TO RESIST COLD.**—When exposed to severe cold a feeling of warmth is created by repeatedly filling the lungs to their utmost, with the shoulders well back and slowly (the garments being loose), the air entering entirely through the nose. When the lungs are completely filled, hold the breath for 10 seconds or longer, and then expire it quickly through the mouth. It is important for all to practice this exercise many times each day, especially in the open air. If this habit ever becomes universal, lung diseases and many others will rarely be heard of. A permanent expansion of the chest of one, two, and even three, inches will eventually follow.

**HOUSE POISON.**—If the condensed breath collected on the cool window pane of a room where a number of persons have been assembled has burned, a smell as of singed hair will show the presence of organic matter; and if the condensed breath be allowed to remain on the windows a few days, it will be found, on examination by a microscope, that it is alive with animalcules. The inhalation of air containing such putrescent matter causes untold complaints which might be avoided by a circulation of fresh air.

**RELATIVE VALUE OF THE DIFFERENT PARTS OF THE HUMAN BODY.**—According to Rundschau (Prag), the following table has been constructed for the workmen's society in Leipzig, showing the percentage value of different parts of the human body: Loss of both eyes, or arms, or hands, or legs, or feet, represents 100; loss of right hand, 40; of the right thumb, 33½; of one eye, 22; of the left thumb or right index finger, 14; or left index, and any other finger of the left hand, 4 per cent incapacity to gain a living.

**THE REMOVAL OF WARTS** is easiest effected by means of caustics, such as silver nitrate or nitric acid.

## ENGINEERING NOTES.

## A Cable Road With No Grip.

A cable road now being constructed in Newark, N. J., is attracting much attention from railroad engineers and owners of street-car lines in various parts of the country. The plan is novel, chiefly in having no grips on the cars and no stationary pulleys in the conduit. There are other striking features, however, and as a road of this kind has never been built before, except upon an experimental scale, railroad men are deeply interested in the trial. The erection of the road upon which the plant has been laid is about 8000 feet long, with several hills and hollows. The conduit, which lies midway between the rails, is constructed of rolled iron in lengths of 30 feet, and its inside dimensions are only 6 inches in width and 7 inches in height.

The conduit is furnished with two small tracks upon which two-wheeled trucks run and carry the cable. These trucks are formed of hollow cast-iron boxes containing oil, through which the axles run in vulcanite bushings. At intervals of five feet throughout the length of the cable, hollow buttons of malleable iron are firmly pressed upon the wire rope in halves and riveted together. The hollow spaces in the buttons are filled with type metal, which takes the form of the strands and secures the buttons so that, it is declared, the cable will break before one of them can be detached. The buttons go upon the cable in pairs, placed eight inches apart, and the carrying trucks are loosely hung upon the cable between the two buttons. When in position the trucks are five feet apart and can move freely around the cable. In going on a level or up-hill these trucks are supposed to run almost noiselessly upon the two tracks on the bottom of the conduit. On a down-hill section or in a hollow the tracks are placed on the top of the conduit as well as on the bottom, and the trucks are lifted a quarter of an inch and engage with the upper tracks. On curves, cast-iron sections of the conduit are provided with tracks which incline in due proportion to the radius.

The care will be provided with thin sprocket-wheels of steel, which will be dropped through the slot and be revolved freely by the buttons on the cable, while the car is standing still. When it is desired to start a car, the ordinary brake-handle, on the front or back platform, is turned to the left. This winds up a chain which brings a strap-brake to bear on a flange on the hub of the sprocket-wheel, and brings the wheel gradually to a rest, while one of its teeth engages with a button on the cable and the car is carried along. To stop a car the driver releases the brake-handle, and, turning it rapidly to the right, throws off the sprocket-wheel brake and puts the ordinary brake upon the wheels of the car.

The claim is made that this road will run almost noiselessly, and that a cable will last five or six years. Other cable roads must have new cables every year, but by this plan the wear of the stationary pulleys and the tear of the gripping apparatus are escaped.

## Noise on Railway Bridges.

The Government managers of the new city elevated railway in Berlin have taken a great deal of pains to diminish the noise of trains passing over the viaducts and bridges which form the principal portion of the road. The metallic structures employed in such places rattle and reverberate in a manner which is considered very suitable to the nerves of the people of New York, but which the Germans are not disposed to endure. In experimenting to find means for overcoming the trouble, it is found that the form of the bridge does not perceptibly affect the noise, a lattice truss, notwithstanding the multiplicity of joints, producing no more sound than a plate girder; but the length is a very important factor, so much so that the noise is considered by German engineers to be directly proportioned to the span of the bridge. Where the rails rest on wooden cross-ties, or on timbers running longitudinally, the sound is less than where they are secured directly to the metal, and it may be still further diminished by placing cushions of felt or rubber under the timbers before bolting them to the bridge construction.

To cover an iron bridge entirely with planking does not appreciably diminish the noise unless the planking is covered with gravel, a thin layer of which has a marked deadening effect, while still more improvement is obtained by thickening the layer of gravel about the track so as to bury the cross-ties or longitudinal timbers on which the rails rest. Profiting by these suggestions, the Berlin engineers have adopted two different systems for diminishing the noise of trains on their viaducts. One is to bolt to the bridge structure long troughs of sheet iron, about 16 inches wide, so arranged that a rail will come in the center of each. The troughs are then filled with gravel, in the middle of which is buried the longitudinal timber carrying the rail, and the space between the troughs is covered with iron plates on which is spread a thin layer of gravel. The second method, which is found to be more efficient than the other, consists in placing a continuous series of shallow iron troughs, about five feet square, along the line of the tracks. These are filled with gravel on which the ties and rails are laid.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**AMADOR GOLO MINE.**—*Amador Ledger*, March 17: Last week a large body of water was encountered in the west drift at a distance of 250 feet from the shaft. The flow of water was beyond the capacity of the machinery to control, and all work has been suspended since. It is supposed that this extraordinary increase of water is due to the drift coming in contact with the main ledge, and is consequently regarded as a most favorable indication. When the water was struck the flow was too great to admit of a careful examination of the ledge matter that was washed into the drift. The first day the water gained two feet, in spite of the drainage facilities being worked to their utmost capacity. It has been gradually reduced since, showing that it was merely an underground reservoir connecting with the ledge that was tapped. In a few days it is expected that the water will be again sufficiently under control to permit the resumption of work. The hoisting machinery over the south shaft was started this morning.

**SUTTER CREEK.**—*Cor. Amador Ledger*, March 17: Preparations for the erection of 10 more stamps at the Wildman mill are progressing as rapidly as possible. The patterns for the mortars are about completed, and in about another week the mortars will be cast and in a few days more they will be ready to be placed on the blocks. The mill is being run regularly and the rock that is being crushed is paying very well. There has been a cleanup at the Lincoln and the result did not come up to expectations. The four men who have a lease of it have discharged all of their hired help, and have concluded to do the work themselves and will only run 10 stamps. If the next cleanup is not better, in all probability they will close down entirely. Chas. Smith, one of the lessees, having received a good offer from Arizona as millman, has concluded to accept the offer and will start for Arizona in a few days.

**PLYMOUTH.**—*Cor. Amador Ledger*, March 17: It may be some time before there will be much doing in Plymouth Con. mines. The New London is apparently very prosperous and big things are expected of it by the people here. Supt. Cupps of the New Chicago M. & C. Co. has gone to San Francisco on business connected with the mine. Sinking is still going on at a lively rate and a mill is talked of. From all accounts the rock in sight would fully justify a good mill being put up. Mr. Etling has got through crosscutting on his claim known as the Mammoth, and he has commenced sinking again. He is very much pleased with the appearance of the lead so far as he has been able to examine it, and shows some very fine specimens of rock carrying gold and gold-bearing sulphurets in great abundance. Tom Bawden and the War Eagle Co. are still working and speak in glowing terms of their prospects.

## Calaveras.

**ANGELS MINING DISTRICTS.**—*Calaveras Chronicle*, March 17: The Matson mine, adjoining the Gold Cliff mine on the south, has been sold to Mr. Chas. D. Lane, who will erect a ten-stamp mill at once and begin operations in the mine. The Uica mine, owned by Hobart & Haywood, is running in full blast day and night and yielding good returns. The new hoisting works on the south are nearing completion as circumstances will permit. The stone foundation for the new engine is nearing completion, and it is expected the machinery will be in running order about the middle of May next. The Nevills mine is running full-handed and yielding good results. The ore now being extracted is taken from the 400 and 200 foot levels. The Angels mine is steadily pushing developments, both on the surface and underground, and everything is being put in condition for the spring and summer campaign. This is a very valuable property and we soon expect to hear of big returns. There is some talk of the Stevenot mine at Carson Hill falling into the hands of a wealthy English company shortly. The sum to be paid will range well up in the thousands.

## El Dorado.

**GOOD ROCK.**—*Mountain Democrat*, March 17: John Melton is certainly a lucky dog. About three years ago, a party at Grizzly Flats found some rich rock, and Melton, H. H. McClellan, and B. G. Parlow gave him \$50 for his find. It was afterward found to be nothing more than a large quartz boulder, and no work was done. Recently, however, Melton insisted on looking further into the same vicinity. A shaft was started and put down 50 feet on what was thought to be the ledge. One hundred tons of ore was extracted and crushed, paying \$800. At 50 feet the ledge is 2½ feet wide, and better rock in sight.

**SPECIMENS.**—We were shown some very pretty and rare specimens of gold Thursday last, from the Greenstone—Mother Lode. The specimens were pure gold and of crystallized formation. They were mined out by Fred Schuster, whose claim is located on the American river above Chili Bar. Mining men admit the rarity of this quality of gold, and having come from the Greenstone, the crosscutting of this famous ledge by the Big Tunnel Mining Co. will be watched with interest. Supt. McNeil tells us that this ledge will be tapped at 1600 feet.

**BIG TUNNEL.**—The Big Tunnel Co. are making an important improvement in their reservoir, by means of which the expense of running their air compressor will be reduced fully one-half. The tunnel is progressing rapidly and during the past week cut a vein five feet wide, showing free gold and iron pyrites. This is the second gold-bearing ledge that has been cut in the 230 feet.

**MILLING ORE.**—*Placerville Observer*, March 17: Ike Berson, who has been diligently at work on the Sandstone at Poverty Point for some months past, has on the dump, as a result of his labor, 50 tons of milling ore of fair grade. Mr. Berson has tested the ore and is so well pleased with the result obtained that he will keep adding to the dump until he has accumulated tons enough to give the Poverty Point mill a good paying run.

**LOOKING BETTER.**—The town has been overrun with miners and capitalists seeking investment in mines lately, and the mining prospects of the county

are looking better than for years. With the advancement of spring will come many more of this class, and they should be encouraged by all.

## Nevada.

**THE DELHI MINE.**—*North San Juan Times*, March 16: A report came from North Columbia Tuesday that another rich strike of rock, richer than ever, had been made in the Delhi mine, at a point, too, where it was not looked for. During the fiscal year ending Feb. 29, 1888, 7000 tons of rock were run through the mill, most of the time but eight stamps in operation, which yielded, on an average, \$21.24 per ton, or a total of \$148,692.27. Three hundred and eighty-one tons of sulphurets were worked up to March 1st, from which was realized the sum of \$85.64 per ton, or a total of \$33,628.94—making a grand total of \$181,321.21. The rock and sulphurets yielded in the aggregate \$25.90 per ton, on an average. The running expenses for the year amounted to \$33,409.83. During the year dividends to the amount of \$100,000 were declared and paid. During the year ten stamps were added to the mill, sulphurets works, boarding-houses and other buildings were constructed and many other improvements made, and to-day the mine does not owe a dollar. It must be remembered that all the rock taken from the Delhi is crushed, good, bad and indifferent. There is no picked rock nor any refuse rock; all passes through the screens.

**THE WASHINGTON MINES.**—*Herald*, March 15: The mines about Washington are all doing well and the people who come down from there are sanguine that the season is going to be a very prosperous one. The Washington mine has the new rock-breaker in place, which will enable the owners to work the rock at a reduced cost. The Yuba never looked so well as on the lower level. The shaft being sunk for the next level is showing the same quality as far as sunk upon—60 feet, and the superintendent says if it continues to the next level as good as now, the mine could not be bought for double its present assumed value. The Blue Bell grows better with each day's development. It is thought the Eagle Bird affairs will soon be in shape and that mine will be started up. Washington district is all right.

**MINE LEASED.**—W. J. Organ has leased his ledge on Deer creek, to John Murchie & Co., who are now at work. They have extended the old tunnel 30 feet and will continue it till they strike a pay shoot which is known to exist some 70 feet further in the hill.

## Placer.

**UPRA' SE.**—*Argus*, March 18: The miners at the May Flower mine started an upraise over a week ago, and it was expected to strike the channel some time this week. The tunnel is in 5200 feet.

**IOWA HILL.**—*Placer Herald*, March 17: H. L. Lightner was here last week on his way to the Pioneer quartz mine, recently purchased by Fair & Davis, to start operations, but the snow has postponed this work for a short time. Undoubtedly there will be active times here this summer in mining circles. We need it. There are no hydraulics running, except by Chinamen, and business is dull and not likely to be better until operations commence on the divide above us.

## Plumas.

**LA PORTE.**—*Plumas National*, March 17: Times are very quiet, but the outlook for the future is good. When the tunnel now being run taps the rich channel under Bald mountain there will be a "boom" what is a boom. The Claybank tunnel is being pushed ahead as rapidly as possible. The outlook for a water season is not very good, but there is plenty of snow, if we have our usual spring storms, to give us an average season.

## San Diego.

**OWENS.**—*Juan Sentinel*, March 17: Joseph Marks bought the Owens mine and mill at the sheriff's sale last Saturday. Consideration, \$4000. This amount covers the indebtedness.

**MESA GRANDE.**—A. P. Frary Jr., of the Shenandoah mine, Mesa Grande, was in town on Tuesday, looking up a crew of men for working the mine on a large scale. The mine is under the charge of Superintendent Farley, an experienced and practical miner, who will be assisted by the best force of men to be found in the district.

## Shasta.

**NEW MILL.**—*Shasta Courier*, March 17: The new five-stamp mill on Frank Wheeler's claim, French gulch, works to a charm. In 22 days from the time the machinery was shipped from the Mechanic Manufacture Works in San Francisco, the mechanic who came up with the machinery set the mill in motion, and every part of the outfit worked to perfection. The Texas and Georgia mine was bid in at sheriff's sale this week, on mortgage, by Rev. Flemming, for \$7700.

**LOADING MACHINERY.**—*Shasta Democrat*, March 17: The Calumet Gold Mining Co. will do no more milling until their water-power is completed. In the meantime they are adding more machinery to their already large plant, and fixing generally for reducing from 80 to 100 tons a day. Last week Louis Gross purchased 7 mining claims in Squaw creek.

**COPPER CITY AGAIN.**—Lem Williams of Copper City was in town last Friday, and seemed to be in high spirits over the latest developments at that camp. The company which has had a lease of the Winthrop mine for a long time back has turned the mine over to the owners, Stanley & Co., of San Francisco, and Mr. Williams was put in charge of the property. Lem also secured a lease which permitted him to prospect the mine for all the ore he could get out till he struck the main lead. Late last fall he struck a fine prospect on new ground near an old tunnel that was made many years ago, and following it up with an open cut took out several tons of rich float ore, and a few days ago struck the main body of ore which he believes is a veritable bonanza. The vein where encountered is 14 feet between walls, and at this place the ore shows "oodles" of horn silver and free gold—a large specimen of which we have on exhibition in this office. Mr. Williams believes he has struck a chimney, and the prospects are that it is a large deposit of very rich ore. The company will fully develop the new strike, and so confident is Mr. Williams of its richness and permanency that he firmly believes the resurrection of old Copper City is at hand.

## Sierra.

**THE KENTUCKY.**—*Tribune*, March 16: At this mine yesterday a cleanup of the four-stamp mill was

made after a run of 30 days. The amount of the yield has not been made public, but it is understood that it was sufficient to balance the expenses of running the mine. This is certainly very good considering the difficulties the management has had to contend against most of the time. It is expected that a much better showing will be made the ensuing month. Some very fine ore is being taken out of the raise above No. 2 tunnel. D. L. Whitney and L. Foss are pushing ahead developments upon their quartz claim, located between this place and Downsville.

**YOUNG AMERICA.**—*Mountain Messenger*, March 17: The Young America Co., this spring, as soon as No. 2 tunnel is extended through the mountain, will utilize it for carrying water from Packer lake site into Upper Sardine lake that supplies their mill with water, when crushing can be done the year round. Thirty stamps are running, and 110 men employed. Pay ore is expected at most any time in No. 3 tunnel that will tap the vein 870 feet below the present workings. The cleanup for 30 stamps for 18 days' run, last month, was \$12,700. Everything at the mine prospers under the able and economical management of Supt. Steven Moore, late of Grass Valley, Nevada county.

## Trinity.

**EAST FORK.**—*Cor. Trinity Journal*, March 17: We are still scattered some, for it is several miles from the first mine one strikes after leaving North Fork until the last one on the headwaters of East Branch is reached. Just how large a section of country is mineral bearing is hard to determine. The nearest mine to North Fork is the Ozark, about 5 miles away, and the most distant in the district is 6 miles above Rattlesnake, 30 miles from North Fork. A very small portion of the mineral belt is prospected. During the past winter more work has been done toward developing the different prospects than ever before, and when spring fairly opens the mines will be in a condition to ship some bullion. Day & Moor are steadily running their astras on rich ore taken from the Ozark. The Thanksgiving mine is doing a great amount of development work, and taking out ore; a tunnel is being run 6x7 feet in the clear to tap a large body of ore found the past winter; their astras are running day and night under the supervision of Mr. Smith of the Golden Chest. The Enterprise, under Mr. Jackson, superintendent, is showing up fine. Webfoot mine has proven to be one of the largest lodes in the district; the owners have a tunnel in on the ledge about 120 feet; in places the lode is 9 feet in width; judging from the amount of sulphurets and free gold to be seen in the rock, it will be a bonanza for the boys. The Fountain Head mine, owned by Frank Moor, is showing up well; some very fine specimens of rich ore are to be seen in the quartz on the dump. The only new discovery this winter, so far as is known by the writer, was on the Yellow Pine location; the lode being two feet in width, and estimated at \$50 a ton. The Golden Chest owners have done considerable work in the shape of tunneling to determine on the erection of a mill during the summer; very rich ore has been found in the different tunnels, leading to the belief that the mine is rightly named. The snow during the past winter did considerable damage to the different mines, and the high water afterward, sweeping away dams, ditches and roads, has caused considerable inconvenience. Mr. Al. Thurston showed me some ruby sand, great quantities of which are found mixed in the foot-wall of his mine. Mr. Thurston owns one of the largest sulphurets mines of East Fork.

## Tuolumne.

**QUARTZ ITEMS.**—*Sonoia Democrat*, March 17: Mr. Glasson and partner struck a pocket of \$400 in Saratoga hill last week. Judge Preston of Jamestown is making arrangements to build a mill on Blue Gulch. Quite a number of mining men are in Sonora at present, looking at Tuolumne's resources. Reports from the Platt mine say that a two-foot vein has been struck which is rich in free gold. The mine and mill of Soulsbyville, under the able supervision of Civil and Mining Engineer Shawwood, have been started under full headway. A lead has been discovered near Copperopolis by a Mr. Curtis, and last week he was offered \$5000 for the property, but he asks \$15,000. A. J. Lane of Knights Ferry has purchased the Madison property at Angels. It is estimated by experts that at least \$30,000 worth of ore is in sight. The lode is 40 feet in width. Mr. Jo Hampton and Mr. W. Long are operating the Cardinal mine at Tuttle-town, which 20 years ago gave forth nearly 200,000. It is reported that the Riverside mine above Columbia has made a fine development. Rich rock is reported to have been struck at a depth of 1200 feet. A long tunnel running in from the base of the mountain taps the lead at a depth from the top of that number of feet. The lead at that depth is said to be 50 feet in width. Mr. Fred Sutton, who is working his mine, the San Giuseppe, sent a bar of gold to the mint at San Francisco recently. The return certificate shows the gold to be 989 fine, or \$20.62 to the ounce. As \$20.67 is the value per ounce of chemically pure gold, and as the bar of gold was the result of common metallurgical treatment and had nothing in common with chlorination process, the fineness is remarkable. The reports from the New Albany mine indicate splendid results, and the appearance of the mine justifies the belief that the present developments are on the rich chute which was lost years ago. Some 200 tons of quartz are out on the dump, and Messrs. Long and Kirk are getting the mill and attachments in order, preparatory to crushing. The lead is now about 4 feet across, and gold is visible in nearly every piece of quartz.

**BLACK OAK.**—*Tuolumne Independent*, March 17: The Black Oak at Soulsbyville continues to develop rich. It bids fair to discount the old Soulsby mine. There is nothing black about it except its name.

**PLATT.**—The Platt mine at Soulsbyville, near the Raymond mine, is getting out rich rock, which will mill \$30 per ton. The shaft is down 120 feet from the surface, and the vein is improving as depth is attained.

**NEW MILL.**—J. R. Ritchie's new mill at Tuttle-town commenced running on Friday of last week. Everything moves like perfection, and the ore is believed will prove all that is expected of it.

## NEVADA.

## Washos District.

**BELCHER.**—*Virginia Enterprise*, March 17: The east crosscut on the north line is in 144 feet. The

ground passed through shows no change. The west crosscut is in 60 feet, the last 20 feet showing considerable quartz that assays from \$6 to \$14 per ton, and there is some water coming in the south side of the drift. It is the intention to run south on this quartz. The Suto tunnel drift is out 1310 feet.

**HALE AND NORCROSS.**—Since the last report the south drift on the 400 level has been advanced 40 feet, and have commenced stoping ore from this drift on the south boundary. The north drift on this level has been temporarily discontinued. On the 700 level the drifts north and south from the top of the upraise have been connected and show a continuation of the ore body between the two upraises. During the past month there was shipped and reduced at the Vivian mill 1200 tons of ore, which yielded about \$36,000. Are now shipping 130 tons of ore per day to the Mexican mill. The ore stopes throughout are looking well.

**GOULD AND CURRY.**—Have extracted 50 tons of fair-grade milling ore from the 250 and 300 levels, and stored the same in drifts during the week. On the drain tunnel west crosscut No. 1 from the main south drift has been advanced 39 feet; total, 59. This crosscut has passed through the old west stopes, and the face is now in low-grade ore. West crosscut No. 2, near south line, on this level, has been advanced 48 feet. This crosscut is in the old west stopes.

**BEST AND BELCHER.**—East crosscut No. 4 from the end of the main north drift, near the north line, has been extended 45 feet. The formation is quartz showing value. The upraise has been carried up 22 feet; total height above the track floor, 100 feet. The formation in the top of the upraise is quartz, giving better assays than the drift below.

**POTOSI.**—The south drift on the 930 level is in 406 feet. There has been no crosscutting on this level yet. The south drift on the 540 level is in 304 feet. The face is all in quartz giving low assays. The west drift (Belvidere) is showing fine-looking quartz.

**CROWN POINT.**—On the 500 level have stopped the north crosscut temporarily and started a winze from the 400 level south drift, 100 feet south of the raise from the 500 to the 400 level, intending to follow the ore. It is down 16 feet, all in very good ore.

**SAVAGE.**—During the past month have shipped and had reduced at the Mexican mill 416 tons of ore, which yielded in bullion \$81,086.26. Tuesday commenced shipping ore to the Rock Point mill, which started cr. h. yesterday.

**BULLION.**—Are cutting out a station at the head of the winze on the 500 level, and will put up a steam hoist over it to make extensive explorations at that point. An engine has been shipped from San Francisco.

**ANDES.**—The drift on the 350 level, which has been running east, has been turned northerly. The face is in good ore, and the prospect is flattering. It is expected to connect this drift with another at that point.

**ALTA.**—Are upraising in Lady Washington and sinking on the Keystone vein to meet the upraise from the 725 level. Running a south drift on the 825 level and a north drift on the 1150.

**SCORPION.**—On the 300 level the north drift is out 142 feet and the south drift 125 feet. When these drifts are advanced 30 feet further, crosscutting on this level will be commenced.

**CHOLLAR.**—The main incline has been timbered 48 ft. below the 900 level. Below this point the incline is open and only needs to be retimbered to the 1300 level.

**SEGREGATED BELCHER.**—The south drift from the raise is in 232 feet, having made 18 feet during the week. There is no change in the ground to report.

**UTAH.**—The incline upraise from the end of east crosscut No. 3 has been carried up 48 feet. This upraise is in east country rock free from water.

**BALTIMORE.**—Work progresses favorably in the northwest drift on the 350 level. Have not yet intersected the place where ore was found.

**YELLOW JACKET.**—Are shipping ore to the Brunswick mill, which is extracted from the 1200, 1300 and 1400 levels.

**IOWA.**—Work of repair on the 500 adit level progresses favorably, and work has been resumed in the face of the tunnel.

**JUSTICE.**—The usual amount of work is being done in this mine, and the extraction of ore continues.

**OCCIDENTAL.**—Have extracted 78 tons of fair-grade milling ore during the week.

## Aurora District.

**ANTELOPE.**—*Esmeralda News*, March 17: Hon. Horace Marden went to Aurora Thursday. His return to the old camp is said to be significant of the starting up of the Antelope mine. It is expected that the owners of that mine and the Silver Hill mill have consolidated their property and that the mine will be worked for all there is in it. There has been sufficient work done on the claim to demonstrate that it is a good one. The vein though of low grade is amply made up for in its size, strength and the free-milling character of the ore.

## Eureka District.

**ORE SHIPMENTS.**—*Sentinel*, March 17: During the past week ore shipments were made from the mines of the district as follows: To the Eureka Con.—Belmont mine, 7 tons; Silver Lick, 16 tons; Margueretta, 1 ton, and Jackson, 19 tons. To the Richmond—Marguerite mine, 8 tons; Phoenix, 6 tons; Dunderberg, 3 tons; Seventy-Six, 6 tons. The above is the lightest business in side ores that our furnaces have recorded for several years, owing to the very heavy condition of the roads leading to the mines, but as soon as the teams can make regular trips we expect they will have all the ore hauling that they can attend to.

## Globe District.

**GOLO.**—Belmont *Courier*, March 10: The Downey Bros. are working their gold mine in this district. It is producing some very fine ore which is shipped for reduction.

## Gillis District.

**THE STAR MINE.**—*Walker Lake Bulletin*, March 17: The Star mine is more than fulfilling expectations. The shaft is now down 140 feet with good ore in the bottom. A drift has been run 50 feet from the 70-foot level, which shows a strong ledge of good ore all the way. The shaft will be sunk 20 feet deeper, when drifting will be begun. Enough ore

has been taken out in sinking to more than pay the expenses of development, and when the miners begin stopping the profits will be large, as the pay rock is in sight to work on.

#### Hawthorne District.

**THE POORMAN'S DISTRICT.**—Walker Lake Bulletin, March 17: Hawthorne district is more promising than ever before. It is the Poorman's district, emphatically. A number of the mines are now paying, and those that are showing fine prospects are increasing in number every day. Another development recently made in the Lapanta has added largely to its value and the lessees and owners have a certainty of a large dividend. The Pamlico continues its record as a profitable mine. The lessees of the Evening Star have a good strong ledge of rich ore in sight from which they have taken more than wages and expenses while sinking a winze. John Striker's mine, the Green Isle, is looking as well as ever. Tubino's Gold Bar is yielding good ore, and many other claims, such as the Puritan and North Star, will soon be worked. The miners find gold near the surface and are not obliged to spend a fortune before getting returns. A short time ago Webber gathered some earth from a gopher-hole on his claim, and on panning it out found that it was rich in coarse gold. This year will doubtless see more work done in Hawthorne district, and more money taken out than in the entire previous time of working in that section.

#### Ione District.

**HIGH-GRADE ORE.**—Esmeralda News, March 17: The mines around Ione, Nye county, never looked better than at present. The miners are taking out ore of high grade and plenty of it. There will be several tons of ore shipped to the Reno Reduction Works from the Ione mines within a few days.

#### Mammoth District.

**SHIPPING ORE.**—Belmont Courier, March 10: Alfred Welsh is busily engaged working his Lodi mine and shipping the ore to Reno for reduction. His last shipment was 15 tons of high-grade ore. Nothing to speak of is being done at Downeyville or Ellsworth.

#### Paradise District.

**COPPER AND SILVER.**—Belmont Courier, March 10: Hon. A. B. Millett and James Graham have a force of men at work in their copper and silver mines.

#### San Antonio District.

**LOOKING WELL.**—Belmont Courier, March 10: A. B. Eastwood has had some ore worked in Candalaria. The returns were satisfactory. The mines are looking well and producing a fine quality of ore. Mr. Eastwood is now on his way to Eureka with eight tons of ore which is being hauled by Jas. Fraser's team.

#### Taylor District.

**CO-OPERATIVE MINING.**—White Pine News, March 17: There is some talk of forming an organization in Taylor for the purpose of working some of the many promising prospects around here—and there are many to make a choice from. If our business men would all join in the enterprise the cost to each would be very small, with the chances of it repaying them a hundred-fold.

#### Tuscarora District.

**BELLE ISLE.**—Times-Review, March 17: No change in the workings in the old stopes.

**NORTH COMMONWEALTH.**—North drift prospect shaft has been extended 35 feet. The vein continues regular and well defined.

**FOUR TREASURE.**—Southeast drift, 150-foot level, has advanced 10 feet. Upraise No. 1 has been carried up eight feet.

**NAVAJO QUEEN.**—Good headway is being made in northwest crosscut, 200-foot level, which has been extended 16 feet during the week. The ground is looking very favorable, showing streaks and bunches of low grade in face of drift.

**GRAND PRIZE.**—South drift on the west vein, 300-foot level, extended 18 feet; total length, 223 feet—the vein being large but low grade.

**NEVADA QUEEN.**—On the east vein the drift has been turned north on the ore and advanced 20 feet. The grade of the ore has steadily improved going north, the face being all in good ore.

**NORTH BELLE ISLE.**—North drift, 400-foot level, has been advanced 14 feet. The vein looks favorable, shows considerable quartz and some ore. Fair progress has been made in opening up the front stope on the 300-foot level. The average output of ore continues the same in grade and quantity.

**COMMONWEALTH.**—South drift from station, 150-foot level, has been advanced 27 feet. Have cut through several seams of good ore from 3 to 12 inches thick. Face is looking very favorable to soon reach the main ore body. Ore taken out for the week averages over \$600 per ton.

#### ARIZONA.

**NOTES.**—Prescott Courier, March 16: Mr. Thompson tells us that Mr. Prout, who is examining mines in Copper Basin for an English company, is very well pleased with them. The basin is about 12 miles from Prescott. The road to United Verde will soon be dry, and coke, etc., will be taken to the smelters. John A. Jones is running his mill. It is 6 miles south of Prescott. Mr. Kastner and a party of miners left Prescott yesterday morning for the Congress mine. Dan O'Boyle is crushing gold rock in an arrastra, at the Montgomery mine, which is said to be 140 feet wide. A satisfactory cleanup of gold was made at the Lynx creek hydraulic mines, a couple of days ago. Paul S. Johns and Tom Reese are here from the Etta mine, which is opened to a depth of 200 feet. Ledge is large and rich in gold. Men are repairing the road to the mill. Mr. Raymond is here from his mine near Kirkland valley. Rock getting richer in free gold. He brought in several good specimens. Now that the weather is fine, and roads pretty good, miners will keep the sampling works busy.

**GLOBE DISTRICT.**—Silver Belt, March 17: Silver mining in Globe district, as is carried on up to date, either by individual or companies, has in nearly every instance been confined to surface work; real depth has never been attained as yet, and this fact, probably more than anything else, has caused, in many instances, unfavorable results. We recollect very well the time when the Old Globe mine, at a depth of 150 feet, was by many pronounced played

out, because good ore had ceased to be in sight, but notwithstanding the unfavorable outlook at that time, work was kept going with the view to attain depth, and the result was the opening up of a mine of wonderful richness. Thousands upon thousands of tons of the finest ore have been extracted since then, while now, at a depth of 500 feet, the formation has become more regular than ever, and the ore body in sight is simply wonderful.

**CENTRAL SILVER MINING CO.**—Florence Enterprise, March 17: One of the very promising mining properties of Pinal county is the group of claims 12 miles south of Casa Grande, recently sold by Mr. J. C. Loss to the Central Silver Mining Co., of St. Louis, Mo. The group consists of three claims, the Horn Silver, Silver Reef and Gray Eagle mines, upon which quite a large amount of development work had been done prior to the sale. Now three shafts are being sunk, one of them to be carried down 400 feet and the others 300 feet each. An ample force of miners are employed, and so soon as the hoist arrives additional men will be put on. Steam hoisting works and a 20-stamp mill have been ordered, and during the three or four months pending the construction of the mill at San Francisco the work of development will continue and the already immense ore body will be explored to a sufficient depth to determine the permanency of the mines. The company operating these properties organized under the name of the Central Silver Mining Co., with Messrs. Jno. Stephenson as president; Sig. Mayer, vice-president and secretary; Jno. Gaunt, treasurer, and W. W. Ashby, superintendent. The company will work the properties upon a legitimate business basis, and, as the immense body of ore already opened up will mill an average value of over 25 ounces of silver to the ton, they have a good prospect of large future dividends. This enterprise will add another producing property to Pinal county's long list of paying mines, and it will assist materially in the general prosperity of the southern portion of the county as well as of Casa Grande, its base of supplies.

**QUEEN OF SHEBA.**—Word comes up from the southern portion of the county that Superintendent Arthur H. Elliott has encountered ore in the Queen of Sheba mine, near the Vekol. In this discovery he has fully vindicated his good judgment, as his faith in the continuation of the Vekol vein through the Queen claim remained unshaken by the predictions of men who called themselves miners that no ore would ever be found therein. Mr. Elliott and his company are working in complete harmony, and while they have never taken occasion to claim more for their mine than could be backed by tangible evidence, they are likely to develop fully as valuable a mine as they hoped to find.

#### COLORADO.

**CRESTED BUTTE.**—Elk Mountain Pilot, March 17: Crested Butte wants a smelter and wants it bad. We produce all kinds of ore, and have coal, coke, lime, etc., right here, so that a practical man to start with a 20-ton furnace would be able to double the capacity inside of three months. We are in a position to guarantee a smelter 20 tons of ore per day. From Brush creek on the east, forming a complete semi-circle on the north to Irwin on the west, you can get any kind of ore needed.

**SYLVANITE.**—The progress on the Sylvanite crosscut tunnel this winter has been satisfactory to the management and Supt. Murphy. Work was commenced on January 5th, and about 225 feet has been driven through some of the hardest kind of rock. A Rand drill was used by compressed air, drilling and breaking sometimes six and eight feet a day. The full distance this tunnel must be driven to accomplish the purpose for which it is intended—cut the Sylvanite vein at a great depth—is a little less than 1500 feet, and from the distance run it will have to be run about 1250 feet. It is claimed that the work so far has cost about \$13 per foot. Work is progressing steadily at the Bullion King mine. The mineral in the lower level is improving very much of late. The anthracite coal mine started up again yesterday. When it shut down two weeks ago it was reported that it would not commence work again until about the first of May, but the orders come in so lively that the company were obliged to go to work. Only a small force will be put on at present, but no doubt it will be gradually increased until the full quota of men will be at work. As soon as the Burlington strike is declared off there will be plenty of demand for coal. The C. C. & I. coal mine here is still working on half and three-quarters time, with no immediate prospect of improvement very soon.

**LEAVILLE MINES.**—Leadville Dispatch, March 10: The Big Chief is daily expecting to cut the Castle View ore-chute. The drift is being driven south-east. The shaft is making very little water. The Gilt Edge, in California gulch, has struck some paying sulphide ore. The mine has had a large body of low-grade sulphide for some time, but until lately did not seem able to get any that would pay. The Moyer shaft of the Iron Silver Co. has a good body of pay. This mine and the Gilt Edge seemed to be sisters in misfortune, and luck also, as they have each found good ore in the same week, and have each worked for a long time in low-grade sulphide ore. The Castle View mine has cut the ore body in the east drift from the bottom of the shaft. The drift was run in on a level and caught the ore on its pitch to the east. The Castle View is producing some but has not entered the lists as a regular shipper. Mr. Mike Kennedy of the Hibernia and May Queen is superintendent, Mr. John Curtin having resigned that position. Manager Harrison of the Leadville Consolidation has just completed cutting the pump station at the 480-foot level in the Hege-man shaft and will begin drifting on the contact in a day or two. From indications it would seem that if there is a second contact in that vicinity the Hege-man shaft has it. Stopping in the old workings has begun and shipments may be expected therefrom. The Col. Sellers is under the efficient management of Charles L. Hill, showing immense bodies of sulphide ore. The big chute found in the A. Y. and Minnie crosses the Sellers territory and has been opened 125 feet of its length.

**EMPIRE.**—Georgetown Courier, March 15: Empire is having quite a little boom. A concentrator will soon be in running order and then it will be possible to make a large and economical saving in the treatment of pyritic gold ores. Mr. Vivian will return to England shortly to close up a deal by which many of the best known lodes pass into the

hands of an English company that proposes extensive development and the erection of powerful machinery. His return at this season was to settle up the Kohinor-Donaldson affairs, which company has also raised an unusually large working capital and will resume operations very soon. Mr. Vivian will represent that company also. He has succeeded in convincing investors that Clear creek has gold ores and plenty of them, and all that is needed is work and economical management.

**THE MENDOTA.**—A. Lundstrum, lessee, has taken the water out of the bottom of the old shaft on the Mendota and commenced work upon the lower level west. A millrun on Saturday of a mixture of galena, resin-blende and rock, of which there is from 8 to 14 inches, returned 113 ozs. silver to the ton. Ed Jones has, in the east level above, from two to three feet of galena, and two men are taking out about ten tons a week and making \$20 a day.

#### DAKOTA.

**OUTLOOK FOR DEERWOOD.**—Pioneer, March 16: A few days since the Pioneer called attention to the fact that lead ore had been found in the Oxford mine, Bald Mountain district. The ore was described as appearing in a vein from 6 to 18 inches wide, and as resembling closely the carbonate ores of Leadville, Colorado. The percentage of lead is stated at from 15 to 40, while the value of silver shown by assays has reached as much as \$353 to the ton of ore. As before remarked, chief importance attaching to the find is because, until its announcement, the presence of any other than arsenical refractory ores in the district had not been apparent. Inquiry and research among owners of other claims in the same district, who at present are pushing developments upon their properties, brings to our knowledge that in at least two other instances similar discoveries have recently been made. One of these is in the Ajax lode, the property of Messrs. Koenigsberger and Delano. The other is a claim belonging to John Greenough. In both cases the percentage of lead contained in the ore is exceedingly large. An established fact concerning the Bald Mountain mines is that the ore bodies are of more than usually large proportions. The formation is a flat one; the ore occurring in blanket veins spread over a large area. The deposit frequently presents an unbroken width of 50 or 60 feet, and is usually from 10 to 18 feet thick. In one or two notable instances, the Buxton for instance, the dimensions are even greater than described. These facts appearing beyond controversy, a natural deduction is that development of the bodies of lead ore recently discovered will demonstrate them to have equally large proportions; in which event the ultimate output from this district can hardly be estimated. It is beyond conjecture, for the obvious reason that the exploration of other properties may at any time result in similar disclosures. It never rains but it pours. For years, while struggling with the problem of cheap reduction for the ores of the district, the best informed miners had no knowledge that any appreciable quantity of lead existed in a single one of the mines. Had the discovery been made three or four years since, a large smelting plant would undoubtedly now be in operation. The date when such a plant will be erected is at present contingent on the rapidity with which developments of these lead ores are made.

#### IDAHO.

**TIPTOP.**—Inter-Idaho, March 16: The deed of the Tiptop mine of Rocky Bar has been put on record. The price was \$50,000 and the purchaser was Frank Hodgkinson, residing at Petersburg, England, but a citizen of the United States. He is probably acting for an English company. The seller is Edward C. Thompson of Meadville, Pa.

**THE BONANZA COUNTRY.**—Ketchum Keystone, March 10: The present indications are that this rich mining district will be the scene of unusual activity during the coming season. The extensive operations which will be set in motion by the Dickens-Custer Co., Limited, as soon as the snow shall have disappeared; the additional exertions that will be made by Morrison & Pearsons in the working of their rich mining claims on Jordan creek—which proved so remunerative in the first operation of their mill last season—together with other mining enterprises that will be likely to start up, all betoken a vigorous campaign and a successful season's operations. These operations will of course increase the amount of freighting supplies and machinery to be done from Ketchum, it being the natural outlet and nearest point to the railroad. The Ketchum and Sheep mountain road will run to a point within 16 or 18 miles of Bonanza, thus adding another feasible route to and from the district besides the Ketchum and Challis road.

#### MONTANA.

**GRANITE.**—Phillipsburg Mail, March 12: The output of the Granite for the week ending March 3d was 60,277.81 ozs. fine silver and 36.84 ozs. gold. The output of mill and mine continues steady and undiminished.

**SAN FRANCISCO CON.**—The sinking of the shaft continues and the sump is rapidly nearing the 400-foot level, at which point it is the intention of the company to drive exploratory levels east and west along the vein to explore the property in the most thorough manner. The pitch of the vein as determined by its hanging-wall is now more uniform, and the indications which in this formation sometimes point the approach to a rich ore body are numerous and promising. Trouble is being experienced with bad air in the tunnel, and we are unable to say whether at this moment work in that level is being prosecuted or not. The blower was placed in position last week.

**WEST GRANITE.**—The Butte crosscut is in 480 feet from the point of taking cover. The ground at the header is hard granite, though the flow of water is considerable and the progress made is very fair. At the 400-foot level of the Rattlesnake the east drift is in a distance of 395 feet in a wide loose vein, carrying streaks of low-grade ore running in stringers and constantly varying in size and quality. The flow of water continues unabated, but causes no further trouble, owing to the extra pumps now in use.

**SMELTHER IMPROVEMENTS.**—Anaconda Review, March 15: The improvements at the Smelter are being prosecuted with increased energy. The past

week the work of putting in new Ball stamps, to supply the places of the Cornish rolls at the old concentrator, is well under way. The company have the frames up of a number of cottages at the lower works for the use of their employees, and will soon have a number of cottages at the upper works. An addition at the upper works to smelter No. 2 is entirely completed and two more matting furnaces are thereby added to the smelting plant, giving the company 28 matting furnaces at the upper works. The amount of lumber and material now being received and the additional force which has been put on indicate that the company will far eclipse all previous efforts this season.

#### NEW MEXICO.

**HERMOSA.**—Black Range, March 16: The Dora, the next claim west from the Argonaut-Consolidated, has been leased to Socorro parties. George Beebe has taken a lease on the Antelope, and is getting out good ore from the north workings. The adit on the Favorite, on Yuma mountain, shows a quartz and lime vein full of mineral dipping into the mountain with an easy slope. The Atlantic Cable strike still continues to show well along the east side of the west drift, and test workings driven into this ore face show it to be continuous. A new adit has been started on the Contact mine, just below the falls of the Rio Palomas, and on the north side of the river. The old adit on the south side is about 40 feet into the hill. Kirk & Terry, the lessees on the Argonaut-Consolidated, have made a fine strike of high-grade ore in the winze in the west drift from the main adit, the ore is dipping down into the lime and a winze has been started to follow it. Assays from this ore give returns of 512 and 286 ounces silver to the ton. The progress made by Messrs. Jarrett & McRae in taking out high-grade ore from the Palomas Chief is most flattering. The ore coming out will run fully as high as that before the shut-down last September, which gave 323 and 429 ounces in silver to the ton in carload lots. The mine is worked night and day.

#### OREGON.

**WATER SCARCITY.**—Jacksonville Times, March 16: Miners have had a fair run, but in many places water is light. Mr. Kieslin has put up a mill at the quartz ledge in Murphy district, which he has bonded. The prospecting of the Mountain King mine on Powell's creek, Josephine county, has been resumed. Sherer & Jolson of Grant's Pass, who are interested in the Whiskey creek mines, have some fine specimens of gold, taken from them, at their store. They have their property thoroughly opened now and expect to do well in a short time. Green Bros. are still prospecting their quartz mine in Galice creek district with excellent prospects. They have had some of their tailings assayed and received favorable returns and an offer to purchase them recently.

#### UTAH.

**MINES OF STAR AND MILFORD.**—Cor. Salt Lake Tribune, March 16: The mines throughout Star and the surrounding districts still keep up their lick, and considerable ore will be shipped this spring and summer if lead keeps up, and with the hope that silver will advance, many claims that now lie idle will be worked. South and west of us are many discovered claims now lying idle waiting for a railroad, and many are yet to be discovered. With a little money judiciously used in prospecting and exploring old and abandoned claims, good results, I am sure, would follow, for claims that would not pay a few years ago would pay now, under good management, such as copper and low silver-lead mines. Those that remain here are now too poor to do much deadwork or work on claims that there are no immediate results from. Still every day new developments are taking place in those that are being worked to justify a more extensive working of claims in Star district. Considering the small number of men now working in Star district, and the amount of ore shipped in the past six months, it speaks well for the district and the miners who stay with it. Star district has been a camp since 1871, and looks as well, if not better, to-day than it ever did. All the claims that Mr. Campbell leased have paid a fair remuneration to the lessee. West of us, in San Francisco district, are many claims that should be worked, for they look well, but need capital to open them up. Marble, copper, sulphur and copper deposits are now lying idle, awaiting capital to take hold. Considerable ore is now coming in from Piche, Bullion and Bristol, and are received by the Utah Consolidated Forwarding Company.

**PARK NOTES.**—Park Record, March 17: The Anchor drain tunnel is now in nearly 3000 feet and 100 feet per week is the average distance driven. It is understood that R. C. Chambers will succeed John J. Daly as superintendent of the Daly mine and mill. As soon as the Ontario No. 2 shaft is put in better shape, drifting on the vein will be commenced from a new point, the 1200 level. Wm. McKay was up from Salt Lake the first of the week on business connected with the Massachusetts company. It was learned that his company was sufficiently satisfied at the indications as to contemplate the sinking of the shaft 200 feet further.

**ORE AND BULLION SHIPMENTS.**—During the week the Crescent shipped 120,000 pounds of first-class ore. For the week just ended the Mackintosh sampler received 182,160 pounds of Ontario ore; 269,470 of Daly and 45,570 of Sampson ore; total, 397,190 pounds. Last Monday eight bars of Daly bullion, 9255 fine ounces of silver, were shipped from the Marsac mill, and on Thursday another eight bars, 9002 fine silver ounces were shipped. The first of the week the Ontario shipped 34 bars of bullion, containing 20,987.28 fine ounces of silver.

#### WASHINGTON.

**THE DRILL IN MOTION.**—Ellensburg Capital, March 15: On Monday the drilling for gas or oil was begun at Cle-elum. Everything is in ship-shape, and the drill will go steadily down until it taps one or the other of those valuable adjuncts to human convenience and the industries of the world. Two thousand feet or more will be bored, if necessary, though the general opinion of old oil and gas men is that one-half of that distance will prove successful.

# H. P. GREGORY & CO.

Cor. Fremont and Mission Sts., San Francisco, Cal.

IMPORTERS AND DEALERS IN ALL CLASSES OF

## MACHINERY

## ENGINES and BOILERS

FROM 2 TO 100 H. P., ALWAYS IN STOCK

MILL SUPPLIES AND LUBRICATING OILS.

## THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

## AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

## Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

TATUM & BOWEN,

34 and 36 FREMONT STREET,

SAN FRANCISCO, CAL.

Manufacturers of Mining and Sawmill Machinery, Engines, Boilers, Etc.

**H. H. H. HORSE LINIMENT.**  
THE H. H. H. Horse Liniment puts new life into the Antiquated Horse! For the last 14 years the H. H. H. Horse Liniment has been the leading remedy among Farmers and Stockmen for the cure of Sprains, Bruises, Stiff Joints, Spavins, Windgalls, Sore Shoulders, etc. and for Family Use is without an equal for Rheumatism, Neuralgia, Aches, Pains, Bruises, Cuts and Sprains of all characters. The H. H. H. Liniment has many imitations, and we caution the Public to see that the Trade Mark "H. H. H." is on every Bottle before purchasing. For sale everywhere for 50 cents and \$1.00 per Bottle.

For Sale by all Druggists

## THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works.

Sole Manufacturers,

827 First Street, San Francisco, Cal.

## WINCHESTER HOUSE,

44 Third Street, San Francisco, Cal.

This Fire-proof Brick Building is centrally located, in the healthiest part of the city, only a half block from the Grand and Palace Hotels, and close to all Steamboat and Railroad Offices.

Laundry Free for the use of Families  
HOT and COLD BATHS FREE.

Terms, Board and Room, \$1.00 per Day

And upward.

ROOMS WITH OR WITHOUT BOARD.

FREE COACH TO THE HOUSE.  
J. POOLEY.

## JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.  
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.  
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.  
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing. Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO.,  
Springfield, Ohio, or 110 Liberty St., New York.  
FRASER & CHALMERS, General Agents,  
Chicago, Ill., and Denver, Col.  
PARKE & LACY, General Agents, San Francisco, Cal.

GREAT REDUCTION!

## BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates. I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

## PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass, Zinc and other metals punched for all uses. Inventor and Manufacturer of the celebrated Slot-Cut or burred and Slot Punched Screens. Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,  
21 & 223 First St., San Francisco, Cal.  
JOHN W. QUICK, Proprietor.

## CLAYTON IMPROVED MINING PUMPS

**AIR COMPRESSORS**  
For CATALOGUES, ESTIMATES, Etc., Address,  
Clayton Air Compressor Works  
OF BROOKLYN, N. Y.  
43 DEY ST., NEW YORK.

**LIGHTNING WELL MACHINE MAKERS.**  
We are the largest Manufacturers—have sunk 529 ft. in 10 hours. Our Encyclopedia of 800 engravings of Well, Wind-Mill, Prospecting, Pumping and Diamond Pointed Rock Drilling Machinery, or our treatise on Natural Gas will be mailed for 25 cts. Are aiding parties who advertise to make Hydraulic machinery, and their customers for using.

THE AMERICAN WELL WORKS,  
AURORA, ILL., U. S. A.

## THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as The Safest and Strongest High Explosives in the Market.

## GIANT POWDER or DYNAMITE, Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE, which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

## JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

## BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO CAL.

SOLE AGENT FOR  
Adamantine Shoes, Dies and CRUSHER PLATES,  
—AND—  
Chrome Cast Steel for Rock Drills, Etc.

H. D. MORRIS,  
220 Fremont St., San Francisco,  
MANUFACTURERS' and PURCHASING AGENT.  
Special attention given to purchase of  
**MINE and MILL SUPPLIES.**

ADAMANTINE SHOES AND DIES.—Quaranteed to prove better and cheaper than any others. Orders solicited, subject to above conditions.  
H. D. MORRIS.

## THOMAS PRICE'S ASSAY OFFICE, CHEMICAL LABORATORY, BULLION ROOMS and ORE FLOORS, 524 Sacramento Street, San Francisco, Cal.

COIN RETURNS ON ALL BULLION DEPOSITS IN 24 HOURS.  
WORKING TESTS OF ORES BY ALL PROCESSES.  
SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.  
Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

## Metallurgy and Ores.

**SELBY SMELTING and LEAD CO.**  
416 Montgomery St., San Francisco.

**GOLD AND SILVER REFINERY And Assay Office.**

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

... MANUFACTURERS OF ...  
**BLUESTONE, LEAD PIPE, SHEET LEAD, SHOT, Etc., Etc.**

ALSO MANUFACTURERS OF  
**Standard Shot-Gun Cartridges,**  
Under Chamberlin Patent.

## JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

**ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,**

CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, ETC.

63 & 65 First St., cor. Mission, San Francisco.  
We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc. to our full stock of Balances, Furnaces, Muffles, Crucibles, Smelters, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England. Also for E. O. DENNISTON'S Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of silver guaranteed. Orders taken at his lowest prices.

JOHN TAYLOR & CO.

## Nevada Metallurgical Works.

**THE RUSSELL PROCESS COMP'Y.**  
C. A. STETEFELDT, President.  
NEW YORK OFFICE, 18 BROADWAY  
Room 709.

News in Brief.

They are using crude petroleum as fuel for burning bricks at Pasadena.

One day last week there were landed at New York 2262 immigrants, most of whom are bound West.

A MEMORIAL to Congress has been prepared, urging the necessity of a quarantine station at this port.

The wire cable for the new Powell-street line in this city is 26,680 feet long and weighs 48,500 pounds.

RIVERSIDE is likely to have a motor road to Colton, before long, connecting with the line to San Bernardino.

SEVERE earthquakes have been experienced in Yunnan, China, and at one place some 4000 people were killed.

The House Committee on Territories has decided to report the bill for the organization of the Territory of Alaska.

The U. S. Supreme Court has rendered a decision in the telephone case, giving a verdict in favor of the Bell patent.

ARRANGEMENTS have been made looking to the establishment of a line of freight ships between Australia and Portland direct.

The Ontario Land & Colony Co. celebrated the fifth anniversary of the inaugural improvements of their colony on the 17th inst.

CONGRESS will probably authorize the placing of certain beacon lights at prominent points on the Sacramento and San Joaquin rivers.

SECRETARY BAYARD has recommended the President to appoint Jas. V. Coleman as Chief Commissioner to the Melbourne Exposition.

The new Hotel del Monte is finished and has over 400 guests, including distinguished people from the Eastern States, Canada and Europe.

AT Ubita, San Bernardino county, last week, an artesian well at the depth of 175 feet struck water which sends a stream 40 feet in the air.

GORDON HUGHES, an Ohio boy, son of the American Consul at Birmingham, has won, in competition with 52 others, a Cambridge scholarship worth \$2000.

The Railroad Commissioners are inquiring into the condition of affairs by which the California Southern is charging slightly higher rates of fare than other lines in that part of the State.

The Board of Trustees announce that the Twenty-third Industrial Exposition of the Mechanics' Institute will open Tuesday, Aug. 7, and will close on Saturday evening, Sept. 15, 1888.

EXPORTS of wine from this port, from January 1st to March 1st, were 938,800 gallons, of an approximate value of \$414,000, against \$31,200 gallons valued at \$366,000 in the same time last year.

The Supervising Architect of Public Buildings at Washington has recommended to the Secretary of the Treasury that \$40,000 be appropriated for the repair of public buildings in San Francisco.

NEVADA local hunters say that the cold wave which swept across Western Nevada last January killed all the rabbits and thinned the ranks of the badgers and coyotes formerly so numerous on the desert.

The War Department has issued an order for the abandonment of the military reservation at Carlin, Nev. It will be turned over to the Interior Department and steps will be taken for its sale as public land.

SENATOR DOLPH has introduced a bill to authorize the construction of a railway bridge over Clear Water river in Idaho, and for the Navigation Company to build a bridge over Snake river, at Texas Ferry, W. T.

NOT all the immigrants from Europe come to us. There are 21 companies running regular lines of steamships between Buenos Ayres and various European ports. Immigrants are thronging to New Zealand and Australia.

PARTIES visiting the volcano of Popocatepetl recently, report an increasing activity in the crater, with clouds of smoke and sulphurous fumes. Reports from Central America show that several volcanoes are unmistakably in renewed activity.

HORSE-STEALING by a thoroughly organized gang has been going on in Los Angeles county for several months past, and it is estimated that \$100,000 worth of animals have been run away with. The officers of the law have so far been baffled by the thieves, and the sheriff has called police detectives to his assistance.

CONTRACTS were signed by parties in Fresno, and a man has gone to North Carolina to ship to that country 300 negro families. Most of these will replace Chinese in the orchards and vineyards. It is said that the women and children in vineyards do better than Chinamen, while the men in the sweat and drying houses learn the business of curing raisins much better and faster than the Chinese.

DAIRMEN of Missouri have sent the U. S. Senate a strong petition in favor of removing the duty on foreign salt. The petitioners claim that the tariff does not have the effect of improving the quality of home salt, while the tax falls directly on dairymen who need the best quality of English salt in the manufacture of butter and cheese. It is pointed out that a salt trust prepared by American manufacturers is designed to increase the burden.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING MARCH 13, 1888.

- 379,441.—SNOW PLOW—L. J. Bergendahl, Pendleton, Ogn.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

NON-POLARIZING CONSTANT-CURRENT BATTERY.—Frank J. Crouch, Eugene City, Oregon, No. 379,372. Dated March 13, 1888. This improved voltaic battery consists of a jar containing a leaden coil-wheel which is connected with one binding-screw, a zinc plate which is connected with the opposite binding screw, the two being separated and surrounded by sand, which is tamped in, and both of them lie above a hedy of sulphate of copper, which is placed on the bottom of the jar, while above the whole a mixture of sand and salt is tamped, and the whole is covered with a concave perforated cap of plaster of Paris, tenacious clay, or other closing material. The object of the sand is to keep the metal clean and cause a greater steadiness in the chemical action and prevent all bubbles or deposits from accumulating, so as to weaken the action, which is common in ordinary batteries. The absence of any liquid and the solidity with which the parts are secured together make it a valuable battery to ship or move about. To set this battery up for use the operator simply pours the concave basin on the top full of water and allows it to stand four or five hours, with the poles or binding-screws connected, and the water will gradually percolate through the packing to the bottom. If the battery prove not strong enough, more water may be poured in after the first has been absorbed until no more can be absorbed by the battery. This battery will then work for several weeks without any care and if it becomes weak after a time it may be enlivened by placing a tablespoonful of solution of sulphate of zinc or copper in the basin, so that it will flow down into the interior. The battery may be used in the same manner with other batteries, being coupled up either for quantity or intensity. The inventor of the battery is quite a young man, who has distinguished himself by producing several other original inventions.

RAILWAY TIE.—Joseph Jacobs, S. F. No. 379,399. Dated March 13, 1888. This railway tie or sleeper has a metallic case or frame filled with concrete, asphaltum concrete or cement, or any similar substance originally plastered, but which hardens and forms the body of the tie, and is protected by the metallic case. The invention also consists in a metallic case or frame made of a single piece of sheet metal and fashioned into an elongated box-shape having a bottom, sides and ends, this case or frame being filled with a suitable strengthening material forming the body of the tie. The object of the invention is to provide a cheap and durable tie for railroad purposes.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Oons. California and Virginia, March 17, \$99,876; North Belle Isle, 18, \$20,000; Alice, 14, \$22,640; Pollock, 14, \$10,688; Lexington, 14, \$28,792; Moulton, 14, \$24,800; Hanauer, 15, \$23,500; Crescent, 15, \$32,500; Germania, 15, \$9777; Hanauer, 16, \$2200; Germania, 16, \$2530; Queen of the Hills, 17, \$1077; Hanauer, 17, \$1775; Germania, 17, \$4767; Queen of the Hills, 17, \$1075.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not know fully until the paper to anyone who does not wish it, but if it is continued through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send one but worthy man.

JOHN O. H. LAMPADIER—S. L. Obispo & S. Barbara Co.'s. O. W. INGALLS—Arizona Territory. W. M. WILKINGS—Fresno Co. A. F. JEWELL—Yuba and Sutter Co.'s. C. E. WILLIAMS—Yuba and Sutter Co.'s. R. C. HUSTON—Montana Territory. E. H. SCHARFF—Calaveras and Sacramento Co.'s.

MESSRS. ROSS are about to build at their shipyard on Ithmus slough, on Coos bay, a steam schooner for a Santa Cruz company. The new vessel will be furnished with a Corliss engine, use petroleum for fuel, and her mainmast will be of iron and serve also as a smokestack. She will have a carrying capacity of 300,000 feet of lumber.

W. H. OHMEN, who has been for some years established at No. 12 Fremont street, has moved to No. 107 on the same street. The vertical and horizontal engines made by Mr. Ohmen have made splendid records, and all those in use in this city are pronounced great economizers of fuel.

THE PACIFIC BUSINESS COLLEGE in this city is the best known institution of its kind in the West. A diploma from this college is the best possible recommendation for a person in search of a position in any of the great business houses, as it is recognized everywhere.

ENOCH P. ROWE, superintendent of the Josephine mine at Volcanoville, which is owned by Joseph Nougues of this city, has disappeared. About \$6000 in bullion and amalgam is also missing.

## Mining Machinery For Sale.

Having completed our tunnel, we offer for sale:

- 1 No. 4 Burleigh Air Compressor, with shaft arranged to be run by steam or water power.
- 1 No. 4 Duplex Clayton Air Compressor.
- 1 Air Tank, 48 in. by 16 ft.
- 1 Llewellyn Water Heater, 24 in. by 8 ft.
- 1 No. 3 Knowles Pump.
- 1 Small Hooker Pump.
- 7 Burleigh tunnel drills.
- 1 Lot of Drill Extras.
- 1 "E" Battery for blasting.
- 1 Triple-Geared Hoisting Engine, built by Copeland & Bacon.

The machinery is all in good order and can be seen at our works. For prices and other information, address

**BIG BEND TUNNEL & MFG CO.,**  
Big Bend, Butte Co., Cal.

### FOR SALE.

**A Complete Ten-Stamp Mill (NEW),**  
Suitable to work free-milling or sulphuretted ores. Will be delivered on board cars at Merced, if desired. Address

**F. T. HOUGHTON,**  
Hornitos, Cal.

**Practical Treatise on Hydraulic Mining.**  
By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdy, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dwyer & Co., Publishers, 252 Market St., San Francisco.

**HORACE D. RANLETT,**  
Ores, Mining, and Commission,  
420 Montgomery St., S. F.

BUSINESS MANAGER OF  
**UNION COPPER MINE, Calaveras Co.,**  
**NEWTON COPPER MINE, Amador Co.**  
Correspondent as Agent for Smelters in London, Liverpool, New York, Boston and Baltimore.  
Twenty years experience, in California, purchasing Ores and dealing in Mines.  
Special attention given to management and sales of mines and purchase and shipment of copper produce.

### QUARTZ MINES FOR SALE.

Under good bonds, several first-class Gold Quartz Mines, located in Amador county on the true lead; well developed and ready for mills. Samples and all particulars at office of the above.

GO TO THE OLDEST AND THE BEST

**PACIFIC**  
**Business College,**  
**320 POST ST.**  
**SAN FRANCISCO.**

**LIFE SCHOLARSHIPS, \$75.**  
No Vacations. DAY AND EVENING SESSIONS.  
Ladies admitted into all Departments.  
Address: T. A. ROBINSON, M. A., President.

### FOR SALE.

**2 Triumph Concentrators.**  
**1 New 12-inch, 35 H. P. Engine.**  
VERY CHEAP. Apply  
130 Sansome St., room 12.

## FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

**IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,**

And renewals will not cost over one-half as much as for stamps. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

### FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager. - - - 461 Howard St., San Francisco.  
HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

## CALIFORNIA VIGORIT POWDER CO.,

No. 40 California Street, San Francisco,

—MANUFACTURERS OF—

## NITRO-GLYCERINE

("DYNAMITE" or "GIANT")

## Blasting Powders.

Vigorit "LOW" Powder,

FOR REMOVING STUMPS AND TREES,  
HAS NO EQUAL.

WORKS: California City, Marin Co., Cal.

ED. G. LUKENS, Manager.

## ELECTRIC DEVELOPMENT COMPANY.

## Incandescent & Arc Electric Lights.

Electric Motors, Dynamos, Trams, Elevators, Signals and all kinds of Electrical Systems for lighting and transmission of power, either direct or with storage Batteries.

For Mines, Hoisting Works, Mills, Reduction Works,

Indoor and Outdoor Illumination of every kind. Gas, Oil and Candles superseded by the

### EDISON INCANDESCENT LIGHT,

The only complete and satisfactory incandescent system. Lights require no attention and are under complete control. Over 500,000 lights in use in the United States. SELF-REGULATING ARC LIGHTS turn night into day and afford a means of working the whole 24 hours; invaluable to contractors and others to whom time is an object. Estimates and designs on application.

Offices and Showrooms, 323 PINE ST., SAN FRANCISCO.

## DEWEY & CO.'S

Scientific Press

Patent Agency.

ESTABLISHED 1868.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us offer to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St. S. F.

"RED FLAX" CORD

### SQUARE FLAX PACKING,

Manufactured from strictly first-class Flax and pure lubricants. Superior to all others for Water and Steam. Pac's with less friction and makes a tighter joint than any other packing made. Imitations of inferior quality having been put upon the market, we have been compelled to adopt the above trade-mark, and all of our packing will now have a RED CORD running through the center its entire length. See that you get it and take no other. Sold by all Hardware dealers. Price, 50 cents per pound. W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market St., San Francisco, Cal.

## HOISTING ENGINES FOR MINES.

1, 2, or 4 Drums, with Reversible Link Motion or Pat. Improved Friction.

MADE ONLY BY THE

**LIDGERWOOD M'FG COMPANY,**  
96 Liberty St., New York.

PACIFIC COAST AGENTS,  
**PABKE, LACY & CO.**  
SAN FRANCISCO.

ARE YOU GOING TO PUT UP MACHINERY OF ANY KIND?  
Are you going to make any change in machinery? Do you want Pulleys on Shafting already up? If so, don't fail to look into the merits of

THE DODGE PATENT INDEPENDENCE

## WOOD SEPARABLE OR SPLIT PULLEYS.

They are the Lightest, Strongest, Best Balanced and

Most Convenient Pulleys Made in the World.  
Entirely new and original. Adapted to any power required. Time, trouble and money saved by using these pulleys.  
Price List and Catalogue mailed free.

## PACIFIC ROLLING MILL CO., .....MANUFACTURERS OF..... Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought  
Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MA-  
CHINERY CASTINGS of Every Description.

— ALSO —

**HOMOGENEOUS STEEL, SOFT and DUCTILE,  
SUPERIOR TO IRON FOR  
LOCOMOTIVE AND MARINE FORGINGS.**

ALSO Steel Rods, from 1/4 to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape  
Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths  
STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled  
Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat  
Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames,  
and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

Orders will have prompt attention. Send for Catalogues. Address

PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

## FULTON IRON WORKS,

HINCKLEY, SPIERS & HAYES, Proprietors.

(ESTABLISHED IN 1855.)

Office, 213 Fremont St.,

San Francisco.

—MANUFACTURERS OF—

**MARINE ENGINES AND BOILERS.**—  
Propeller Engines, either High Pressure or Compound  
Stern or Side-wheel Engines.

**MINING MACHINERY.**—Hoisting Engines and

## ATTENTION, GOLD MINERS!

WE ARE SELLING

### Silver-Plated Amalgamating Plates

For Saving Gold in QUARTZ, GRAVEL and PLACER MINING,

At reduced rates. Get our prices. Three thousand orders filled. Fifteen medals awarded. Our plates have proved the best, and far superior to others in weight of silver and durability. Old mining plates replated. These plates can also be purchased of JOHN TAYLOR & CO., cor. First and Mission Sts.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS,

E. G. DENNISTON, Proprietor.

653 & 655 Mission St., San Francisco, Cal.

NOTICE.—Mining men are cautioned against fraud in purchasing poor mining plates made in this city; they have proved defective in the silver-plating, and in having much less silver than was contracted for. When in doubt make an assay; thin, light Silver-plating looks the same as heavy. **SEND FOR CIRCULAR.**

## NOTICE TO GOLD MINERS!

### SILVER-PLATED AMALGAMATED PLATES

#### For SAVING GOLD!

IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER

FULL WEIGHT OF SILVER AND BEST QUALITY OF WORK GUARANTEED.

GET OUR PRICES BEFORE ORDERING ELSEWHERE. SAMPLES FURNISHED ON APPLICATION.

SAN FRANCISCO NOVELTY AND PLATING WORKS,  
No. 108 FIRST STREET.

NOTICE.—All our plates are guaranteed to have the full weight of silver agreed upon, and are tested before leaving our works, thereby avoiding the complaints about light weight, made so often before we started in this branch of industry.

## IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the **IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS**, with lever attachment, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under a decision of Sawyer, Judge of the U. S. Circuit Court, in the case of Hendy and Fisher vs. R. Hoskin et als.

We also manufacture the **Single-Jointed Giants**.

Prices and Catalogues of Hydraulic Mining Machinery furnished upon application.

JOSHUA HENDY MACHINE WORKS,

39 to 61 Fremont St., San Francisco, Cal.

This cut represents our

### IMPROVED HYDRAULIC MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style *two* jointed machines, which are superseded by our new style *one* jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

Send for Circulars and Price List

HOSKIN & CO., Marysville, Cal.

PATENT

## LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning  
and Salivation.

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, Threshing and Stock-driving, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

Address communications and orders to

JOHN TAYLOR & CO., Sole Agents

63 & 65 First St., cor. Mission, San Francisco.

Send for Descriptive Circulars containing Testimonials of well known parties who are at present using them.

### THE SCIENTIFIC KIT OF TOOLS

Warranted the Best and Cheapest on the market. Can furnish Kit complete or any part of it, leaving out articles parties may have or do not want. Can furnish larger Forges with lever if desired. Also the **SCIENTIFIC GRINDING MILL "The BEST MILL ON EARTH."**

SAN FRANCISCO, CAL.

# \$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE  
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

## The T. H. Risdon Turbine Water-Wheel.

At the Centennial Exhibition in 1876 there was a test of turbine wheels, one of the most extensive ever made, and one of unusual interest because of the results, which were not at all in accordance with previously formed opinions respecting various wheels.

This was especially true of the one we are going to describe, which came almost "unheralded," and carried off the first prize against all competitors.

The Risdon water-wheel is made in New Jersey, near Philadelphia, and had earned for itself a good reputation in a limited circle, but no one expected that it would do more than secure a creditable place in the test above mentioned.

As to the efficiency at Philadelphia, 19 different wheels were tested, this Risdon giving an efficiency as follows:

	Per cent.
Full gate.....	87.68
3/4 gate.....	86.33
1/2 gate.....	82.52
1/4 gate.....	75.35

No result of the kind had ever been attained, the wheels coming next, the "National," being four per cent below, and the Geylein third, with nearly the same result as the "National."

The Laffel and other wheels best known on the Pacific Coast were not entered for tests.

At Holyoke, Mass., where there is the most complete plant known for testing turbine wheels, the Risdon maintained its record. Among 36 different wheels it stands at the head with the following efficiency:

	Per cent.
Full gate.....	91.30
3/4 gate.....	88.30
1/2 gate.....	75.60
1/4 gate.....	72.77

Of these tests, Mr. James Emerson says, speaking of the Risdon wheel: "The wheel is well made, and, I believe, gave the highest result ever yet obtained by a turbine wheel."

With this much respecting the remarkable results of this turbine, we will now give some description of its construction.

Fig. 1 is an elevation of the Risdon wheel and Fig. 2 shows an elevation of the same wheel with a "register" gate such as is commonly employed for turbines. This gate contracts the issues in the direction of their narrow width, while the cylinder gate in Figs. 3 and 4 contracts the issues in their depth instead of width, so the column assumes a square section, or approximates one, instead of a thin, vertical sheet.

Fig. 3 is a vertical section through what is called the cylinder-gate type, the one giving the highest results, and the kind mostly made at the present time. [See cont, page 201.]

The "refinement," as we may call it, and some explanation of the wheel's performance, will be seen in Fig. 4, showing the form of the vanes and the departure from ordinary practice,

the two most noticeable features being the water impinging against convex instead of concave surfaces and the provision to meet centrifugal force by the curves as seen at the issues.

This is in effect the opposite of ordinary turbine practice, yet more nearly conforms to the hydrodynamic law of surfaces at a right angle to the line of force. This form of the vanes, changing from a convex to a concave face from inlet to issue, is difficult to generate or describe, and is also difficult to represent in a drawing, and shows an example of iron casting that is remarkable. The surfaces are made perfectly

Fig. 1.—ELEVATION OF A T. H. RISDON TURBINE WHEEL.

smooth, and it is an achievement to be proud of in any foundry.

By the convex faces before mentioned it will be seen that the vanes offer to the entering water a surface normal to its course as the wheel revolves.

Fig. 5 shows an example of wheel mounting, two 20-inch wheels being inclosed in one case. We have numerous examples of mounting throughout the country, especially in New England, where most of the Risdon wheels have been erected, but cannot spare space to insert more.

Mr. J. Richards represents the Risdon wheel on this coast, and will furnish further information when wanted.

CHLORINATION WORKS are to be put up at the Buchanan mine, Tuolumne county. They will be large enough to take onstom work.

The Cœur d'Alens district is now yielding about 200 tons of lead per day.

## Natural Gas.

The discovery and utilization of natural gas in some of the Eastern States has worked a sort of industrial revolution. Its use for fuel and lighting purposes has had quite an effect on coal mining. According to estimates made by experts, the amount of coal displaced in Pittsburgh and Alleghany City alone, by the use of natural gas, is over 4,500,000 tons. The supply so far seems to be inexhaustible, and arrangements are being made to run pipe lines to some of the large cities, as in the case of Chi-

Fig. 2.—ELEVATION OF A RISDON WHEEL WITH REGISTER GATE.

cago. People have given up boring for petroleum and are searching for natural gas.

In the list of petroleum-producing States, California now stands third, and its resources in this respect are being very rapidly developed. Of late, owing to the finding of natural gas in the Eastern oil districts, efforts are being made here in the same direction. Indications of gas have been found in wells in Contra Costa, San Mateo, Lake, Marin, Sutter, Santa Clara and Sonoma counties, and also in some of the Southern counties. As yet no abundant and free flow of gas has been found, though at several places jets are burning. The conditions are not so well known here as in the East, but it is very probable that at one or more of the wells now being bored a good strong flow of gas will be secured.

It is stated that measures are being taken to prevent the Malakoff mine from working by the elevator process.

## A Vanishing Race.

As the years go by and the field of their labors contracts, that class of men known on the Pacific Coast as prospectors grows less and less. Of the original stock a large proportion, worn out with hardships and toil, have already gone to join the silent majority, their ranks having meantime been but little recruited because the unexplored mineral regions have undergone such steady contraction. We speak now of the professional prospector and not of the pioneer miners as a whole. Of the latter

there are still a great many left, but of that restless, hardy race, who, crossing the mining frontier, were the first to push out into the little-known, unpeopled regions beyond in search of mineral wealth, the number remaining is now comparatively small, and it will not be long until this class of men will be as much an extinct species as the dodo. Having done their work and outlived the conditions that gave rise to their existence, they will disappear as other hardy men have disappeared before the march of Western civilization and progress.

Daniel Boone, the typical backwoodsman, was the product of circumstances, his class multiplying and spreading as the tide of emigration surged toward the land of the setting sun. As conditions changed so did the character of these frontier-men change to suit them. The trapper, the mountaineer, the Santa Fe trader, the cowboy and the prospector have appeared successively on the scene, each in turn having been evolved from the ever-changing conditions that obtained in the Great West. When the surroundings shall have so altered that there will be

no longer a call or even a place for this class of men, they will, like the buffalo and the Indian, wholly disappear, some of them having already passed away.

But for their names attached to some river, lake or other natural object, there would be little to remind us that the hunters, trappers and other servants of the great fur companies had ever traversed the interior of the continent, there being, except the names of some stockaded posts, just as little on the vast plains of the Central West to attest the presence there of the mountaineer and the Indian trader. As have these other pioneers of the wilderness vanished, so after a little will the prospector vanish from the earth, leaving hardly any record or memento of his existence save the names borne by the bars, gulches and diggings he was the first to discover.

THE Alpha mine at Rye Patch, Nevada, has been sold to a Reno company for \$20,000.

## CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

## The Buchanan Mine.

EDITORS PRESS:—In looking over your useful paper of March 3d, I see quite a number of mines mentioned in Tuolumne county. However, the largest and most extensive mine in the county and the largest hullion-producer was not mentioned. I will therefore give you a little information in regard to the Buchanan property, which is situated 14 miles east of Sonora and is reached by one of the best mountain roads in the State. The elevation of the Buchanan is 3200 feet. The Buchanan mine forms a small village of itself. There is any quantity of timber.

The Buchanan Co. last summer put in 3000 cords of wood at the mill and mine, and the present summer the company intends putting up electric works to run the mill and mine. Water is supplied the mill by a flume five miles in length, which conveys the water from Hunter canyon to the Buchanan mill. This mill is one of the most complete 20-stamp mills on the coast. The mill has run steadily night and day since it was constructed, which was one year ago last July. It is supplied with ore from the mine by automatic cars, the mill being a distance of 500 feet from the mine.

The mill is supplied with all the late improved gold-saving appliances. There are eight Froe concentrators. There are 300 tons of sulphurets stored, which will work \$200 per ton, a little bonanza of itself. The company contemplates putting up chlorination works as soon as they can make satisfactory arrangements for the plant. The mine has hoisting works, charge-room, blacksmith shop, store-room, two large steam boilers 18x54, two large duplex air compressors 12x20, of the Rix patent, which are used for pumping water out of the mine in connection with two underground pumps. There is one Worthington duplex pump at the fifth level, which pumps the water to the second level, and one Garrett pump at the second level, which pumps the water to the surface. There are also two National drilling machines in use which are run by compressed air. The present depth of the mine is 660 feet, and they are still sinking. The fifth level is reached by a two-compartment shaft (inclined) and at each 100 feet is a station, with drifts running each way on the ledge. The ore body is from 8 feet to 40 feet wide, and carries free-milling gold ore.

East of the 500-foot station there is a pair of hoisting engines used in sinking the incline, which is at present 160 feet below the fifth level and in a large body of high-grade ore. This was satisfactorily shown by the last cleanup, which resulted in the largest bullion shipment that the mill ever turned out in 28 days. It is the intention of the company to sink the incline down to 1000 feet, out a station each 100 feet and drift each way. At present the company is only taking out ore in places where work is necessary to be done to open up the mine. There is at present ore enough in eight to keep a 40-stamp mill running for years. The company contemplates adding 20 more stamps to the present mill of 20 stamps.

There are 60 men on the payrolls, and in a couple of weeks they will also have about 30 men at work in the woods getting out wood, timber and lagging.

The company has a large hoarding-house and a number of dwelling-houses which are occupied by employees. They pay good wages and make everything as comfortable and as agreeable as possible for the men employed at the mine.

In connection with the premises is a large store where the men are supplied with all necessities. A stage runs to Sonora twice a week in winter and three times a week in the summer-time carrying U. S. mail and passengers.

About one mile north from the Buchanan mine is the Gold Hunter's mill and mine which is in operation. The mill and hoisting works are run by a 45-foot diameter overshot water-wheel. The mill has 10 stamps.

The mine is mostly worked by tunnels at present, but in a short time they contemplate sinking the Hunter shaft to a greater depth. So much for the Buchanan and Hunter property, which are owned by two gentlemen of San Francisco.

J. S. H.

Buchanan Mine, Sonora, Tuolumne Co.

## The Soderling Amalgamating Pan.

EDITORS PRESS:—The description you gave of my amalgamating pan in the PRESS of March 10th was generally correct, but there is one thing to which I wish particularly to call attention in connection with it. With an additional cost of one-fourth in fuel, my pan will do in 2½ hours' time the same amount of work that can be done by any other pan in 5 hours' time, and, further, give an increase in yield of 30 per cent of contents in precious metals in tailings treated. Therefore in erecting mills I claim for my pan the following advantages:

That by the use of the slotted ring or supplementary muller a pan can be built that will work a charge of 10 tons and will extract a higher percentage in less (or two-thirds the time) than can be done by any pan now in use. This with, say only four pans of five tons capacity each, running three hours to a charge,

would work 150 tons per day, which, from above-stated facts, would be a great benefit and saving in cost of erecting a plant. It would also require less machinery with gears and long shafting, smaller buildings, and could be run at a very little more than one-half the expense required to run any other style of mill with equal capacity.

Bodie, Mono Co.

## Soulsbyville Mines.

EDITORS PRESS:—Our town has been quite dull for several years past, but the mines look very favorable and will make times lively this summer, and will give employment to a large number of men.

The Black Oak Mining and Milling Company has decided to put up new works at their mine and mill, to be run by water-power. The ditch to the Platt and Gilson mines is being enlarged to carry sufficient water to supply them. About 500-feet fall can be had by taking the water from this ditch. They have been running the mine and mill altogether by steam, and I suppose they have found out that wood is most too expensive when water-power can be had for less than one-half what it costs to run by steam. The mine is looking splendidly. One of the managers informs me that they have another chute of high-grade ore. The average width of the vein is six feet. This is a valuable mine, and the owners deserve success, as they have spent several thousands in opening the property.

There are now 15 men employed at the North Star mine. They are taking out some good-looking ore from the two bottom drifts, and the vein is several feet wide. The mill was started last week. This company has also commenced work on the Luavia mine east of the North Star. They have rented an engine and it is now on the ground and will be put in place in a few days. They are using steam at both mill and hoist, but after the mines are thoroughly opened and proved good they will most likely get water-power. Over 500-feet pressure can be had by taking the water from the Soulsbyville branch ditch.

J. L. Coles, now of New York City, who spent considerable money in the Soulsby and Bowden mine three or four years ago, has with his brother, D. H. Coles, invented three machines and patented them. If they make a success of them he will return to this county and reopen the mine. The ore taken out of this mine yielded \$70 and over per ton. The sulphurets are also very good. It is supposed by many that this mine is the north extension of the Soulsby.

In stripping down and cleaning out the old shaft at the Platt mine last week, a fine chute of ore was opened. It is said to be very rich. By standing 10 feet away, gold can be seen in the vein. They have put the pipe in place and the hoisting works will soon be completed. They will then commence sinking the shaft.

I was shown some very fine ore this week by B. F. Lowe, which was taken out of the Woodpecker mine, he being one of the parties who has it bonded. He says the vein is small and water is a great drawback to them.

Surveyors have been surveying a ditch from the Rising Sun ditch to the Dead Horse mine at Summersville. It is expected that they will have water to the mine before many months.

The Soulsby mine was started this week. They are putting through the mill some very good ore and we hope they have an abundance of it.

Soulsbyville, Cal.

## Squaw Creek Mines.

EDITORS PRESS:—Owing to the storm of March 4th, I could not examine the Squaw Creek mines as thoroughly as desired, there being considerable snow upon the mountains and in the vicinity of the trails and roads. There has been considerable capital invested in the above mines, and I venture to say that it has been rightly made, as I believe the mines are better than represented. The ledges are large and contain uniform pay throughout. The fissure veins of this camp are known to gain in size and richness as depth is increased. The ledges do not make a big blowout on top and then pinch out, as many ledges do. I do not mean pinch out altogether, as this seldom occurs in any mining camp, although it is often said that they do. This is, however, a mistake, for men's money and energy always tire out first. During the last year or two there has been considerable confusion and some failures in and about our mines. I will venture to say, however, that this is mainly on the part of incapable management. The most of the mines now idle have paid well when properly managed, and when we get practical men to take hold of our mines and mills, then old Shasta county will come to the front.

Lower Springs, Shasta Co.

The vein in the Treadwell mine on Douglas island, Alaska, is credited with a breadth of 450 feet, the ore of which assays from \$6 to \$8 a ton. The 200 stamp mill will soon be in readiness to crush 600 tons daily. The cost of mining and milling does not exceed \$1.25 per ton, which will leave a daily net profit of \$2800 to the owners.

## Matting Dry Auriferous Silver Ores.

(Concluded from our last.)

## Discussion.

Dr. Thomas Eggleston, New York City: I have listened to Mr. Austin's paper with the greatest interest. The problem of concentrating the precious metals of poor ores which contain neither copper nor lead is a new one in this country, and has not, to my knowledge, been attempted before on any very large scale, either because of the price of fuel, or because the distinctly American methods of treating ores offered, for the time being, an easier solution. But when there is neither copper nor lead to be used as a conveyor of the gold and silver, the question is a pressing one, and Mr. Austin has suggested an answer of it which, from the careful method of investigation which he has presented to us, I have little doubt will be satisfactory. The problem how to concentrate silver and gold in an iron matte seems at first sight a very simple one. Assuming that there is no other metal to carry off the gold and silver from the iron matte into a metallic regulus below, the problem seems to be to produce an iron sulphide which will contain all the gold and silver, and a siliceous slag so fluid that all the grains of matte will settle out of it, and thus to get rid of all the gangue in a single operation and without producing any chemical change, and thus to concentrate the precious metals. To do this, however, is not so simple. In copper and lead there are either the affinities of the metal or chemical reactions which can be depended upon to produce the concentration; but, although the largest part of the silver and gold found in the world is in some way either combined or associated with sulphur, we do not yet know of any reactions tending to concentration in an iron matte, other than the action of gravity. If it can be ascertained that a compound can be made of gold, silver and iron with some substance, which will be heavier than a compound of sulphur and iron, so that liqation can be effected in the iron matte, producing an alloy which will be so much more dense than the matte that the gold and silver will separate, forming what the English, using the reverberatory furnace, call "bottoms," the problem would be solved; but we do not know as yet of any such alloy. Mr. Austin seems to have solved the problem of simple smelting, and, if there is any such thing as the production of iron bottoms in a shaft furnace, will probably find the method of producing them. Concentration by fusion, which he suggests, is also possible, but it will probably be cheaper to send the first matte to market than to concentrate it by fusion. The use of the *spur of*, while it seems to have the advantage of avoiding engorgements in the furnace, is really only the

## Production of a Matte by Liqation.

It would have been very interesting if Mr. Austin could have given the details of the experiments which led him to the adoption of this furnace, and the abandonment of the *sump-ofen*, which seems the natural furnace for this process, and what attempts were made to overcome the difficulty of too high a heat for the iron sulphide and too little for the slag. In this case there was no necessity of concentration, but if it could have been done, the richer product would have been more marketable, while the poorer products could have easily been re-treated.

Mr. Austin has not touched another subject which would have been of the highest interest to us all, and that is, what the relation of loss by volatilization is in this process to that of the other processes. I have had occasion to point out that, in the ordinary lead smelting, silver might be carried more than a mile without condensation when melted in the presence of considerable quantities of lead containing both arsenic and antimony. The complete absence of these last two metals, and the small amount of lead, will probably make these losses much less, and it would have been very interesting if we could have known what they were. Losses, due to improper chemical constitution or pasty condition of slag, have been long studied, but there is too much taken for granted. Slag as says rarely show the total loss, and I have very little doubt that the search for the difference would throw much light on the proper method of conducting the process. It is to be hoped that these experiments will be continued, and that others will try the same method with the same energy and ability which Mr. Austin has shown.

E. G. Spilehny, New York City (communication to the secretary): Mr. Austin's paper is certainly one of intense interest to all of us who are, in any way, wrestling with the difficult problem of

## Beneficiating Low-Grade Auriferous Pyritic Ores.

Too little attention has, I think, been heretofore paid to the possibilities of economical treatment of such ores, by processes such as that described and practiced by Mr. Austin.

We must not lose sight of the fact, however, that the introduction of this system of matting, or what may be termed "igneous concentration," so far as it is at present developed, would be only economically possible in certain districts and on certain ores. Its success depends fully as much, if not more, than that of water or air concentration on the difference of the specific gravities of the materials treated. We all know that, generally, the gold in sul-

phides is in an infinitesimally fine condition, and, therefore, in order to permit its particles to sink in a molten mass by their superior gravity, it will be not only necessary to have an excessively fluid slag, but some agent must be present which will amalgamate with, and so agglomerate, the gold particles as to permit them to sink by virtue of their superior gravity through the molten slag. In other words, no separation of the metallic particles from the slag is possible, unless these particles are of such a size that the difference of their specific gravity from that of the surrounding fluid is enough to overcome the friction of the fluid on the surface of the particles, which tends to hold them in suspension. Iron alone does not appear to amalgamate readily with gold. It, therefore, seems to me that the process necessarily requires the presence of either silver, copper or lead to make it thoroughly successful. Mr. Austin, as I understand it, himself admits this, and thus corroborates the results obtained by myself in experimenting on plain auriferous pyrites.

To be able to run successfully in a blast-furnace, it would also be necessary that at least a large proportion of the ore should be in lumps—a condition which would probably preclude the economical application of Mr. Austin's process to the treatment of fine auriferous iron sulphides, resulting exclusively from stamp-mills or concentration works.

Still, notwithstanding the possibly only local application of the system to certain districts, the fact remains that Mr. Austin is entitled to the credit of having initiated and perfected what is really in this country a new metallurgical process, that of matting auriferous silver-bearing iron sulphides, and so has made possible the treatment by fire-concentration of certain deposits in Montana of low-grade gold and silver ores which could not heretofore be utilized with any profit.

C. Kirchhoff, Jr., New York City (communication to the secretary): Mr. Austin's practice at Toston is valuable, as showing that under special circumstances matting pyritic silver and gold ores may prove the most economical. In the absence of a comparative statement of the costs from ore to marketable product with the method adopted and with lead-smelting, purchasing ores, it is difficult to draw any inferences how widely, territorially, matte-smelting is applicable. One point indicates that circumstances were locally more in its favor than is likely to be the case in any but isolated instances. It will be noted that the freight charge is only \$1.50. On the other hand, Mr. Austin, in the case of base bullion, throws the entire treatment and freight charges on the precious metals, when naturally the lead bears a part of the burden. This method of computation is fair only when it can be proved, as, indeed, happens in some cases that the price paid for the lead in the ore is equal to or even greater than can be realized for it as bullion.

Mr. Austin (communication to the secretary): The inference drawn by Mr. Spilsbury that the

## Success of this Process

Depends wholly upon the difference in specific weights of the various bodies involved is, in the main, correct; yet only so far as the same words might apply to any other smelting process.

That the gold contained in iron pyrites is in the metallic state, divided up in infinitesimal particles, and is collected out of a viscous, highly siliceous slag by alloying itself with the one or two per cent of silver, copper or lead contained in the matte, is improvable. The minute particles of gold could not separate in the metallic state out of a thick oily slag in the short period allowed them for such a purpose; and as the other metals mentioned above go into the matte in combination with sulphur, in the form of sulpho-salts, there remains no metallic body with which the gold could alloy itself. Hence it seems possible that it also enters the matte chemically combined.

Gold builds sulphur salts with the alkalis in the same way as does silver. Silver goes a step farther, and combining with sulphur and iron, gives us the mineral Sternbergite ( $\text{Ag}_2\text{S} + 2\text{FeS}$ ). May there not also be a combination of sulphide of gold and sulphide of iron, or some other metallic sulphide? Unless some such explanation is admissible, it is difficult to understand why the collection of the gold in the matte should be comparatively more perfect than that of the silver.

Bloxam ("Chemistry," edition 1867, p. 403) writes: "In smelting the ores of gold in Hungary, the metal is concentrated by means of sulphide of iron. The ore consists of quartz and iron pyrites (bisulphide of iron) containing a little gold. On fusing the crushed ore with lime, to flux the quartz, the pyrites loses half its sulphur, and becomes sulphide of iron ( $\text{FeS}$ ), which fuses and sinks below the slag, carrying with it the whole of the gold."

This idea of fusing the raw sulphurets with lime has, in two instances at least, been tried on this continent with results highly encouraging to further experiment.

In this connection one is reminded of the fact that the condition of the gold in iron pyrites has never been satisfactorily demonstrated.

As regards the smelting of fine pyrites, concentrates for instance, in a blast furnace, this can be done by running the charge very low, as is common practice with copper smelters in the West, when a strong reducing action is not necessary. The blast in such a case passes up through the charge freely, keeping the whole

mass in a condition—for want of a better simile, I will say—like that of boiling water in a pot. Of course, dust chambers are a necessity when this is done.

Or, the reverberatory furnace might be used for treating such line material. At Freiberg, when matting was extensively carried on, the reverberatory was used in preference to the blast furnace.

#### The Adaptability of this Process.

Assisted by modern improvements in furnaces and associated appliances, is capable of extension; and the available market for iron matte is of itself an inducement to investigate the matter further. Recently a treatment charge was made us of \$2 per ton on iron matte, with the possibility of even that small tax being stricken out. This amounts to practically paying for the iron contents!

Investigations on several details which readily suggest themselves, connected with the subject under discussion, are being followed up, but on account of their incompleteness have not been touched upon in this paper. The results of this work, if successful (and there is much encouragement), I hope at some future date to lay before the members of the Institute.

In reply to Mr. Kirchhoff's comments, I would say that the costs of producing matte or bullion are about equal; furnaces of the same capacity are used, requiring approximately the same amounts of fuel and labor. The freight charges of \$1.50 per ton referred to must be taken in connection with a treatment charge of \$15, making a total of \$16.50. Another bid for this product was freight \$11.95 per ton and treatment \$2; total, \$13.95, which goes to prove that the matter of freight does not seriously influence the results given. As previously stated, lead ores are at a premium in Montana.

F. W. Clark, Boston, Mass. (communication to the secretary): I think Mr. Austin has opened up

#### A Very Promising Field.

And has practically demonstrated that under certain conditions gold and silver can be economically concentrated in an iron matte, making it possible to treat a certain class of ores not desired by the millman or lead smelter. Our experiments on the Haile mine pyrite, sent to us by E. G. Spilbury, were not at all successful, as will be seen by referring to his paper. They confirmed smaller tests previously made by him. The material operated upon was raw and roasted auriferous pyrite, containing 10 to 35 per cent of silica, melted without flux in a small reverberatory furnace (hearth 3½ feet by 3½ feet) and tapped into molds. All our slag carried gold, from 0.5 oz. to 1.64 oz. per ton, and the matte contained from 1.2 to 8.5 oz. per ton. The slag carried no visible matte, except where it lay on the matte-cake. The slag probably contained matte in a dissolved state, like sugar in water; and the gold in the slag was, I believe, in a combined state, since repeated assays of clean slag would yield the same result. Mr. Austin's results confirm the opinion I formed at that time, that, for successful working, some other metallic sulphide than iron must be present in the matte, and that the slag must contain some other base than iron. I suggested at the conclusion of our experiments that we brick the ore with lime and smelt in the blast furnace, making a slag containing 12 to 15 per cent CaO, and expected much better results by this treatment; but owing to the total absence of limestone in the vicinity of the Haile mine, which would render the shaft-furnace and lime slag impracticable in practice, this experiment was not tried. As Mr. Austin remarks, laboratory experiments are not conclusive, and I have no doubt that far better results would be obtained on a large scale with properly constructed furnaces, longer time, addition of a little lime, thorough riddling, etc. But that slag sufficiently low in gold to be thrown away can be obtained, I doubt. Mr. Austin's matte undoubtedly contained lead, if metallic lead was reduced. The fact that

#### Gold-Bearing Sulphurets

Are neonally in a fine state does not appear to be a serious objection, as a partial roasting is in any case necessary to obtain the iron oxide to flux the siliceous ore. After roasting, a certain amount of sulphate of iron is present, and if a little lime (five per cent or less) is added, and the mixture air-dried, it will be sufficiently coherent to stand a moderate amount of handling, and will work well in a low blast-furnace without giving an excessive amount of flue-dust.

If both siliceous ore and pyrite be fine, why not mix them, partially roast and slag, and then smelt in the blast furnace? If the *spur* of type of furnace is used, and the slags are kept below 40 to 42 per cent SiO<sub>2</sub>, the smelting should not be difficult.

It has been suggested, since the experiments were made on the Haile concentrates, that, if after the charge in the reverberatory was thoroughly melted, a little raw iron or copper sulphide had been sprinkled on the charge, and the heat had been raised, it might have carried with it the gold in the slag.

THERE is a probability that the Panoche coal mines will be developed at once. The coal is pronounced equal to Wellington, but is 18 miles from the railroad, in Fresno county.

JOEL F. LIGHTNER has again been appointed secretary of the Hale and Norcross mine. This is the 28th year he has served in that capacity.

## Metallurgy of Zinc.

### Calamine.

Some mineralogists object to the use of the term "calamine" when applied to the carbonate of zinc, but on putting the question to Melville Attwood of this city, he at once said it was the common English name for the pure carbonate of zinc, and furnished us with the following authorities, and also some interesting particulars respecting the metallurgy of zinc:

1st. "Alger's Phillips' Mineralogy," Boston, 1844, page 567: "Calamine," carbonate of zinc, from the Latin *calamus*, a reed. It is found in Tarnowitz, in Silesia, Aix-la-Chapelle, Matlock in Derbyshire, Alston Moor in Cumberland.

2d. "Handbook of Geological Terms and Geology," by David Page, F. G. S., 1859, London, page 101: Calamine, the common name for the carbonate of zinc.

31. "A Dictionary of Chemistry," by Henry Watts, Vol. I, page 713: "Calamine," native carbonate of zinc.

4th. "A Practical Treatise on Metallurgy," by Crookes and Rohrig. Lead, silver and zinc. London, 1868, page 403: "Calamine." This general name is given to the combination of the oxide of zinc with carbonic acid, page 434: The Belgian process—treatment of calamine at Morenet Vieille Montagne near Aix-la-Chapelle. The calamine occurring in this neighborhood is partly calcined in large kilns and partly in reverberatory furnaces, after having been ground by edge-mills and combined so as to contain 50 per cent of zinc.

5th. "Dr. Ure's Dictionary of Arts, Manufactures, etc.," page 165: Brase, an alloy of copper and zinc. It was formerly manufactured by cementing granulated copper with calcined calamine—native carbonate of zinc.

6th. "Elementary Course of Geology," Olmsted, London, 1850, page 212: "Calamine," carbonate of zinc. This is the usual ore of zinc, and the metal is obtained from it by distillation. Electric calamine was long confounded with calamine; it is, however, a true silicate of zinc.

7th. "Manual of Metallurgy or Practical Treatise on the Chemistry of Metals," by John A. Phillips, London, 1859, pages 413 and 414: "Calamine," carbonate of zinc—zinc carbonate—the silicate of zinc electric calamine. This mineral was for a long time confounded with carbonate of zinc, although they differ materially from each other both in their chemical and physical properties.

8th. "Manual of Metallurgy," G. H. Makins, London, 1862, page 398: "Native carbonate of zinc or calamine is an abundant ore, not only in our own country, but also in Belgium, Silesia and the United States. It contains 60 per cent of oxide of zinc and 35 carbonic acid."

9th. "The Playbook of Metals," by John Henry Pepper, London, 1862, page 496: "Carbonate of zinc. Calamine, oxide of zinc and carbonic acid and water."

10th. "Elements of Mineralogy," by Richard Kirwan of the academies of Stockholm, Upsal, Berlin, etc., London, 1796, Vol. II, page 232: "Zinc—calamine, galena of Werner—mineralized by oxygen, with or without forced air. Of this species we may distinguish three families—the loose or pliable, the compact and the etriated. It is frequent in China, and there called wohan, or ore of Tatenago."

11th. "A Treatise on a Section of the Strata from Newcastle-upon-Tyne to the Mountain of Cross Fell in Cumberland," 1821, London, page 260: "Langley Zinc Works, using calamine, black jack, etc."

12th. "The Useful Metals and Their Alloys," by John Scofield, William Tennant, William Clay, Robert Oxland (mineral chemist, Plymouth), William Fairbairn, F. R. S., W. C. Aitkin and William Vose Pickett, London, 1857, page 152: "Zinc. This metal was first obtained in a metallic state early in the sixteenth century, but for a long period subsequent to its discovery the production of metallic zinc as one of the useful metals remained in abeyance. Calamine, a carbonate of the metal, was employed in the crude state for alloying with copper in the production of brass."

13th. "Percy's Metallurgy," by John Percy, M. D., London, 1861, page 612: "Preparation of Brase. Until a comparatively recent period all brass was made by the old process of 'cementation,' which has been almost entirely superseded by that of alloying zinc in the metallic state directly with copper. Manufacture of calamine brase. Only a few years ago I saw the old process carried on in Birmingham at M. Pemberton's works. Calamine brase works were established in Bristol about 1702, and afterward at Cheddle, Staffordshire, about 1720." Page 549: "Hydrated silicate of zinc or electric calamine. In some mineralogical works this mineral is described under the same name as common calamine or carbonate of zinc, and confusion is apt to arise in consequence. Thence the name Smithsonite is applied to it in Brooks and Miller's edition of Phillips' Mineralogy, while in Dumas's Treatise the same is applied to carbonate of zinc."

14th. "Chemistry," by William Brande, D. C. L., F. R. S., of Her Majesty's mint, etc., 1863, and Alfred Swaine Taylor, M. D., F. R. S., page 378. "Native Carbonate of Zinc or Calamine." It abounds in Somersetshire, Flintshire and Derbyshire. The variety

known by the name of electric calamine, from its property of becoming electrical when gently heated, consists of oxide of zinc in combination with silica.

15th. "The Principles of Chemistry," by Dr. Julius Adolph Stockhardt, translated by C. H. Pierce, M. D., 1852, page 280: "Carbonate of zinc occurs also in nature most abundantly in Silesia, Westphalia, and Belgium. It is the most important zinc ore, and metallic zinc is generally prepared from it in the above mentioned places. The miners call this ore calamine."

16th. "Elements of Chemistry," by J. L. Comstock, M. D., New York, 1854, page 301: "Calamine zinc never occurs in the native or pure state, but is always found combined either with sulphur, carbonic acid or oxygen. The sulphuret of this metal called zinc blende and the carbonate called calamine are the ores from which zinc is obtained."

17th. "Manual of Chemistry," Geo. Fownes, London, 1854, page 286: "The native carbonate or 'calamine' is the most valuable of the zinc ores."

18th. "J. J. Barzillieu on the Use of the Blowpipe," 1855, page 195: "Carbonate of zinc, 'calamine,'"

19th. "Plattner on the Use of the Blowpipe," edited by Dr. Sheridan Muspratt, page 151: "Zinc is found in nature as a carbonate in calamine."

### The Miners' Side.

#### They Petition Congress in Behalf of the Biggs Bill.

A petition, of which the following is a copy, is being circulated for signatures and is being generally subscribed to in the mining counties of the State:

The undersigned, miners and residents in the gold-mining belt of California, respectfully ask for and urge the passage of the bill introduced in the House of Representatives by the Hon. Merion Biggs, and having for its object the survey by Government engineers of the rivers and streams of the State affected by mining debris. And we would further memorialize Congress in relation to the question involved.

Forty years have now gone by since the new reached the Atlantic Coast of the discovery of gold in California. That discovery excited the world, and led to the rapid settlement of the Pacific shore. Mining was the paramount industry of California for years, and was so declared by one of her early Legislatures. In hundreds of cases the rights of miners had been defined by the courts and settled. Congress had recognized the mining laws made by districts and the State Legislature, and has partitioned mining lands and sold them at high rates, knowing that they were to be washed away and the debris deposited in the streams. An amount of gold had been taken from the western slope of the Sierra Nevada equal to the national debt, enriching the whole nation. Without the vast production of California gold, the nation could not have maintained its credit and survived the War of the Rebellion. The costly lakes and canals we had constructed for mining purposes, the labor we had expended and privations we had endured for years, the investment of the fruits of our toil, the knowledge of the benefits of our mining to the world, as well as the recognized rights conceded to us by almost every civil authority, had led us to believe our rights as miners were indefeasible. In the confident expectation of realizing a competence at last from our long toil and investments, we had made our homes by the mines, and children were born and reared to a knowledge of mining alone as an industry.

In an evil hour for us came decisions from the courts of the United States—decisions based on riparian law to which from the whole time of the American occupation of the mining region of the country we had been total strangers, and had supposed our own experience of a third of a century was a better basis for mining law than the experience of our British ancestors of a thousand years could possibly be, applied to a country so entirely different from that in which they lived. The scope of those decisions dooms all mining of whatever nature. The geological character of the mining region, the location of the mines, and the modes of extracting gold from the soil or rock, necessarily require the deposit of the mining debris at the lowest points. The loosening of soil on slopes by the plowman, as well as the pulverization of soil or rock by the miner, invites the heavy rainfalls of our winters to hear the materials loosened and disintegrated to the valleys. It is the inevitable law of nature. But the courts have issued injunctions against discharging any material from the mines into the streams on the assumption that the navigability of navigable water is sacred, and must not be impaired. They have gone further. When the miners at great expense have built restraining dams to hold their debris, the courts have assumed to know more than skilled engineers of the strength and efficiency of these dams, and have prevented their use, punishing with fines and threatened imprisonment to the builders. More than this, the courts declare that it is not their business to take cognizance of the damage their decisions inflict upon miners, but that it is their duty to give relief to the complainant however little be his injury, even if that injury be not real but assumed to be prospective. And thus property to the value of hundreds of millions of dollars has been destroyed by the fiat of the courts, and thousands of men have been thrown

out of employment, despoiled of their all and reduced to poverty. The gravel gold mining region of California which has enriched the world with its wealth, and which is comparatively yet untouched, is a scene of ruin and desolation. The plea is diligently uttered that no designs are entertained against mining by the drift and quartz crushing processes. But it is the siren song to lull some into fancied security while the conquering goes on in detail. The courts hold out no such hopes to any mode of mining. Their blows are leveled at any process that dumps debris into streams. Drift miners have been enjoined, and every miner is at the mercy of any blackmailer, or any one mean enough to make a complaint. Miners working on a small scale have been stopped in Plumas county, more than 100 miles away from the field of alleged damage, and that damage only prospective.

Your petitioners would further respectfully represent that the mountain streams flowing from the Sierras to the great California valley contain the accumulated debris of the mining of years, which eminent engineers and the courts declare threatens to overwhelm the people and property at the debouchure of these streams with an avalanche of sludges. The survey contemplated in the bill of Mr. Biggs is with the view to determine what can be done to ward away the damage to the inhabitants of the plains and to their property. Taking an intelligent view of the situation, the Legislature of the State last year by a vote unanimously favored the action contemplated by the bill in question. Thirty of the most eminent engineers the Pacific Coast has known, among them Col. Mendell and Capt. Eids, have testified to the needs of restraining dams, and that they can be constructed to stop the flow of the debris already in the streams and allow mining to continue. We, your petitioners, ask that a thorough survey of the debris laden rivers be made as a measure looking to the safety of life and property in the valleys which we would not have a scene of distress and desolation like that around our own mountain homes. We ask it in the hope that when the work is done it will be found that mining can continue, with wise precautions, with safety to all, and with the firm belief that such survey will show a just government the despotism of the courts toward us, and will hasten to relieve us from their domination by placing mining under the protection and direction of positive statutory law. It may be that some very valuable mines will have to remain closed, but we know that there are hundreds of mines of untold value, which with proper safeguards will yield millions of money, but are now the prey of the spy, the blackmailer and the interpreter of riparian law of a barbarous age. Your petitioners would invite the attention of Congress to the logic of the decisions of the courts touching the "sacredness of the navigable waters." In effect it relegate the country to barrenness and uninhabitability, for the day is fast approaching when the soil will no longer produce the cereals with profit, and large areas can only yield other productions with irrigation. The diversion of water for irrigation decreases its depth in navigable streams and injures their navigation. The waters of our rivers properly utilized will enable California to support a population of thirty million people. Can the navigability of navigable waters be more sacred than the lives of millions? It may thus be seen that the decision of the courts sit like incubi upon the future agricultural growth of the State, as they now do upon mining. They invite the serious attention of statesmen, and to statesmen we make this earnest appeal.

**A SALT TRADEMARK.**—The American Salt Company has commenced suit in the Superior Court against the firm of Alfred McGrothy & Co. to recover \$25,000 damages for an infringement of trademark. The plaintiffs stated that on May 18, 1882, they purchased from S. O. Putnam, Patricio Marciano and C. B. Tilley, the right to manufacture a certain brand of Carmen Island salt. They have secured a legal trademark bearing the words, "Premium American Salt Company, warranted pure extra refined Carmen Island Dairy and Table Salt," which, it is alleged, the defendants are using on imitation or counterfeit of. The plaintiffs pray that an injunction be granted, that the defendants be compelled to account for their sales of salt with this trademark on it, and for \$25,000 damages.

**INCREASE IN THE SOUTHERN PACIFIC RECEIPTS.**—Colonel Crocker stated to a reporter that the gross receipts of the Southern Pacific system from January 1st to March 10th showed an increase of 47 per cent in comparison with those of the same period of 1887. The February receipts were considerably larger than those for January, while the March receipts will, in all probability, be larger still. The increase, Colonel Crocker stated, is a phenomenal one and is very gratifying to the directors. The operating expense this year, however, are going to be very heavy, as immense sums will be spent in providing new equipments and in repairing the road-bed.

**THE CARSON MINT.**—The President has sent to the Senate the nomination of John H. Dennis to be melter and refiner of the mint at Carson, Nev. Mr. Dennis has been deputy United States revenue collector for the district of Utah since June, 1886. He was in the California Legislature in 1861 and 1862, and has been repeatedly elected State senator in Nevada.

#### Passing Events.

The River and Harbor bill reported favorably in Congress gives this coast larger appropriations than ever before. California, Oregon and Washington all fare very well. Among other things there is an innovation in providing for permanent moorings on the northern coast, where the harbor facilities are poor.

The mining community of Nevada county is in quite an excited state over the recent outrages committed there. Incendiarism and the use of dynamite never helped any cause, nor will it effect any solution of the question of miners' wages. The individuals who have committed the outrages would be roughly treated if caught.

The Comstock lode is gradually increasing its daily hulsion product, and before long it is expected that there will be several dividend-paying mines.

Castle district, Meagher county, Montana, is coming to the front as the most promising of the new mining camps in the Rocky mountains. Among other things they have the finest flux yet discovered in the country, supplying the deficiency of the great smelting industry of the Territory.

In this State the prospects for quartz mining were never better. It is thought that this season a number of old mines will be reopened. They can now work gold ores in California cheaper than anywhere else in the world.

#### Mineral and Agricultural Lands.

Several references have been made in the PRESS of late to the fact that considerable mineral land had been taken up as agricultural, owing to the faulty manner in which the laws are carried out. The people in Montana are now engaged in bringing the subject to the attention of Congress, in connection with the railroad land grants, where large tracts of mineral land are being patented, though the grante especially except that class of land. In this State, and elsewhere on the coast, more or less mineral land is now covered by agricultural patents. As when the patent is issued, whatever mineral there may be is covered by it, the area for prospecting is gradually very diminished.

We see now that a test case is to be brought before the courts in this State, to decide whether land that has been entered as agricultural and patented as such, when found to be mineral can be held by the patentee. A Tuolumne county mining syndicate has located nearly the entirety of Wolfing's hill for mining purposes. This land, as we understand from the *Sonora Democrat*, has already been entered and patented as agricultural.

While it is doubtful whether the land so patented can be taken away from the locator and restored to the public domain unless fraud can be shown, it will be a good thing to have the subject tested. There are hundreds of similar cases all over the coast. It will be difficult to invalidate the agricultural patent. Nevertheless, the lax method by which land containing minerals is entered as agricultural should be remedied; and the fact that the miners are awakening to a sense of their rights is a good sign. There are many regions known to be mineral-bearing to mining people, but agricultural people would not know them as such, and, as in getting the patents the testimony required is only negative, the agriculturists can very well testify that they know of no minerals. Unless some miners are interested in the special locality they will not take the trouble to volunteer testimony. The patent issues, and when mineral is found it belongs to the man who took up the land as agricultural.

#### Stock-Board Mining.

It is rather a good sign when people up on the Comstock lode conclude that it is not any business of the San Francisco brokers how the mines are managed. Time was when the lode was pretty much "run" by the stock board. A committee was recently appointed by the San Francisco Stock Exchange to investigate Comstock mining management, but the people up there do not see that it is any business of theirs anyhow. The brokers generally do not own any portions of the mines, and though it would be a good thing to give people who buy stocks some assurance that everything is fair and above-board, it is difficult to see how the brokers can do much.

The truth is, the mines are being worked more for ore in these days than for stock-board purposes. There has been no stock excitement here for many a day. People are shy of buying, as they have been taken in so many times. The mines on the lode are now producing \$600,000 or \$700,000, with prospects of an increase, and they can afford to feel independent of stock-board influences.

Experience long since proved that mines could be worked very well without any of the machinery of stock exchanges. There are very few California mines listed on our boards, and those that are do not comprise our best ones. The lists now mainly comprise Nevada properties, and these are gradually getting out of the influence of the stock sharps in the exchanges. The stock exchanges here do very little business as compared with former days, and where they have been formed in other cities they have eventually proved failures.

There never was any guarantee by the Board of Brokers that the mines listed were legitimate mining ventures. A stated fee was required, and this paid, no questions were asked. As a result, a lot of "wildcats" were palmed off on the public by the promoters. So many tricks were played on buyers that the buyers finally got disgusted and quit the business. There are still a few left, of course, but the number grows less month by month. The

brokers have hard work to make a living in these days. But the mines are in better shape than they have been for years. The decadence of the stock business is marked by an increase in the interest of legitimate mining.

#### The Mining and Scientific Press.

Now that the mining season is about to open all over the Pacific Coast, it will be well for the miners to remember that in addition to the support they ought to give to their local papers, they should also lend their aid in maintaining the MINING AND SCIENTIFIC PRESS, which has for so many successive years been the representative of the mining industry on this coast. Our readers who have been with us so long should call the attention of others to the benefit to be derived from the PRESS. It is our endeavor to collate from all available sources, far and near, each matter as will be of interest and value to the mining community. We keep close watch on all improvements in mining, milling, etc., and describe what is being done, and where it is being done. We also give illustrations of each new mechanical appliances as are adapted to the wants of our Pacific Coast progressive communities.

In every number of the PRESS are several communications from different regions. This correspondence is specially useful to our readers, giving them as it does information concerning the camps from people who live there. Our regular two pages of mining summary gives in a condensed form the current news of large and small districts and camps, and serves to keep all interested well posted on what is going on.

The mechanical and scientific progress, engineering and other departments are carefully looked to, and such things are given as are of value and general interest. In short, it is the desire of the publishers and editors to make the PRESS a journal of practical matters which shall be useful to its readers.

The MINING AND SCIENTIFIC PRESS is the oldest paper devoted to mining in the United States. The experience of its conductors enables them to obtain the class of matter most desired by the mining communities. The mining industry has grown in importance of late years, and a wider range of subjects has been the result. Nevertheless we have endeavored to keep pace with the progress of the day, and feel assured that our efforts are appreciated. Many new-comers to the coast would be benefited by becoming regular readers, and we trust to our old subscribers to call their attention to this fact.

#### Trademark Infringements.

A case for infringement of a merchant's trademark was decided by U. S. Circuit Judge Sawyer this week in favor of the plaintiff. The suit was one where the name or trademark of a well-known manufacturer of hoots was placed on the hoots made by another firm. Some 250 dozen of the illegally marked hoots had been sold. The judge said that the defendants insisted that the measure of damages, or profits, should be limited to the difference in price for which the goods would sell with the trademark upon them and the price for which the same goods would sell without it. He was unable to adopt any such rule. It would be exceedingly indefinite and equivalent to giving no damages or profits at all. How would it be possible for any one to say how much less a pair of hoots or shoes would sell without than with the trademark upon it? There would be no definite measure of compensation for the injury. One who deliberately and knowingly uses another's trademark commits a palpable and unmitigated fraud, for which there is no possible excuse. He seeks to avail himself of the reputation of another's goods, usually, if not always, of an inferior quality, upon the market, thereby not only fraudulently cutting off the market from the party, who has, by years of labor and at great expense, established a reputation for his wares, but in addition to this injury destroys, or injures largely, that reputation which is the foundation for the owner's business, by selling inferior goods under his trademark.

In concluding his decision Judge Sawyer made the following very pointed remarks concerning improvements: "In my judgment the infringer should at least account for the entire profits made upon the goods wrongfully sold with the trademark impressed thereon. There

may also be damages beyond the mere profits resulting to the owner of the trademark infringed, which he may recover. I do not think there is any just analogy with respect to profits and damages between the infringement of a trademark and a patent for an improvement in a machine. A machine may embrace inventions for half a dozen improvements, for each of which there is a patent held by different individuals. One machine might infringe them all. In such case each would be entitled to recover the profits attributable to his own invention, and not the profits made upon the machine as an entirety. There is no analogy to such a case on the infringement of a trademark. The infringer fraudulently attaching another man's property to his own occasions only a confusion of property, with a view of taking advantage of that other's property. The trademark sells the whole article, however inferior and injurious in that particular, and prevents the sale of the owner's goods of equal amount. At least that is the fraudulent purpose and the natural tendency, whether always accomplished or not, and the injured party should have at least the whole profit resulting from the wrongful act, and such I understand and hold the rule to be. His damages may be more, arising from destroying the reputation of the goods. Let there be a decree for the complainant, in pursuance of the prayer of the bill."

#### The Dismemberment of Idaho.

That portion of Idaho which it is sought to have added to Washington Territory comprises within it the Coeur d'Alene and other important mining districts. Here the alien law is in force, the inhabitants, in the hope of relieving themselves from its restrictions, have very likely been induced to favor this annexation scheme, there being a good prospect that their neighbor on the west will soon be erected into a State and so escape the operations of this odious and impolitic law. But if this were the object had in view by these annexationists, the reason for their action fails now that the objectionable law, in so far as it applies to the purchase of mines, will undoubtedly be repealed by the present Congress.

Other than the above, we fail to see any good reason for the proposed mutilation of Idaho, the reasons why such measure should be defeated being many and obvious.

Idaho, at the rate she is progressing in population, wealth and improvements, will in the course of a few years be herself applying for admission to the Union. Her area is not much larger than that of Washington, the latter in her much greater extent of arable land possessing advantages that more than make up for this difference in size. But both of these Territories are now compact and symmetrical in shape, being bounded on nearly all sides by right lines. Violent curves and angles are avoided. At no point do unsightly protrusions extend into adjacent territory. To detach the northern end of Idaho and add it to Washington would alter all this, the area of the former being at the same time reduced to an objectionable extent.

It is desirable that Idaho as well as the other Territories occupying the great arid interior should include large areas within their boundaries, since none of them can ever become very populous, owing to the great amount of mountainous and unproductive land they contain. It is to be hoped, therefore, that the present dimensions of Idaho will suffer no curtailment. Than this, better take from Montana, her much larger neighbor on the east, a triangular strip of country, and add it to the "Gem of the Mountains," a measure which, besides more nearly equalizing the two, would somewhat improve the shape of both.

ONE of the Oakland ferry steamers is now lighted by electric lights, and the system is to be adopted on the other steamers. The Piedmont now has 140 electric lights of 20-candle power each. The relative cost of the light is said to be no greater for the 140 electric lights than was the expense of the 60 coal-oil lamps formerly used.

PROSPECTORS are at work in Siegel district, about 24 miles east of Virginia City, Nevada. Several abandoned mining claims in that vicinity have been relocated.

### The Spanish Tongue in California.

California, since the time of the American occupation, furnishes a notable example of the manner in which the spoken language of a people may grow and wane through the commingling of races speaking different tongues. Prior to the inauguration of the gold-mining era most of the Americans who had arrived in California found it convenient to gain some knowledge of the Spanish, not a few of them mastering it completely. Among the earlier immigrants nearly all the younger members learned to speak the Spanish fluently, the older picking up such words and phrases as were used in the transaction of business, and in conducting the more ordinary affairs of life. The two races saluted each other in either language, the Americans generally conforming to the Spanish mode, as, indeed, the latter people do not, nor have they ever taken readily to the English.

With the influx of immigration consequent on the discovery of gold, the English speedily became the predominating tongue, few of the newcomers trying to learn, or even paying any attention to the Spanish, as in fact there was no longer much need for their doing so. But while this language was so suddenly and almost wholly ignored, there had already been a great many Spanish words added to our vocabulary, some of them having been engrafted on it through sheer necessity, there being in the English no word for expressing the idea intended to be conveyed; and this for the reason that the thing itself had among the Americans no existence. They were obliged to adopt the terms corral, vaquero, rodeo, and the like, simply because there were no such things in the United States, nor had our people ever seen or heard of them. In like manner we had to adhere to the names given the trapping and implements

of the vaquero, and to the caparison of the caballero or horseman, such as tapajo, mochila, tapabero, cincho, lasso, etc. We had to continue calling a certain style of vicious animal a bronco, because the bucking horse was a brute unknown to our people and with which they had happily had no experience.

Some names at first adopted by the Americans have since been wholly or partially dropped and English ones substituted in their stead: *embarcadero* has, with few exceptions, given place to the English term *landing*; *punta* has in most cases yielded to *point*; *pueblo*, to *city*; *presidio*, to *garrison* or *fort*; *rio*, to *river*—and so in many other instances. In designating natural objects, we have sometimes shared the names with the Spanish; thus we have in California ravines and canyons, *arroyos* and creeks, etc. In this State we retain the Spanish name *salinas*, but in Arizona they call a stream marked by the same peculiarities *salt river*. The Spanish *los* has generally had to succumb to the English definite article *the*. Where retained, as in the case of Los Angeles, our people, yielding to the local instinct, manage to give to the *o* the short sound instead of preserving the long sound which that letter has in Spanish. When it came to gold mining, this being an entirely new industry with the Americans, our language was without the terms and the phraseology pertaining to that business, hence the Spanish names such as *placer*, *batea*, *aratra*, etc., were by us accepted and have since been retained. The practice common among miners in early times of rushing off hastily to new diggings having made necessary a term for expressing this peculiar phrase of mining life, the word *stampede*, a corruption of the Spanish *estampada*, was adopted and is still in use. As the practice itself is going out of date, so very likely will the word after a time become obsolete.

Formerly the word *Ranch*, a contraction of

the Spanish *Rancho*, was here in common use, being applied to every kind of landed estate. Since the large Mexican grants have been subdivided and the smaller holdings have come to be cultivated after the American fashion, the English term *farm* has in great measure superseded the Spanish *Rancho*, though chicken ranches, hog ranches, etc., still continue to be spoken of, and for designating these, the phrase is very convenient. Indeed we might well have retained much more which, in primitive times, we had the good sense to accept from that beautiful and expressive language, which, in so far as we have made appropriations from it, has greatly enriched without at all snuffing our mother tongue.

### Foundry Notes.

The Dow Steam Pump Works have placed a large new pump on board the tugboat *Alert*. It will furnish four 2½-inch streams and a cepec-

Fig. 3.—VERTICAL SECTION OF RISDON TURBINE WHEEL.

Fig. 4.—REVOLVING PART OF RISDON TURBINE WHEEL.

Fig. 5.—DOUBLE RISDON WHEEL IN ONE CASE.

ity of 18,000 gallons an hour. The new pump will be used for wrecking purposes.

At Garratt's foundry they are preparing designs for centrifugal pumps to be run by electricity for the Big Bend Tunnel Co. The pumps are to remove seepage water from the river-bed, after the main body of water has been turned into the tunnel. The pumps are to be run under rather peculiar circumstances, and are designed to meet requirements exceedingly varied, as respects the quantity of water to be handled.

The noise about iron foundries, iron mines, and other industries, to the tune of an investment of "at least \$1,000,000," at Chino has ceased, and the Los Angeles *Tribune* intimates that the aforesaid noise was only made for the purpose of selling town and villa lots, and that those lots having been disposed of, the noise will be heard no more forever.

A posse of men from Phoenix overtook and killed one of the Mexican murderers of Cyrus Gribble, superintendent of the Vulture mine, Arizona. They recovered the stolen billion and Mr. Gribble's watch. A search is still being made for the two other murderers.

COAL shows no change in prices. The week's receipts were 29,673 tons, of which only 3040 tons were foreign. A private circular says: The situation is unchanged. The arrivals are barely sufficient to supply pressing demands, hence last week's quotations are fully maintained with no evidence of weakening. The northern collieries are increasing their shipments, but not sufficiently to affect prices. Their late engagements of tonnage would indicate a further increased output, still no softening of values can be looked for until there shall be an accumulation of coal in the yards for distribution, instead of entire cargoes being delivered to consumers from ship's side as at present.

The hoisting works of the "Work Your Own Diggings" claim, Nevada county, were burned on Tuesday of last week. The fire is said to have been of incendiary origin. The fire came as a real calamity to the six young men who are the principal owners in the mine, as they

### Nevada County Miners.

Nevada county is the center of the gold-mining industry of this State. The quartz mines are rich and productive, and are, most of them, actively worked. The mills and metallurgical works are of the best and most skillfully conducted. And it is generally conceded that there are no better gold miners than can be found at Grass Valley and Nevada City. But there have of late been efforts to reduce miners' wages below the \$3 standard, and this has resulted in several unfortunate occurrences, such as the dynamite outrage at the Providence, Champion, and Mountaineer mines, and incendiaries at the "Work Your Own Diggings" hoisting works.

The Nevada City Miners' Union held a meeting on Thursday of last week, when the following expression of sentiments was passed:

"We, the undersigned laboring miners and residents of the Nevada City mining district, believe that considering the cost of the necessities of life in this locality and the peril to which miners are subjected, the special skill required, and the severity of the labor of our employment, it is our duty to protect against the reduction of the wages of skilled underground miners below \$3 per day for a good day's work. We believe that sum to be only a fair compensation, and that the wages of all other employees in and around the mines and mills should be in proportion.

"We further believe that it is our right, if we so desire, to organize and combine by lawful and honorable means to maintain wages at these prices.

"But while we so believe, we unhesitatingly declare that we unqualifiedly reject and repudiate all destruction or injury of property, by any purpose or means whatever, either to maintain wages or to accomplish other personal ends.

"And we further declare our purpose in common with other law-abiding and well-intentioned citizens, to use our influence to enpress and prevent all such violations of the rights and enjoyment of property by its owners, and that we will use all reasonable endeavors to detect and bring to punishment any and all persons who have engaged, or may engage, in such unlawful acts.

"We further declare that in our opinion it is as unjust to charge such evil actions to the miners, as a class, as it would be to call all merchants and tradespeople in the community cheats and dishonest because some few of them may have defrauded their creditors.

"Signed by the president and indorsed by the union. W. B. ROWE, President.

"T. C. WATERS, Secretary."

From this it will be seen that the union repudiates any connection of its members with the recent outrages. Of course the perpetrators are not known, though every effort is being made to ascertain their identity. No doubt the bulk of the miners in the community would like to see the persons punished who have thus thrown discredit on their occupation.

A delegation of about 100 members of the Nevada City union went to Grass Valley last Saturday night and held a meeting to urge the Grass Valley men to form a miners' union—a branch union. Speeches were made concerning the subject of wages. In Nevada City mining district the movement had been made to lower miners' wages to \$2.50, and to how much lower no one could tell. The entering wedge of low wages is \$2.50 a day. The union is resisting this, not by violence, not by unlawful acts, but by banding together and standing out boldly and aboveboard for a reasonable standard of \$3 a day to a skilled miner. Grass Valley miners were urged to join in, but they did not seem to do this very freely, according to the local papers. Only about 30 men signed the roll, but arrangements were made for another meeting in two weeks' time.

SILVER CITY, Idaho, is experiencing a revival. Its mining interests, like those of many other camps, have been depressed from the decline in silver and other metals, but a reaction has taken place which bids fair to make the camp as lively as ever.

THE 221st dividend paid by the Idaho Gold Mining Co., location of works, Grass Valley Mining district, Nevada county, California, aggregated \$23,250, making \$69,750 paid for this year. To date, the dividends paid aggregate \$4,777,000.

THE El Paso smelter people are in trouble over violation of the foreign contract labor law, in bringing 50 Mexicans over to work at the furnace.

WATER-POWER for mining is being introduced in place of steam in this State wherever practicable.

GOLD has been discovered in the Nipissing district, township of Cortier, Canada, within a mile of the Canadian Pacific track. The ore assays \$800 per ton.

WILLIAM F. SMITH, secretary of the California Academy of Sciences, has gone to the Sandwich Islands for a short vacation.

THE New Mexico Territorial mineral exhibition will be held at Socorro next May.

## MECHANICAL PROGRESS.

## Link Belts.

Link belts have come to stay, and as there is no patent on the link itself some new catch somewhere must be protected and fit the links so that they will run in a V groove of a pulley. By making one edge of the link thinner than the other the belt will become so much inclined on the sides that they will wind in the level score to a nicety.

In regard to the above we clip the following from the *Chicago Journal of Commerce*: Leather-link helting was unknown in this country previous to 1885, and although it had been in use in England and France for 25 years previous, it seemed unsuited to our swift running machinery. Mr. Chas. A. Schieren of New York went abroad several times, visited the leading manufacturing districts of Great Britain and the Continent, studied the manufacture of these leather-link belts, and resolved to introduce them into this country. He endeavored to improve these belts and make them suitable to be run on our machines, and in order to do this had several of them made and tested in his own extensive factories. He found that with a few necessary improvements they could be made to do excellent work on our American machinery. Many valuable improvements were invented by him, such as the American patent joint. This joint gives the belt an unbroken, flat surface, and just pliability enough to conform itself to the rounded face of a pulley.

Two bolts are used for each width of belt, allowing the belt to adjust itself to any pulley, whether flat, crowned or cone. The English use only one bolt for each width of belt. By this method the bolts must bend to the rounded face of the pulley before perfect contact can be secured, and in many cases the bolts refuse to bend and therefore break off. Since the introduction of the joint, link belts have been run on all kinds of machinery with great success. They have, moreover, decided advantages over ordinary helting. Every foot of belt is of exactly the same weight; the belt, therefore, runs smoothly. They are claimed to be much more pliable than ordinary belts, to be more easily adjusted to the pulleys, to save cost of lacing, belt hooks, etc., and to stand more strain and last longer than two ordinary belts.

ANOTHER WONDERFUL INVENTION which it is supposed may largely supersede the telegraph and telephone has recently been perfected by Professor Elisha Gray of Chicago. Prof. Gray, it will be recollected, is one of the parties who claims priority over Bell in the telephone invention, but who was not made a party to the recent suit which Bell has won. Prof. Gray, in a recent interview, spoke of his invention as follows: "By this invention you can sit at your office in Chicago, write a message to me, and as your pencil moves a pencil here in my laboratory moves simultaneously and forms the same letters and words in the same way. What you write in Chicago is instantly reproduced here in fac-simile. You may write it in any language, write in shorthand if you like, use code or cipher—no matter what, a fac-simile is produced here. If you wish to draw a picture, the same picture is reproduced here. An artist can by this device telegraph his pictures as a reporter telegraphs his description in words. The two pencils move synchronously, and there is no reason why a circuit of 500 miles cannot be worked as easily as one of 10 miles. It leaves a record at both ends and there can be no dispute about what is said. The writer's pencil is attached to two wires, which regulate the currents controlling the pencil at the other end. The invention will cost only about \$20, and is easily kept in order." Prof. Gray has also just completed an automatic switch-board for telephone exchanges, by which use of a telephone or telegraph he can put himself in communication with any other instrument. By this invention one person in an exchange can do the work of 30 or 40 under the present system, duties being merely to keep the automatic apparatus in order. The decision of the Supreme Court in the Bell case the other day does not interfere with Mr. Gray's claim to priority on the invention, and the professor's case will be pushed as fast as possible. He is backed by Lyman S. Sage of the Chicago bank and other substantial capitalists. The professor was not a party to the recent suit.

CASTING IRON IN A MAGNETIC FIELD.—A correspondent of the *American Machinist* says: "I would like to know if any reader of the *Machinist* has ever tried the experiment of making iron or steel castings by surrounding the flask with a powerful electro-magnet during the pouring process, or if it is known what effect would be produced upon molten iron or steel treated in this manner. If additional strength or improved polarity in dynamo castings can be obtained, it will amply pay for the experiment, which can be cheaply made in foundries where electric-light plants are in use. Will some one try it and publish the result?" The above inquiry is a very interesting one and the experiment should be made, especially since it can easily be done. The effect of the magnetic field upon certain liquids is well known. Solutions of various kinds, when exposed in the magnetic field, deposit crystals in a much shorter time and in a much more perfect manner than when otherwise exposed. It is more than

probable that molten iron or steel cooled—crystallized—in a magnetic field will take on some qualities quite different from iron or steel cooled in the ordinary way.

NATURAL SCULPTURE.—Though the Yellowstone Park is, so far as we know, the most remarkable geological and scenic region on the earth, there are other spots of very exceptional geological interest, notably Mount Rorosema in British Guiana. The summit of this mountain is a curiosity in aerial denudation. A traveler who has ascended that mountain says: "Our first impression was one of inability to grasp such surroundings; the next, that one was entering on some strange country of nightmares, for which an appropriate and wildly fantastic landscape had been formed, some dreadful stormy day, when in their midnight career, and broken, elastic clouds had their stiffened in a single instant into stone. For all around were rocks and pinnacles of rocks of seeming impossible fantastic forms, standing in apparently impossible ways, seeming to defy every law of gravity—in groups, singly in terraces, etc.—rocks as walls, as terraces, as pyramids, as caricatures of the faces of men and forms of animals, umbrellas, churches, etc. No tree or animal life was visible. Look where one would, on every side it was the same."

ANTI-FRICTION BEARINGS.—A recent invention of this kind, according to the *Boston Journal of Commerce*, is attracting considerable attention, the mechanism being designed for vertical shafts that revolve at a high rate of speed and are required to support considerable weight. Briefly, below a collar secured by set screws the shaft passes through a pillow block and terminates in a step which consists essentially of a hollow casting within which the shaft guiding socket fits; the socket is so formed that there is an annular oil-chamber above the socket, fed by proper oil ducts, and, about in line with the bottom of the shaft, there are two oil ducts leading from the chamber to the interior of the socket. The step simply acts as a guide for the lower end of the shaft, and not as a weight-supporting device, the weight of the shaft and its load being taken up by a series of anti-friction balls that rest within a groove formed on the upper side of the pillow-block, a corresponding groove being formed on the under side of the collar. The box to which the pillow is bolted is provided with three or more converging slots in which are adjustable blocks made of any of the anti-friction bearing metals.

CONVERTING COMPOUND INTO TRI-COMPOUND ENGINES is being steadily pursued by the directors of the Union Steamship Company of England. The R. M. S. Moor has just had her engines converted to the triple expansion system, making the fifth of the company's mail steamers which have been so dealt with. The Moor underwent her speed trial at Stokes Bay on the 15th of February, when she attained a mean speed of 16 knots per hour, and indicated 4532 horse-power. The engines worked at 70 revolutions per minute, with a pressure of steam in the boilers of 160 pounds per square inch. Compared with the Moor's performance on trial with compound engines, this shows an increase in speed of over three-quarters of a knot per hour, and an additional 232 indicated horse-power.—*Engineering*.

AN EMERY FILER.—An ingenious device for stretching emery cloth for use in the workshop consists of a couple of strips of wood about 14 inches long, hinged longitudinally, and of round, half-round, triangular or any other shape in cross section. On the inside faces of the wood strips are pointed studs, taking into holes on the opposite sides. The strip of emery cloth is laid on to one set in the studs, and the "file," as it is called, closed, which fixes the strips on one side. It is then similarly fixed on the other side, and thus constitutes what is called an "emery file," and which is a handy and convenient arrangement for workshop use.

It is not generally known that steel, when hardened, decreases in specific gravity, contracts in length and increases in diameter.—*The Engineer and Iron Trades Advertiser*. True, it is not generally known, and for the very good reason that it is not true, but that, on the contrary, no one can tell, beforehand, what effect hardening will have upon the dimensions of a piece of steel. Sometimes it will be longer and sometimes shorter—sometimes larger in diameter and sometimes smaller in diameter. Nothing is "generally known" about it, except that not much of anything is known.—*Am. Machinist*.

AN ANTI-BELT FRICTION PULLEY.—Belts conveying power are very apt to slip on pulleys, but a new pulley has been devised to prevent this. The pulley is covered with perforated sheet iron one-sixteenth of an inch thick, which is riveted to the pulley. The tension on the belt causes it to slightly grip the holes, and thus slipping is avoided, while at the same time the pulley is strengthened.

THE LARGEST BRASS CASTING that was ever molded in Pittsburgh was recently cast at the foundry of Mansfield & Co., in that city. It is what is called a "liner" for the inside of a large steel cylinder. In shape it resembles a thimble, and is put in the cylinder to give more strength to the steel. The weight of the casting is between 6000 and 7000 pounds.

## SCIENTIFIC PROGRESS.

## The Water of the Ocean.

The water of the ocean is generally of uniform saltness, but there are some localities which are saltier than others from some local cause, like masses of salt rock at the bottom, as in the Dead sea. The water of the Red sea, under the large evaporation from its surface, from the intense heat of the locality, and from the further fact that there are no large rivers flowing into it, is very salt and growing constantly saltier from year to year. In all probability it will in time become as salt or saltier than the Dead sea, or the Salt lake of our own country. Usually, a pint of sea water will yield an ounce of salt. It also contains a small quantity of sulphate of magnesium, sulphate and carbonate of lime, iodine and bromide of magnesium.

Sea water, inclosed in a bottle, is colorless. When looked at in a mass it seems a peculiar green; when viewed from a distance it is blue—"The deep, blue sea." In the tropics and some parts of the Mediterranean, along the Eastern shore, it is indigo blue. In other places it is a deep green; in still others, a slate gray. "Fickle as the sea" is true of its color, as of the changes on its surface. In some places the water is black; in others, white or beautifully transparent. In the fjords, off the coast of Norway, the water is marvelously clear and transparent. At the depth of 25 fathoms the smallest object can be seen on the sandy bottom. The water magnifies as the lenses of a microscope. According to one writer, the polar oceans are a very beautiful blue, while in the bay of Naples the rays of the sun, falling upon the water, cause it to sparkle as flakes of silver. The Black sea derives its name from the storms and tempests that sweep over it, while the White sea gets its name from great masses of floating ice.

The natural color of the sea is often modified, moreover, by the presence of animal and vegetable life. Hence it is that certain parts become, at times, milk white, while at other times and places the water is red as blood, as though the sea had ruptured an artery. This change in color is due to masses of seaweed, which float upon and near the surface. The Red sea often appears like a restless, tossing sea of blood, while a few years ago the Atlantic was covered with a dark purple mantle, which extended over many square miles. In ancient times this phenomenon was believed by nervous and superstitious persons to portend some awful calamity and visitation of the Divine anger and judgment. But science has solved the dark, portentous mystery, and quieted people's nerves by showing it to result from innocent and harmless causes. The black mud and yellow sand at the bottom of the ocean, as well as the color of the sky overhead, have very much to do with the appearance of the water. In some regions, as in the neighborhood of the West Indies, the water is so marvelously transparent that ships sailing over the surface appear to hang suspended in the air, and plants and animals are plainly seen on the bottom.

It is probable that the water has a color of its own, which is either blue or green. At night, and when roughened by wind or the passage of a vessel or dip of oars, the ocean sparkles and flashes as though on fire. In the Southern seas, sailors tell of halls of fire that roll over the waves, and of cones of fire, and of glittering serpents, chasing each other and wriggling and crawling with their fiery crests and flashing tails. All this illumination and glare is caused by the presence of phosphorescent animals that crowd by millions every drop of water and flit over the waves, lighting them up as with internal fire. Every drop of water is alive and seems to crawl and hum with these little flashing animalcules.

BALLOONING WITHOUT LOSS OF GAS.—There is much mysterious talk in military circles (says a Paris correspondent) of a balloon, the invention of a M. de Villars, in which the problem of aerial navigation is said to be solved, at least to a degree never yet reached. M. de Villars' aim has been to direct his balloon by taking advantage of the several air currents which are to be met with at various heights. To do this, it is necessary to ascend and descend frequently in the course of a voyage. But with balloons of ordinary construction this is impossible, by reason of the loss of gas and ballast which such maneuvers occasion. M. de Villars has no ballast to throw away, and he is able to retain the whole of his gas. Here lies the invention, which is kept profoundly secret. The inventor has, it is said, sold his secret to the French Government, to be used by it alone. Leaving out this part of the device, I may describe the balloon as consisting of a double envelope of calico, covered with a special varnish to afford greater security to the aeronaut and to render leakage of gas impossible. The additional weight thus occasioned is compensated by making the net of a new sort of fiber, which, while being twice as strong as hemp, is only half the weight. The car, which is attached in the usual manner, is described as cylindrical-conical, and is furnished with an electric motor driven by a dry battery. This motor will actuate a screw propeller, to be used only when it becomes necessary to temporarily direct the course of the balloon.

THE ELEMENT FLUORINE.—The three great things sought for by the ancient alchemists

were the philosopher's stone, the elixir of life, and the universal solvent. The last of these, though long known to modern chemistry, has just been separated, but cannot be retained simply because it attacks or destroys everything. It has sometimes been termed "the fury of the chemical world." It is, in fact, an element known as fluorine. A writer describes it as follows: It exists peacefully in company with calcium in fluor spar and also in a few other compounds, but when isolated, as it recently has been by M. Henri Moissan, is a rapid gas that nothing can resist. It combines with all the metals, explosively with some, or if they are already combined with some other non-metallic element, it tears them from it and takes them to itself. In uniting with sodium, potassium, calcium, magnesium and aluminium, the metals become heated even to redness by the fervor of its embraces. Iron filings, slightly warmed, burst into brilliant scintillations when exposed to it; manganese the same. Even the noble metals, which, even at a melting heat, resist the fascinations of oxygen, succumb to this chemical siren at moderate temperatures. Glass is devoured at once, and water ceases to be water by contact with this gas, which, combining with its hydrogen, at the same moment forms the acid, glass-dissolving hydrofluoric acid, and liberates ozone.

WIND MADE SOIL.—Water is not the only physical agent concerned in carrying the earth's solid materials from place to place, modern investigations proving that the dust carried by the wind produces astonishing changes in the configuration of the land. The thick deposits covering ancient ruins are now believed to have been largely brought by the air. A French geographer, M. Violet d'Aoust, after referring to Richthofen's description of a vast aerial soil formation in China, mentions having seen on the flanks of high mountains in Mexico clay strata not deposited by the waters nor by the decomposition of the rocks, but produced by the dust raised from the plains by the winds and left on the hills. These deposits vary from 100 to 300 feet in thickness, growing finer with increase in height, and ceasing at the limit of vegetation. The peninsula upon which San Francisco, with its hills and mountains, lies, was, no doubt, built up in this manner by the western winds which blow so heavily and so constantly inland from the ocean. The heavy surf which beats upon the coast throws up immense quantities of sand, which, as soon as dry, commence to travel inland before the wind. This movement can even now be watched all along the coast line between the city and the shore. The tops of hills from 20 to 50 feet or more high can be seen to be moving inland from year to year by the sand upon the western side blowing over the summits and resting upon their eastern slopes. Evidences of the action of the wind; in disintegrating the soft sandstone of the hills are to be seen in innumerable places on the "plains" on the eastern slope of the Rocky mountains.

HOW TO LIGHT A LAMP WITH A SNOWBALL AND THE LIKE.—When a small piece of potassium, the size of half a grain of corn, is dropped into a tumblerful of water, some of the oxygen of the water leaves its hydrogen, owing to the intense heat which the chemical action produces, and combines with the metallic potassium, causing a violet, bluish flame. When the piece of potassium is placed on the wick of a coal oil or alcohol lamp the flame produced by touching the potassium with a bit of snow, or ice or a drop of water, will inflame it. Fire under water can be produced by placing a small piece of phosphorus in a conically shaped glass filled with water, and some crystals of chlorate of potash covering the phosphorus, and then pouring through a long funnel, or a glass tube, a few drops of sulphuric acid down on the mixture at the bottom of the glass. Tongues of flame can be seen flashing up through the water. The intense chemical action produces sufficient heat to inflame the phosphorus under the water. Where there is sufficient heat and oxygen fire will burn, whether in air or water.

THE SITE OF AN ANCIENT EGYPTIAN LAKE.—The Government of Egypt has been persuaded to make surveys which prove the existence of a depressed region nearly 60 miles long by 20 miles wide, reaching a depth of 250 to 300 feet below high Nile. This depression has for several years been held by D. Cope Whitehouse to be the site of the wonderful artificial Lake Moeris, described by Herodotus—fictitiously, many have believed—with a circumference of 450 miles. The interest at last aroused in Egypt makes it probable that the Nile will soon be admitted to this valley by a canal 11 miles long. The creation or restoration of this great artificial lake will give fertility to a wide area and reduce the annual inundation of the Nile while storing water to replenish the river in dry seasons.

WASPS' NESTS.—It is a curious fact that wasps' nests sometimes take fire, as is supposed, by the chemical action of the wax upon the material of which the nest is composed. Undoubtedly many fires of unknown origin in haystacks and farm buildings may thus be accounted for.

WOMEN are gradually becoming active in scientific work. The Royal Geographical Society has decided to admit them to fellowship, and other prominent societies will shortly follow the example.

## USEFUL INFORMATION.

**INDIA RUBBER HORSESHOES.**—The proposed substitution of india rubber for metal in the manufacture of horseshoes is based upon various supposed advantages, one of these being that the former enables a horse to go easily over all kinds of roads and rough or slippery ground without slipping. The contrivance brought forward for this purpose is such as to obviate in one instance the necessity of using an iron shoe, and be moved momentarily when the horse is not traveling, and can also be used when the horse is shod with an iron shoe. According to this design the shoe consists of an india-rubber bottom piece molded to fit over or round the frog and the hoof, with a ledge or projecting rim rising up the front and around about level where the nails are clamped, the projection having an edging under which a steel band or other appliance can be drawn and nipped tight to retain the rubber shoe. The band is connected by studs, which pass through the heel part of the hoof, this being cut away from the inner side for the purpose, and the stud or studs may work eccentrically to obtain this grip or fixing. If the rubber shoe is used with an iron shoe, the frog portion or pad has a front plate and two side wings partially imbedded in it, the projecting taking under the iron shoe to fix the rubber shoe in place. If the rubber shoe be divided or made thin in the center, a swivel or other bar can be contracted from the rear to reduce the width of the pad so that it enters easily, and also expended so as to fix the rubber shoe in position.

**HOW THE AIR-BRAKE WORKS.**—Not one in a hundred, even of those who travel much on railroads, probably know how the pressure of air is used to apply the brakes to a train. When the air-brake was first invented the air was turned into the cylinder under each car when the car was to be stopped, and the pressure was exerted to force the brakes up against the wheels. But at the present day the brakes are held against the wheels by springs, and the air is turned into the cylinder to push the brakes away from the wheels as long as the train is in motion. When it is desired to stop the train the air is let out, and then the springs apply the brakes and stop the train. This last method of using air pressure has great advantage over the old way on the score of safety. Whenever an accident happens to a train one of the first effects it is apt to have is to rupture the air-pipes leading from the engine to the cylinders under the cars, and that of itself stops the train instantly. It is very important for everybody to understand this matter, because a child five years old can stop a train in 30 seconds from any car in the train if he simply understands how. You will see, if you look for it, that there is a sort of rope projecting from the toilet-room of every car. That connects with the air pipes under the train. If you catch hold of it and give it a little jerk it will stop the train before it has gone 200 yards.

**A FAIR IMITATION OF LEATHER** is being made from parchment paper, by which is understood a paper that has been rapidly run through strong sulphuric acid, then passed between rollers to get rid of as much of the acid in that way as possible; next through water to wash out as much acid as can be washed out of the remaining acid; and finally through ammonia water to neutralize the last remaining traces of the acid. In the latter processes the paper is handled by being run in a continuous roll. The grained appearance of leather is given to the acid-treated paper by passing it, while damp, between rollers, one of which has the indentations required in its surface. The designs for the latter are obtained by the electrolytic process from a real skin. Having been indented so as to closely resemble leather, the parchment paper is stained or dyed any desired color; then, like the leather which it closely imitates, it may be glued, gilded, pressed or stamped. It is used advantageously as a substitute for leather in the binding of books, as it possesses no small degree of strength and stands wear remarkably well.

**CORRECTING DARK SHADES IN DYEING.**—Manufacturers will complain and ask how it is that when a certain shade has been got with a given weight of dyestuff upon a given weight of wool the same weights cannot be got to give the same shade at another time. "I have had," says the practical man, "many a talk with people who have no idea of the difficulties of dyeing, and it is hard to make them understand that with the same quantity of wool and the same amount of mordant and dye there will be, or there can be, differences of shade. It is well known that such a thing happens every day in the dyehouses. A coarse quality of wool, for example, requires only two-thirds of the materials required by a finer sort of wool. The best and easiest way for the dyer when he is uncertain is to take care not to use too much dyestuff, in the first instance, for at least it is possible to make the shade darker by addition of logwood, peachwood or fustic; but if the shade comes up too dark it is no easy job to make it lighter."

**INCANDESCENT LAMP GLOBES.**—The common practice of surrounding incandescent lamps with opal globes, or globes of ground glass, leads to a loss in the one case of from 40 to 60

per cent of the light, and in the other of from 25 to 35 per cent. A simple method by which the character of the light can be softened without experiencing so great a loss of intensity has recently been proposed, and consists in covering the globe of the lamp with a film of ordinary collodion, which can, by adding successive films, be made of any desired thickness. The reduction of the light of the lamp does not, it is said, with this method exceed ten per cent, and the system possesses the further advantage that the film can at any time be removed by simple friction.

**ANNEALING STEEL.**—For small pieces of steel, take a piece of gas pipe two or three inches in diameter and put the piece in it, first heating one end of the pipe and drawing it together, leaving the other end open to look into. When the piece is of a cherry red, cover the fire with sawdust; use a charcoal fire and leave the steel in over night.

**TO HARDEN COPPER.**—Melt together and stir until thoroughly incorporated copper and from one to six per cent of manganese oxides. The other ingredients for bronze and other alloys may then be added. The copper becomes homogeneous, harder and tougher.

**TESTING RAILWAY TIRES.**—In a machine for testing steel railway tires, in use in France, a succession of blows, similar to those delivered by means of a sledge-hammer, are given to the tires, in place on their wheel centers and revolved on rollers.

**SHEET-STEEL** is now copper-plated on both sides by electro deposition and used as sheet-copper. The sheet is decarbonized steel, and one of the copper sides is tinned. The new material is manufactured at Pittsburg, Penn.

**"STRAP" OR BELT.**—In the nomenclature of mechanics nothing strikes an American mechanic as being more odd than the English use of the word "strap" for what we call a belt.

## GOOD HEALTH.

## The Nervous American Temperament.

We are emphatically a people of nerves. Visitors from other lands are astonished at the fierce activity that pervades our most insignificant actions; but they themselves speedily contract restlessness and no longer marvel at wonderful developments of invention and speed of practical application. A portion of this great energy is doubtless due to American climate, which teaches in a vigorous and obtrusive manner that quiet and rest do not form part of nature's law in this country, but it is far more a result of our newness, our youth in the family of nations. Scarcely out of the swaddling clothes of history, we are called upon to stand up squarely in competition with a thousand years of past, and show the old fogies a new thing or two. And we have done it, are doing it now and apparently have shouldered a contract to keep in the lead for all time to come. What with new instruments of annihilation of time and distance, limited express trains across the Continent and unlimited chances for express speed in dissipation, the American temperament has already grown to be one great delicacy of nerve. Our children, at an age when their contemporaries in other lands are still at school, relegate the "old folk" to the rear; the father's opinion is voted as "good, of course, but belongs to the past period." Yet, in all this mad speed there is reason. It does not follow that we live shorter lives than elsewhere, even in length of years; that is not the case. We are not less capable of keen appreciation of good things, when once they are introduced to us; on the contrary, we are apt to see beauty and say so, too, when not even a glance of pleasure shows that our slower neighbor has noticed it. But from a medical point of view our temperament is a dangerous one to the State, in that it does most distinctly repress reproduction. The future American will be conglomerate; the blood of our forefathers will be so far diluted that its characteristic will be lost in foreign overflowing tide, which, if sluggish in its flow, may still be of service by reclaiming from too much nervousness our fidgety people.—*American Magazine.*

## Stooping Forward.

We clip the following from the London *Lancet*: Every one knows that stooping forward partially after rising quickly from bed in the morning, when the stomach is empty and the heart has less than ordinary support from the viscera below the diaphragm, is very apt to occasion a form of faintness with vertigo not unlike that which occurs in seasickness. The peculiar forms of headache distinctly caused in this way when the head is long leaned forward on the chest, bending the neck on itself, cannot fail to occur to every one; nor will the high tension of the eyeballs, the turgid and heavy eyelids, the snuffing nose, the deafness with buzzing or throbbing in the ears, the heavy breathing, and the puffed and perhaps flushed or darkened color of the face, resulting from the obstructed venous circulation through the bended neck, be forgotten. There are other and

more perilous, though secondary, effects of bending forward when the heart is weak, or the blood-vessels are not so strong as they ought to be, which should not be overlooked.

The weakly, and those who are not unlikely to have hearts readily overburdened, and blood-vessels easily stretched beyond recovery, or even ruptured, should be warned quite as earnestly against suddenly assuming or too long retaining postures which do—however slightly or partially—impede the return of blood through the veins. Probably few postures commonly taken up by the persons who lead somewhat sedentary lives are so prone to do mischief unnoticed as that of "leaning forward" when at work at a table which is not sufficiently high to insure the head being raised so that the veins of the neck may not be in any way compressed, or the return of the blood from the head embarrassed or delayed. We see reason to believe that if this apparently small matter were more generally understood there would be fewer head and heart troubles, and we will go so far as to say that some lives now lost would be saved.

**SIMPLE REMEDIES.**—When stung by a bee or wasp, make a paste of common earth and water, put on the place at once and cover with a cloth. For a cold on the chest a flannel rag wrung out in boiling water and sprinkled with turpentine laid on the chest gives the greatest relief. When a felon first begins to make its appearance, take a lemon, cut off one end, put the finger in, and the longer it is kept there the better. For a cough, boil one ounce of flaxseed in a pint of water, strain and add a little honey, one ounce of rock candy and the juice of three lemons; mix and boil well. Drink as hot as possible. Often after cooking a meal a person will feel tired and have no appetite. For this, beat a raw egg until light, stir in a little milk and sugar and season with nutmeg. Drink half an hour before eating. For a burn or scald, make a paste of common baking soda and water; apply at once and cover with a linen cloth. When the skin is broken, apply the white of an egg with a feather; this gives instant relief, as it keeps the air from the flesh. At the first signs of a runround take a cup of wood ashes, put in a pan with a quart of cold water, put the pan on the stove, put your finger in the pan, keep it there until the water begins to boil, or as long as it can be borne; repeat once or twice if necessary.

**SLEEP A MECHANICAL OPERATION.**—A writer on the philosophy of sleep declares that sleep is prevented by an excess of blood in the brain, and proposes as a remedy to pump the blood back from the brain by a peculiar mode of breathing for which directions are given as follows: Having assumed the usual posture for repose, the person is to inhale and exhale slowly and steadily in long breathes, devoting the whole attention to making the inhalations and exhalations exactly the same length, the length to be much greater than that of ordinary breathing, though not sufficient to disturb the circulation by working the lungs to their full capacity. In support of this theory reference is made to the feeling of faintness by filling the lungs with all the air they will hold, and then expelling it, repeating the operation rapidly three or four times; the resulting faintness is attributed to the withdrawal of blood from the brain, and the same effect substantially follows any sudden and extreme emotion. So violent a disturbance of the system, however, is not advised for the purpose here sought, but a steady and gradual diversion of the blood from the brain to the lungs and body.

**THE DOCTOR IN THE FAMILY.**—Dr. H. C. Sawyer, in his late book on nervous impairments, says of the doctor: The doctor should come and go like the clergyman and the priest, instead of being a necessary evil, whose visits are avoided as long as possible, and which are a source of uneasiness when necessarily multiplied. He should be a minister and guardian of health, an officer of the family, upon whose special wisdom free, early and constant reliance is placed. The eradication of inherited tendencies to disease, the direct improvement of the physical and mental measure of stocks, the development of a hardy constitution in weak children, the recognition and arrest of many fatal organic diseases in their incipency, before they are too old to be controlled, the arrest of acute inflammations, at a time when this is possible, the insuring of longevity and a sound old age—these are some of the things which the physician of to-day is able, but which he is not often permitted to do.

**TREATMENT OF SCIATICA.**—Some time ago M. Debove announced that he had been able to afford marked relief in a case of obstinate sciatica by means of a spray of chloride of methyl applied along the course of the sciatic nerve in the unaffected member. At a recent meeting of the Societe de Biologie, M. Raymond reported that he had obtained favorable results by a similar method in three cases. He found, however, that the effect was the same even when the spray was directed to any part of the limb, and not necessarily along the course of the sciatic nerve. This would seem to prove that the relief of the pain was due to an impression made upon the spinal center by refrigeration of the peripheral nerve terminations, rather than to a direct influence exerted upon the trunk of the affected nerve itself or of its fellow in the opposite limb.

## Steam Boilers.

## Amendments to the Regulations of the Supervising Inspectors.

Several changes have been made by the Board of Supervising Inspectors of Steam Vessels in the rules governing the construction of boilers. The sections amended are as follows:

**SECTION 6.** No braces or stays hereafter employed in the construction of boilers shall be allowed a greater strain than six thousand (6000) pounds per square inches of section, and no screw stay-bolt shall be allowed to be used in the construction of marine boilers in which salt water is used to generate steam, unless said screw stay-bolt is protected by a socket. But such screw stay-bolts without socket may be used in staying the fire-boxes and furnaces of such boiler, and not elsewhere, when fresh water is used for generating steam in said boilers, and no brace or stay-bolt used in a marine boiler will be allowed to be placed more than 8½ inches from center to center. In allowing the strain on a screw stay-bolt, the diameter of the same shall be determined by the diameter at the bottom of the thread.

**Sec. 9.** Third example, paragraph 3 and 4.

Paragraph 3. Lap-welded flues used in boilers carrying 100 pounds of steam or less, any flue over 10 feet, and not over 15 feet in length, shall have two wrought iron rings attached to the flue externally, equidistant between the ends of the flue, and there shall be attached one additional ring for every five feet, or fraction thereof, over 15 feet in length.

Paragraph 4. All such rings shall be good and substantially made, and properly and securely attached to the flue, and shall have a thickness of material of not less than the thickness of the material of the flue, and a width of not less than 2½ inches. Lap-welded flues used in boilers carrying over 100 pounds of steam, shall have rings attached, as called for above, of not less than one and one-half (1½) the thickness of the material of the flue, and a width of not less than three (3) inches. Provided, however, where such flues are made in lengths of not over five feet, and fitted one into the other, and substantially riveted, the wrought-iron rings may be dispensed with.

**Sec. 12.** The feed-water shall not be admitted into any boiler, used in connection with a condensing engine, at a temperature less than 100° Fahrenheit, and any boiler used in connection with a non-condensing engine, at less than 180°. And no marine boilers shall be used without having proper auxiliary appliances for supplying said boiler with water, in addition to the usual mode employed.

**A GIANTIC LOAD OF LUMBER.**—The *Northwestern Lumberman*, of recent date, said: When it was announced in the *Lumberman* that the barge Wahnapitac had carried a cargo of 2,181,000 feet of lumber, letters were received asking if it was not a typographical error. It was thought by many that no boat could carry such a load. For the purpose of showing the barge on paper, a photograph was obtained of her when loaded at Duluth. The freight rate to Tonawanda was \$3.75 a thousand, which footed up to a total of \$8178.75. The owners of the boat, however, were not satisfied with such a record, and proceeded to break it by loading at Duluth 2,409,800 feet of lumber, which also went to Tonawanda, and which is put down as the biggest cargo of lumber on record. At the latter place the cargo was unloaded on Saturday afternoon and Monday forenoon—one working day. It will be readily understood that the money-making capacity of the barge is of the Jumbo order also. The barge is owned by the Saginaw Lumber & Salt Company and the Emery Lumber Company, and cost \$30,000. She is 275 feet long and 51 feet beam. The lumber on her was piled 22 feet high and she drew 11 feet of water. Had she been 10 inches wider, she could not have passed through the Soo canal. The boat was built on the Saginaw river a year ago last winter, and was designed for carrying logs from the Georgian bay to the Saginaw river and Tawas mills. The Canadian Government, however, increased the export duty on logs, and the barge was put into the lumber carrying trade.

**NEW HOPE FOR CONSUMPTIVES.**—Each year brings new hopes for consumptive patients, and some eminent men think that the discovery of a remedy for this too common disease is now but a matter of time. Garcin has found that inhalation of air containing a small amount of hydrofluoric acid gas has a remarkably good effect on consumptives. Of a hundred cases so treated, 41 per cent improved and 38 per cent were cured. Hydrofluoric acid kills the bacilli of disease, and as phthisis is caused by the presence of these lower germs of life in the lungs, their destruction removes the cause of the disease. Hence, if the patient is not too far gone, it is reasonable to expect an improvement.

**SINCE** redwood has come into use for making furniture it has advanced greatly. A few years ago the kind used for furniture could be bought for \$10 a thousand, and now it is \$90 to \$100. The burl or knob which appears like excrescences on the trunk are worth \$250 per thousand.

The Granite Mountain Mining Company of Montana paid a dividend of \$200,000 on the 9th, making \$600,000 this year and \$4,200,000 to date.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

KENNEDY.—Amador Dispatch, March 20: All the necessary arrangements for sinking the main shaft of the Kennedy mine a few hundred feet deeper, such as cleaning out the sump, making and preparing water tanks, etc., have been about completed, and the process of sinking will at once be vigorously pushed forward.

NOTES.—Amador Ledger, March 24: On Monday Sheriff Adams sold on the ground at Quartz Mountain the personal property belonging to the Gold Mountain Overplus mine, consisting of ten-stamp mill and other mining machinery. The property was sold to T. H. Goodman, owner of the real estate, for the sum of \$250, about sufficient to cover the amount of judgments and costs. It is reported that this litigation being settled, the mine will again be started.

SOUTH SPRING HILL.—We are informed that a shaft in the machinery at this mine broke Wednesday, bringing underground works to a standstill until the same can be repaired, which will be no doubt in a few days.

## Butte.

MAGALIA RIDGE.—Cor. Oroville Register, March 22: The owners of the Aurora mine have put on a force of men this week. They have been getting the tunnel in shape for some time past to work the mine to better advantage than it has hitherto been worked. The owners of the Pershbaker or Magalia mine expect to reach the face this week. They have been at work draining the tunnel for the past three or four months at a cost of between \$6000 and \$8000 and now are just about ready to begin taking out gold. A new company has been organized to work the Meredith ledge in the vicinity of Lovelock. A new mine has been located by Messrs. Kitchen, Church and others, east of the Calamity mine in the neighborhood of Magalia. Saulsbury & Callahan, who had the Brandt ledge bonded, have rich prospects and are now sinking on the ledge. Some of the rock they are taking out would run as high as \$10,000 a ton. Another prospect struck about half a mile from the above by Henry Riffe shows thread gold as far down as they have sunk on the rock. The Alki mine, about 2½ miles from Magalia, is being pumped out and a force of men will at once be put to work. Of this mine Mr. George Perry is the principal owner and superintendent. The Calamity mine will start up in a few days. The prospects are good in this mine. Work has commenced in the Orofino mine near Nimsbaw. In the vicinity of Toadtown, Sol Petit has struck a fine prospect in quartz, while Wash Henderson has discovered a fine prospect near the Saulsbury property.

## Calaveras.

TO BUILD A MILL.—Angels Record, March 20: The Matson mine, adjoining the Gold Cliff, was sold last week to Messrs. A. J. Lane & Co. of Knight's Ferry, who intend to build a ten-stamp mill in the near future. A competent millman will have charge of the property. There can be no doubt that the mine is all that has been claimed for it.

## El Dorado.

HENRY'S DIGGINGS.—Cor. Placerville Democrat, March 24: Since my last letter I have been looking over the mining camps in this part of El Dorado county, both gravel and quartz, and find them looking well. All the mines in this locality are at work, and all seem to feel well. The Parker Bros. will soon have a 10-stamp mill running. Wm. Griff and Lefe Missamore are mining on the trail leading from this place to Grizzly Flat, and are getting much gold. Wiley Sexton & Co. are taking out some fine-looking gravel at Dogtown. Wiley also has a claim near Grizzly Flat. I understand the El Dorado Quartz Mining Co., near this place, have shut down the mine and mill for repairs. S. P. Poskin of Grizzly Flat, and John McDain of Henry's Diggings, have some fine-looking gold-bearing quartz in their tunnel. Good gravel is being taken out of the Carrie Hale mine, and the Bradley ditch is full of water.

VIRGINIA.—Placerville Observer, March 20: At the Virginia mine on Poverty Point, a tunnel has been run on the vein 100 feet. The ledge averages about 4 feet wide of free-milling ore that prospects from \$12 to \$15 per ton. This ledge is well defined between two smooth walls, soft and easily mined, seldom requiring powder. The outlook of this mine is decidedly encouraging to the owner.

CHURCH.—Hon. J. H. Neff of Placer county, ex-Governor Perkins and others, own the Church mine near El Dorado. They have a shaft down 260 feet showing a ledge 12 feet wide of ore, which pays in free gold over \$18 per ton. The ore chute seems to increase gradually in width from the top down. Six miners take out sufficient ore to keep their ten-stamp mill running day and night. That the Church is one of the best bullion-producers in the county is an established fact. The company are now preparing to lay a line of pipe 2000 feet in length, from the Park canal to their mill and hoisting works, so as to run their entire machinery by water-power.

EQUATOR.—The Equator mine, about 2600 feet north of the Church mine, near El Dorado, is running a tunnel to crosscut the same ledge several hundred feet deep, and from surface indications and other surroundings it is scarcely to be doubted that the company will open up a mine perhaps equal to the Springfield and Church at the same depth.

TRUE.—The True Co., north of Placerville, tapped the same ledge with their 1300-foot tunnel, which they have been running for a long time, and, though they have not got through the ledge so as to establish its entire width, the outlook is exceedingly gratifying to the owners.

BIG TUNNEL.—Still further north the Big Tunnel Co. are driving ahead as rapidly as possible, and must in time crosscut this same ledge at a great depth from the surface, which will give them important advantages for economical working.

CONFIDENCE.—The Confidence Placer Mining Co. at the head of Cedar, are running two tunnels from the bottom of their incline, one east and the other south. The east drift is in 200 feet, in 2½

feet of gravel, the south drift being in 50 feet in 4 feet of very fine pay gravel. In running these drain levels, they take more than enough gold out to pay all expenses.

## Lake.

QUICKSILVER.—Lower Lake Bulletin, March 24: Under the efficient superintendency of Capt. White, new and valuable developments have been made at Sulphur Bank Q. M.

## Mariposa.

MARIPOSA GRANT.—Gazette, March 24: We have nothing new to state authoritatively in regard to the movements of the Mariposa Commercial and Mining Co., owners of the Mariposa Grant. What they intend to do will be best known when they get into the field and commence active operations. There seems to be a general opinion among the settlers and those waiting for work that no extensive work will be done in the mines this season. A water ditch or canal is, no doubt, the first thing to be considered. With water-power a great deal can be accomplished for private as well as public good.

## Monterey.

BURRO DISTRICT.—Cor. San Luis Obispo Tribune, March 24: The Burro mining district is coming to the front as never before and this time is likely to stay. The Cruikshank mill is crushing a ton and a half of ore per day, and claims to be grinding out \$500 per day. The Manchester is in luck; also the Ajax, which has capital to develop; this also claims great things. The Eureka and other lesser lights are showing up to good advantage, so that there may be said to be a live boom on hand. These mines it is known belong to resident citizens and will doubtless prove a benefit to the State at large.

## Nevada.

THE PITTSBURG MINE.—Transcript, March 24: It is announced that the Pittsburg Mining Co. are about to commence working their mine in this district on a more extensive scale than they have for some time past. The Pittsburg has produced a great deal of gold in years gone by, and is believed to yet contain much. One thing and another has, however, interrupted its operation of late, but now that it is provided with efficient machinery, good arrangements for drainage, etc., it is quite likely there will be no further obstacles to the working of the claim.

OMAHA MINE.—Grass Valley Union, March 25: The water in the Omaha mine has all been pumped out for some days, the lowest level drained being No. 9. A 10-inch pump is being put in down to that level from No. 4 level, and above No. 4 to the surface a 12-inch pump is used. These pumps will be sufficient to control all the water in the Omaha and Lone Jack. The depth of the Lone Jack shaft is not definitely known (so many years having passed since work was done upon it), but from the best information obtainable it is about 500 feet. The mine has good ore in it, and the record of its yield during its former productive period has been written at \$500,000. By consolidating the Omaha and Lone Jack the owners have done a very sensible thing.

THE PENNSYLVANIA.—Tidings, March 26: The rich rock reported from this mine of late has been taken from the second level north, while in the meantime level No. 3 north has been driven ahead. Yesterday the vein was encountered in this lower level and it varies from 18 to 26 inches in thickness. Although none of the ledge here has been taken up, pieces chipped from it show gold and other mineral freely. An assessment of 1½ cents per share of capital stock has been rescinded, recent developments and this last strike justifying such procedure. There are 40 or 50 tons of ore on the dump, and hauling to the mill will commence this week. Capt. Hamill & Co., lessees of the mine, say they would not take \$5000 for this batch of rock.

WASHINGTON TOWNSHIP.—Cor. Nevada Transcript, March 25: Times are looking favorable in this district. The mines are all doing well, the Blue Bell showing up nicely. The Yuba mine is running in full blast and looking better than ever. The Daylight will soon be in running order. The Washington at Ormonde is running at full blast. The Rough and Ready gravel mine near Washington, shut down last Tuesday on account of a reduction in wages. The owners are fearful lest the hoisting works will be blown up with dynamite. Mr. Nixon's mine on Brandy Flat is looking well. The California, on Gaston ridge, is under headway. It is rumored that the Gambrian mine will start by the first of the month. The Baltic tunnel is said to be nearly to the ledge. The Cary mine will start by the first of April.

## Placer.

MAY FLOWER.—Placer Republican, March 21: The May Flower tunnel, a mile long, the incline, and the upraise have all been completed, and the miners broke through into the long-sought blue gravel last Friday. Blue gravel of the same character as that in the old works above was found. The point at which they have cut through the bedrock into the channel is somewhat high on the rim, but it will be the work of only a few days to push the tunnel ahead and cut the bedrock lower down. The survey and the work have proved to be a success. There is a large force of men at work and the mill and mine will soon be in operation. At the Live Oak they have just found the north rim of the new channel, and have ascertained that the channel is about 200 feet wide with 7 feet of gravel. They will begin breasting this week and wash the gravel which does not need crushing. The gravel from a new drift running easterly must be run through the mill. Everything appears to be booming at the Forest Hill mines.

## San Joaquin.

INDICATIONS OF OIL IN LODI.—Stockton Independent, March 26: One day last week while a force of men were boring for water on Miner Burge's lot in Lodi they struck a flow of water containing abundant indications of oil. These indications were found at a depth of 95 feet, after passing through fine strata of bardpan.

## Sheets.

IGO.—Cor. Shasta Courier, March 24: There has been some stir in mining circles of late. The Shane Bros., of Sonoma, have had placed at the Continental mine at South Fork one of their concentrators, which works well and gives satisfaction to the owners thereof. Eogle & Godfrey have been taking ore from the Dayton mine getting it concentrated here and shipping the concentrations be-

low. Robinson & Son are taking out ore from the Bullion mine. The Hardscrabble mine has just cleaned up, with satisfactory results.

FRENCH GULCH.—Cor. Redding Free Press, March 24: Geo. Kline has been over to French Gulch to look at Frank Wheeler's new discovery, and pronounces it the richest in Shasta county. There is ore enough in sight to run their new five-stamp mill for five years. The vein can be traced on the surface for 600 feet, at an average width of four feet, and it is free of sulphurets. It is high-grade ore. What astonished him most was how anything so rich could have lain hid so long. Steps are cut in the hill for a mile to reach it, as it was almost inaccessible without them. L. Gross, a mining agent, has purchased several claims on Squaw creek, and busy times may be expected soon.

## Trinity.

THE HARDCRABBLE.—Trinity Journal, March 24: Mr. W. R. Bigelow has sold to A. J. Wallace his one-fourth interest in the Hardscrabble mine at East Fork. The mine is looking very well and the company have let a contract to sink an inclined shaft 30 feet, following the ledge; this will bring them to a depth of 100 feet, and it is probable that the mine will be much increased in value by the completion of this work.

## Tulare.

NEW COMPANY.—Visalia Delta, March 22: The Mill Creek Mining and Milling Co. has been incorporated, with principal business place at Visalia. The gentlemen's names appended to the articles of incorporation are A. E. Hall, J. E. Denney and W. W. Stouland of Visalia, and Phares W. Rider of Dunlap, Fresno county. The present base of operations is confined to Mill creek, at a point about 30 miles north of Visalia. Prospecting has been carried on here for about a year, with very encouraging results. A tunnel has been run 100 feet, and ore taken which assays from \$35 to \$75 per ton. The company will erect a 5 or 10-stamp mill within a very short time, and thenceforth make vigorous efforts to develop the mine, which is believed to be very rich.

## Tuolumne.

MOFFITT'S BRIDGE.—Union Democrat, March 24: The marvelous yields of Mr. Moffitt's river claim last fall are yet fresh in the minds of Tuolumne people, and meeting Mr. J. R. Moffitt in Sonora this week we learned that he is now making extensive and systematic arrangements for the early and prolonged prosecution of the enterprise. His army of men will force the work with expedition and experience, and next summer and fall prodigious results will be obtained.

CHLORINATION WORKS.—Union Democrat, March 24: The mining and milling community of this county has for a long time desired the erection and conduct of chlorination works, and in the absence thereof large quantities of ore have been shipped to San Francisco to the various metallurgical works, thereby creating considerable expense. In the near future, however, the miners of this and adjoining counties can have their ores treated thoroughly and scientifically by the most modern and approved system of chlorination. Mr. P. J. Sullivan, of the Buchanan company, is now in Sonora, and in an interview with him we learned that he is making expeditious and strenuous efforts to have chlorination works erected at the Buchanan mine and in operation within at least 60 days. The works will have a capacity of four tons per day, and besides desulphurizing the concentrations of the Buchanan mine, the works are intended also for custom service. All of the appointments of the institution will be of the best.

NOTES.—Union Democrat, March 23: The McPherson mine, not far from Columbia and next to the Stanislaus river, is, we learn, doing well. Tommy Gibbons hauled four miners up to the Clark mine this week. Both the mill and mine are in operation. We learn that the Hyde mine is widening out and is looking well; it averages in width about 10 feet. Mr. C. J. Garland, a mining gentleman of much experience and ability, is superintending the Oneste mine at Groveland. Tuttle town is coming to the front. Within less than 500 yards of each other, three quartz-mills are in constant operation. It is rumored that a good-sized pocket was taken out this week at or near Tuttle town, but thus far it has not been verified. The Oakland mill, situated on the Yankee hill ridge, not far from Nate Arnold's mine, is, we understand, about to be started on rock from the mine of the same name. The parties having the enterprise in hand are Messrs. Bryant, Booth and Hastings. Mr. Miller of the Kincaid gravel mine came up from Stockton this week. It is expected that the mine will make a fine record for itself this summer and fall. Every facility for working is now brought into requisition, and the weather no longer impedes operations. Messrs. Paul Morf and Eugene Abbott are the owners of the Great Western mine, and from some prospects which we have seen the rock will certainly pay well. The mine is about 12 miles east of Sonora and not far from the Evans mines. It is reported that a mill will be erected on the Dead Horse mine, near Summer-ville, in a short time. From all the evidences thus far, this is a valuable property and much is expected from it. The Lady Washington mine, on the same lode, and owned by Mrs. Dorsey of Sonora, is also a fine property. It is learned on good authority that the Black Oak mine near Soulsburyville is developing into a splendid property, and thus from present indications both as to the value and quantity of the ore, the mine will rival and probably surpass the famous Soulsby mine, which years ago yielded millions of dollars. The lode at present is eight feet in width and will pay \$40 per ton.

GOLD.—Tuolumne Independent, March 24: Messrs. Engstrom and Hastings, lessees of the claim of McKenna, Hastings & Hale, near Columbia, are still taking out gold. One day last week they opened a little watch-pocket containing \$270.

## NEVADA.

## Washoe District.

BULLION.—Virginia Enterprise, March 24: Are still at work on the station over the winze on the 500 level to put a steam hoist at that point. The plant is expected here daily.

CONFIDENCE AND CHALLENGE.—The Challenge mine occupies 50 feet of ground north of the Confidence and 40 feet south of it. Ore was struck a

few weeks ago in a drift in Confidence from the 1100 of Yellow Jacket. But very little information has hitherto been published regarding the work done to develop it. The following description is the best information attainable by this reporter regarding it: An upraise incline at an angle of about 35 degrees was started near the north lode of Confidence and run south toward the Jacket, and a drift from the Jacket 1000 level was started north toward the south line of Challenge to meet it. This upraise has been continued until it is now in the neighborhood of the Challenge and has a distance of about 150 feet. It has run in ore all the way. This ore is understood to be above the milling grade. The ore body narrows and enlarges at different places, but gets stronger as the Challenge south ground is approached. It will undoubtedly be found in this 40 feet of ground stronger than at any other point, and will also be found in the Jacket on the 1000 level where the north drift is making. In the north portion of the Challenge ground a winze was sunk from the 1100 some distance north of the place where the Confidence incline upraise starts for the south on the 1100, and the bottom is in good ore. The above figures then show an ore body which can scarcely be less than 300 feet long, and to which is given an average width of 25 or 30 feet. Are shipping about 120 tons of above average grade milling ore from the Confidence to the Brunswick mill per day.

SAVAGE.—On the 400 level the south drift has been advanced 24 feet. In the north drift we are putting in sill sets preparatory to extracting ore. On the 500 level we are opening a new working station from the shaft, which will be completed this week. We are extracting ore from the several levels between the 400 and 900 stations. Through the want of milling facilities we have not been able to make our usual shipments. We are now shipping and having reduced at the Rock Point mill, Carson river, about 60 tons per day, and expect to have milling capacity for double that quantity very soon.

GOULD AND CURRY.—On the 250 and 300 levels have extracted during the week 75 tons of fair-grade milling ore, which has been stored in the drifts in the mine. On the drain tunnel the main south drift has been advanced 102 feet. West crosscut No. 1 from the main south drift has been extended 31 feet; total length, 90 feet. It is passing through low-grade ore. West crosscut No. 2 has been extended 22 feet; total length, 70 feet. It has been connected with the south slope from the 250 level and is in low-grade ore.

CROWN POINT.—The 400 level winze started last week was down 41 feet yesterday morning in ore of good grade all the way, and the ore at the bottom is of the same character. At a distance of 40 feet down the winze the west casing or west lay was struck. It is pitching southeast 50 degrees, and the course is southwest and northeast. Are still following on this wall in ore.

HALE AND NORCROSS.—From the south drift, 400 level, we are stopping ore of good quality. On the 700 level all the slopes are looking well. From these two levels we are extracting and shipping to the Mexican and Nevada mills 200 tons per day. The battery samples average \$38 per ton. We have bullion on hand and previously shipped for this month amounting to \$75,000.

BEST AND BELCHER.—East crosscut No. 4 from the main north lateral drift has been extended 30 feet; total, 75. The formation is quartz, showing low assay value. The upraise has been carried up 20 feet; total high above track floor, 120 feet. From the top of this upraise a north drift has been advanced 34 feet. This drift is wholly in quartz, showing value by assay.

BALTIMORE.—Are cutting into the vein at two different points, one in the north drift and another in the northwest drift. Both are in ore. Water was struck at both points, but they have managed to keep it back. Drill holes have been sent from the northwest drift and it is taking the water of both drifts.

BELCHER.—The east crosscut on the 500 level is now in 170 feet. The ground shows no change. The west crosscut has been advanced 12 feet; total, 72 feet. Have resumed work on the south lateral drift, which was advanced 8 feet. The face is in favorable-looking vein material.

ANDES.—The drift on the 350 level, which has been running east, has been turned northerly. The face is in good ore, and the prospect is flattering. It is expected to connect this drift with another at that point. On the 240 level are drifting north in a favorable formation.

IOWA.—The McBee tunnel has been repaired and the track laid 15 feet. Advanced face of same 6 feet; total, 800. The face is looking well, with quartz seams coming in. The Chandler cut was advanced 8 feet, showing good quartz.

OCCIDENTAL.—In the lower tunnel, 150 feet south of the north incline winze, the south drift has been extended 7 feet; total, 38. Have extracted 30 tons of fair-grade milling ore.

CHOLLAR.—The south drift from below the Hale & Norcross 400 level is in 160 feet in Chollar ground. It lacks 160 feet of connecting with the Chollar 600 level drift.

UTAH.—On the 472 level the incline upraise from the end of east crosscut No. 3 has been carried up 40 feet; total high on the upraise, 88 feet.

YELLOW JACKET.—Are shipping 100 tons of gold-bearing ore daily to the Santiago mill, which has been properly repaired.

JUSTICE.—Work has been temporarily discontinued in this mine. There are about 1700 tons of milling ore on the dump.

ALTA.—Are upraising in Lady Washington and sinking on the Keystone vein to meet the upraise from the 725 level.

SCORPION.—On the 300 level the north drift is advanced 152 feet and the south drift 133 feet.

POTOSI.—The west drift (Belvidere) is in 85 feet. This drift is showing fine-looking quartz.

## Aurora District.

ANTELOPE MINE.—Esmeralda News, March 20: Since the return of Hon. H. Marden to Aurora, a contract has been let to drive the Porter tunnel 200 feet under the old workings of the Antelope mine. The work has been commenced and will be prosecuted expeditiously. When it is in it is supposed that the tunnel will tap the ledge at a greater depth,

and an increase of miners will be put to work running levels on the vein and extracting ore to be worked at the Silver Hill mill, which has been consolidated with the Antelope property. The prospect is therefore good for Aurora.

**Eureka District.**

**ORE.**—Eureka *Sentinel*, March 24: The Richmond Company received 14 tons of custom ore this week, viz.: From the Jackson mine, seven tons; Barton, six tons, and White Pine, one ton. There will not be much increase in the purchase of side ores at our furnaces until the roads are in condition for hauling.

**DIVIDENDS.**—The Eureka Con. Mining Co. declared another dividend last Tuesday of 25 cents per share, amounting to \$12,500. The total amount of dividends paid by this company, this one included, amounts to \$4,803,500. It is probable that the Richmond reduction works will resume operations on the 1st of April. The tributaries in the Eureka tunnel have out, ready to ship, between 40 and 50 tons of ore.

**Frieberg District.**

**SMELTERS WANTED.**—Eureka *Sentinel*, March 24: John Ernest has been working lately on a mine in the Frieberg district, owned by George Ernest, Joe Williams and himself. He has taken out a ton and a half of ore that will assay about \$700 per ton. This he has taken to Salt Lake City, where he will try to enlist capital to put up smelters in the Frieberg district. It is believed that there is sufficient high-grade ore, when smelted with the low grade, to pay profitably.

**Gillie District.**

**SMELTING WORKS.**—It is stated that a New York corporation is making all necessary arrangements for the construction of a furnace at or near Luning. This is a want which if supplied will bring to the front many of our mines that have long been noted for their unbounded quantity of copper and other base ores. With a suitable furnace at that place, Gillis mining district will be the scene of activity. It has always been understood that on each side of Luning there are mines of fabulous wealth—property which, with half careful management, would furnish employment to hundreds of men and be a profitable investment. The ledges are immense, and the ore of a grade which if worked at home would pay handsomely. In addition to the copper and other base metal mines of that section, there are numerous silver mines, each carrying a percentage of gold which could be mixed with the lead ore and thus be in shape for the smelter. Should the contemplated smelting works be erected by this New York syndicate it will be but a matter of a short time when others will be constructed at Hawthorne and vicinity to reduce the ores of Hawthorne district.

**Jefferson District.**

**A FEW STILL THERE.**—Belmont *Courier*, March 17: The only parties at present working in the mines of this once famous district are Charles Kanroha, the Nelson Bros., E. Frank Corriolo, the Harrison Bros. and James Bryson. They are all taking out ore of a good grade. Kanroha will start up his mill as soon as the weather will permit, so also will the Harrison Bros. They expect to make a profitable run this summer. At one time Jefferson was a camp of considerable importance and its mines producers of silver bullion in large quantities, and one of them—the Jefferson—paid dividends, but the owners deeming it wiser to operate them for stock deals, coyoted near the surface with the ledges, uncovering a small body of rich ore whenever they wanted their stock to rise. When it reached their figure they would unload and then levy an assessment, and as it dropped in price gather it in again. Successive deals of this character disgusted the public. Were the mines of Jefferson properly treated it would be a rich and populous camp; bad management, however, has given it a setback that has not yet been overcome. We think that the day is not far distant when Jefferson's mines will be operated by parties who will make them yield their wealth.

**Northumberland District.**

**LOOKING BETTER.**—Belmont *Courier*, March 17: From Mr. Brewer we learn that the Grant mine in Northumberland district, Nye county, owned by Adams, Brewer & Co., is looking better and better as the work of development is advanced. The face of the tunnel is all in ore and the prospect for uncovering a large body of it is excellent. Assays from samples of the late strike range all the way from \$50 to \$150 per ton. It is the intention of the owners to push the work in the mine with energy.

**Pioche District.**

**NEW COMPANY.**—Salt Lake *Tribune*, March 25: There are big things in store for Pioche. A new company is going in there and a deal is now pending which means a rejuvenation of the camp. But the preliminaries are not yet complete, so the parties concerned are lying low and propose going gunning for the first newspaper man who gives the snap away.

**Revelle District.**

**PAY ORE.**—Eureka *Sentinel*, March 24: John Norris has struck a body of good pay ore at Revelle, sufficient it is said to start up a mill this spring.

**Secret Canyon District.**

**WATER JACKET.**—Eureka *Sentinel*, March 24: "Doc" Hamilton is getting some rich ore from the Water Jacket mine in Page canyon.

**Tybo District.**

**BETTER ORE.**—Eureka *Sentinel*, March 24: The Dimmick mine we learn is looking better than ever, and the ore is richer as depth is attained.

**ARIZONA.**

**AURIFEROUS CLAY.**—Phoenix *Arizonian*, March 20: D. E. Keating of Providence, Rhode Island, and R. J. Kerr of Tucson, arrived in Phoenix last evening. The gentlemen are interested in a mining project that is likely to greatly advance the interests of Phoenix. The enterprise comprehends the working of a large deposit—several hundred acres in extent—of auriferous clay, near the mouth of Humboldt creek. Their placer ground is on the southern edge of Yavapai county, and but a few miles north of the Maricopa county line, and has long been known for its vast richness. Heretofore, for the lack of sufficient means, it has been impossible to work

the grounds, but it is now proposed to dam the creek, provide a reservoir, and with the water thus stored, to work the mines by the hydraulic process. Considerable machinery for the proposed enterprise has already been received at the depot here, and it is the purpose of Messrs. Keating & Kerr to immediately perfect all arrangements for the thorough working of the mine. Phoenix will benefit greatly from the trade which the new mining camp will create.

**VARIOUS MINING CAMPS.**—Prescott *Journal-Miner*, March 22: F. R. Raymond says his Kirkland valley mining claim is opening up well. John S. Jones brought in a \$2000 bar of gold from the Standard mill to-day. Two wagons with 8 tons of ore from the Congress mine arrived at the sampling works to-day. E. E. Wann, superintendent of the Eta mine, sent out 4 teams to-day loaded with supplies for his camp. Mr. Prout, in charge of Copper Basin mines, is well pleased with the showing made in the development of that property. A. J. Rupert and sons continue to run their Huntington battery on rich ore from their Groom creek mines. The shaft of the Congress mine has passed the 200-foot level, the ore body continuing. There is at present a force of 25 men employed. An \$1876 bar of gold was brought in from the Lynx creek hydraulics, as a result of a partial cleanup in some side boxes, of less than 20 days' run. Robert Atkinson, in the experimental run recently made with an arastra on a ton of ore, carefully weighed, from his Spruce canyon mine, cleaned up \$82 in gold. John Owens, better known as "Chloride Jack," the discoverer of the McCracken mine, in Mohave county, in 1874, is in Prescott. He says he has recently located a mine in the Santa Maria district which is better than the McCracken. The *Herald* announces that a 7000-pound portable boiler passed through Phenix en route for the golden mesas of Humboldt creek, where extensive hydraulic operations are about to be inaugurated. The district is in Yavapai county. E. E. Wann, superintendent of the Eta mine, has about 30 men engaged building a road from the mine to the mill, a distance of 6 miles. He has closed work temporarily in the mine. He expects to be able to start the mill in about 60 days. Twenty-four men are now employed in the United Verde copper mines at Jerome, and the force is being increased daily, as room can be made, to work them successfully. It is expected that during the year there will be from 300 to 400 men employed in the camp. Alex. Harris left to-day with a load of supplies for the Gold Wire mine in Malpais district, near Squaw peak. This mine is owned by Mr. Harris and the McKesson brothers, and work will be resumed at once on the property, and an arastra started to work the ore. The property is rich in gold.

**MONARCH GROUP.**—Arizona *Enterprise*, March 24: The Monarch groups of mines, located in the Casa Grande district, now being developed by Kansas City capitalists, show a really remarkable development, much better than the most sanguine of its friends hoped for. They now have a tunnel in 725 feet. Without any further developments this company has sufficient ore in sight to run a 20-stamp mill several years, and their intention is to erect such a mill at once. The opening of this mammoth property will be the means of directing attention to this really deserving district, one that offers more and better opportunities for the employment of capital in a legitimate way than any that can be named. Just east adjoining the Monarch group is what is known as the Silver World group, owned by residents of this county. Limited in means, their developments have been limited, yet sufficient has been done to demonstrate that this property will take rank with the Monarch and other large properties of which this district is destined to produce several in the near future.

**COLORADO.**

**SAN JUAN MINES.**—Silverton *Miner*, March 23: The Greco Mountain strike is holding out splendidly. The Bear mine has 400 tons of ore out ready for shipment. The North Star on Solomon has over 400 tons of high-grade ore sacked for shipment. Only 40 feet yet remain to be run in the great North Star crosscut on Sultan mountain. It is now in over 2000 feet, and another month will show to the world what San Juan county can do in the way of deep mining. Mr. Harlow has started work on the Star of the West. The trail has been dug out and provisions to last until May 1st have been taken up. A tunnel 30 feet long through the snow was run in order to reach the cabin door. The Bear mine resembles a quarry. It is actually the largest body of ore in the county without a single exception. This immense ore body runs from 4 to 12 ozs. gold and from 20 to 40 ozs. in silver to each and every ton. The Titusville is part of this vein. The mine is at present being worked under lease. The Monster is a gold property that has become very prominent during the past year by reason of its large and uniformly rich veins of quartz, and bids fair in the near future to eclipse the celebrated Sampson in its palmy days. Mr. Fisher has in contemplation the erection of a stamp-mill for the treatment of his quartz, and the other extensive operations promised warrant the prediction that Gladstone will come in for quite a boom this season. Everybody in San Juan will be glad to learn that Otto Mears has struck it richer than ever in the Buckeye. For the last 40 feet the men have been in big pay, and a month ago Otto remarked that if the ore held its own for 40 feet a half million dollars would not buy the mine. It has not only held its own, but is improving constantly, and yesterday he received notice that there was 2½ feet of solid gray copper in the breast, and over 100 tons on the dump. This strike sends the Buckeye to the head of the list.

**GEORGETOWN NOTES.**—*Courier*, March 20: The Pelican-Dives is working 30 men. Work has been resumed on the Maple Leaf lode, Fall River. Ore of an excellent grade is coming from the 150-foot level on the Centennial. The entire Jo Reynolds and Red Elephant product will be sent to Georgetown. A good body of ore is said to have been struck by the Favorite Co. at Dumont. Several runs of high-grade ore were made from the Equator last week. First-class ore from 600 ounces. Some of the heavy lead ore from the Lucy returns over 600 ozs. in silver to the ton, and a cubic foot of the ore will weigh over 500 pounds. Several of the Centennial people will probably be here this week to definitely determine the course to be pursued in working their

mine—whether it shall be done by days' pay, contract, or under leases. A foot of as fine ore as ever came out of the Colorado Central was struck last week. It is chock full of gray copper and ruby silver, and if it holds out as the ore bodies in the levels above held out, there's a bonanza to be extracted the coming year. The crosscut to the Lucy mine has reached the vein. A contract will be let to drive a drift some 300 feet to the ore chimney exposed in the upper adit. It is highly probable, however, that a good body of ore will be struck almost any day, as the gangue is impregnated with blotches of what appears to be very rich mineral.

**DAKOTA.**

**SILVER CITY.**—Deadwood *Pioneer*, March 20: Dave Short, in from the Silver City, yesterday, states the shaft has now reached a depth of 65 feet. Himself and another are at work sinking for greater depth as rapidly as they can. The bottom of the shaft is in good ore, first encountered when a depth of not more than ten feet had been attained. Developments will be pushed continuously during the summer. The mine is situated in Bald mountain district. The ground is owned by individuals, who until date have refused to transfer their interests to a corporation. All reports from the Oxford concur that only most encouraging results are continuing to be met. In the language of a well-known miner in position to know wherof he speaks, "the body of lead ore is strengthening with every shift worked." Within a few days work will be resumed at the Prior, Bald mountain. One of Major R. L. Hopkins' centrifugal amalgamators is expected by express to-day. It will be placed on trial at the Golden Star mill, Lead.

**IDAHO.**

**ORE SHIPMENTS.**—Bellevue *Herald*, March 20: Through the kindness of the sampler and depot officials the *Herald* gives the total ore shipments for March arranged as follows: Minnie Moore, 13 cars, 244 tons, \$22,400 value; Queen of the Hills, 13 cars, 37½ tons, \$4125 value; Red Wing, ½ car, 5 tons, \$500 value; War Dance, 1 car, 15 tons, \$1900 value; Red Elephant, 1 car, 10 tons, \$1200 value; Mayflower, 1 car, 16 tons, \$2560 value. Total, 19½ cars, 307½ tons, \$32,685 value. The *Herald* has no way of exactly calculating on the value of the ore shipped, but gives figures that can be relied on as very near the truth. For instance, the Minnie ore is given at \$100 per ton; Queen, \$110; Red Wing, \$100; Red Elephant (Deer Creek), \$120; War Dance (Deer Creek), \$120; and Mayflower (bullion) \$160. The Minnie Moore will ship three cars Monday. For February the Minnie Moore shipped 252 tons at a valuation of \$25,200, but the March shipments promise to nearly double these figures, already being about as much. The Bellevue sampler does all the sampling for the entire lower river section at present.

**STRIKE IN THE COEUR D'ALENE.**—Butte *Inter-Mountain*, March 19: The Diamond Hitch mine is located in the region between Burke and Wallace in the Coeur d'Alene country, and is owned by Lehes Bros. et al. of Wardner. Joe Powell, who is now in the city, reports that a strike of wonderfully rich ore was made in the property last week, some of it assaying as high as \$600 per ton. It is a silver-lead ore of the same character as that of the Tiger and Poorman. The find has created considerable excitement, and the value of all silver-lead properties on the South Fork has gone up on the jump in consequence. The Coeur d'Alene is a good place to own a mine just now.

**MONTANA.**

**WEST GRANITE.**—Butte *Inter-Mountain*, March 20: There is an unverified rumor upon the street to-day that Manager Pardee has made the statement that the strike they have been laboring and praying for in the West Granite for the past two years has been made at last, and that they have now got the Granite vein, and it is as rich and wide as it is in the Granite Mountain workings. This statement should of course be received with some caution, as it is only a rumor as yet, but this much is certain, that it has received sufficient credence in St. Louis to cause a movement in the stock. The news of the strike, if any has been made, has not yet reached the general public at St. Louis. If the report shall prove true that the Granite vein has been struck, Montana will turn out several new millionaires this year.

**ROCHESTER DISTRICT.**—Cor. *Inter-Mountain*, March 24: This old-time mining district, after lying dormant for a long term of years, is again looking up and bids fair to become a profitable bullion-producer. Messrs. Alward & Merk operated the old Wateksa mine on a lease during the past season and shipped at a fair profit about 200 tons of ore. This returned them net from \$30 to \$40 per ton; 90 per cent of their value in gold and the balance in silver. This mine was considered worked out years ago. A 10-stamp mill was run for a long time and the owners were so positive the property was cleaned out that the mill was dismantled and moved away. All the ore that Messrs. Alward & Merk took out last season was above the water level, and at no place are they lower than 180 feet on the ledge. It is their intention to put on an engine and pump this season and test it below the old workings.

**A NEW MILL.**—Mr. E. Mueller, formerly connected with the Tuscaraora at Argenta and the Moontana Copper Co. of Butte, located here last season and acquired a half interest with Bertini in the American lead. He has erected a 10-stamp gold-mill, with jigs and Evans tables for concentration. His mill was completed during the winter and in a few days he will start up. They have a very fair prospect to start upon. They have their ledge opened by shafts at three different points to a depth of 70, 100 and 30 feet and a showing of from 18 inches to two feet of ore in each place. This, with their prospect for custom ore, will no doubt keep their mill steadily at work. Close by the American is another property owned by the White Bros., called the Shoemaker. This mine has been worked in a small way for a good many years and the ore worked in arastras, but they have erected a small stamp-mill with a capacity of eight tons daily and a Frue vanner for concentrating. These are the principal gold showings in the district, but several very prom-

ising lead prospects I have been opened this winter and quite a number of tons of ore sacked for shipment averaging from 50 to 60 per cent lead. The leads as yet are small, but sufficient is in sight to amply repay development work. There are at least 50 men at work in the vicinity on the mines spoken of and other prospects.

**THE COMBINATION MILL.**—*Inter-Mountain*, March 23: At a meeting of the trustees of the Combination Company night before last, the principal topic of interest to the public was the starting of the mill. The mines were visited last week by Messrs. Barret, Goodale and Harper, and it was their belief that it was not advisable to start the mill for about a month yet. By that time they will have a big supply of ore on hand and certain development work will be completed—that is, the body of higher grade ore found in the shaft of the Combination will be reached by the tunnel. In addition to all this the roads will be in much better condition, so that hauling in supplies will not be so expensive.

**TWO EXCELLENT PROSPECTS.**—Butte *Miner*, March 21: The lessees of the Enterprise mine, which is located just north of Meaderville, are now working it in a practical way for all it is worth. Six men are employed, and the main shaft which is now down 115 feet will be sunk to a depth of 150, at which point a drift or crosscut will be begun. Good ore has been encountered and the gentlemen are entirely satisfied with the present outlook, and expect that in a very short time they will realize a handsome return for their labor and expenditures.

**NEW MEXICO.**

**FROM VARIOUS CAMPS.**—Western *Liberal*, March 23: The Humboldt Co. has struck a rich body of ore in the Selaroe at 80 feet. Messrs. Boucher & Buck made a trip to Gold Hill this week on mining business. Gold Hill is looking up. Several mining men of prominence are taking an interest in the developments which are going on in that camp. Col. Jack Fleming of Silver City accompanied Messrs. Hart & Phillips out to Stein's Pass and took a look at the Bachelor, with which he was more than pleased. The miners of this region now have another market for their ore. Last Monday the new International smelter at El Paso, C. C. Fitzgerald, proprietor, blew in for the first time, and on Tuesday produced its first bullion. The El Paso papers pronounce it a great success. It is now running a 40-ton furnace and has a 60-ton one on the road. Frank Baxter of Morenci made a trial shipment of ore in the El Paso smelter. The ore, 15 tons, was from the Comstock and Silver Twigg mines situated in the Silver camp. Mr. Baxter returned Saturday well pleased with his shipment, as the 15 tons netted him over \$1500.

**OREGON.**

**ALTHOUSE.**—Cor. *Rogue River Courier*, March 23: The cold weather tries the tempers of the miners of this district. Water is scarce and the snow melts but slowly, although the days are, as a rule, pleasant after the sun gets above the treetops. Few of our miners are doing much in the way of work, and there is little of interest to report. James Turnbull, one of the old-time miners of the creek, through sickness, had to sell out his claim at upper Grass Flat, and quit mining for a time, at least. The Doney Bros. of California were the purchasers.

**PROSPECTING.**—Jacksonville *Times*, March 23: Considerable prospecting is now being done in Jackson and Josephine counties. The miners of Galice creek are busy and expect to make a good showing this season. Water is falling fast in many places and quite a number of the miners are engaged in cleaning up. The mines of Wimer Bros., Dess'les & Connell, in Waldo creek, Josephine county, are being operated on a large scale. At the Sterling mine two giants are being operated day and night and much ground is being moved. Good results are promised. Good work is being done at Simmons, Ennis & Co.'s mines near Waldo, which will soon be thoroughly opened. The big ditch has gradually washed out a huge cut, which will greatly facilitate operations. The Swinden mine and the quartz-mill near Gold Hill still lie idle. It was bonded to California parties for a large sum of money, but it is said that the time has expired and no one has appeared to pay the money and take the property. M. A. Brentano of Wagner creek brought down some bullion from the Golden Spike Co.'s mines last Saturday. Much good is now being done in that district, and we may expect to see some of the best quartz ledges on the North Pacific Coast opened there. R. A. Jones and Stilly Riddle of Canyonville have purchased the tailings of the Sugar Pine ledge, Galice creek district, owned by Green Bros., and will immediately take steps to reduce them. They have been assayed, and it has been found that they contain a considerable percentage of gold. Messrs. Jones & Riddle are looking after certain ledges in Josephine county.

**UTAH.**

**GOOD COOKING COAL.**—Salt Lake *Tribune*, March 22: An excellent quality of cooking coal has been discovered at a point some 30 miles west of Price station, on the Denver & Rio Grande Western, and about 8 miles from the railroad. Several well-known Salt Lake capitalists have taken hold of the matter and propose to patent the land as early a date as possible, and develop the mines. Those who have taken hold of the matter are T. R. Jones, W. H. Remington, ex-United States Marshal Ireland, Geo. A. Lowe, Mathew H. Walker and others. They will enter the land under the coal land laws. It is understood that the D. & R. G. W. people have a determined to take hold of the matter and put the coke and coal on the markets. Some of the parties above mentioned are now having furnace tests of the coal made for the purpose of ascertaining the quality of the coal and the per cent of coke it will yield. Should it be determined that that per cent is such as will make the working of our smelters will no longer be compelled to send to McConnellville for coke to use in their furnaces, or even to send to the Elk mountains in Colorado, where a most excellent article of coke is made. The development of these mines and the result of the test being made will be looked for with interest, as the discovery of good cooking coal in this Territory would be the beginning of an important industry.

# COMPRESSED AIR and WATER POWER MACHINERY.

**RIX & FIRTH, 225 and 227. First St., San Francisco.**

## NATIONAL AIR COMPRESSORS.

SINGLE OR DUPLEX, STEAM OR BELT POWER.  
62 Sold on the Pacific Coast.

**KNIGHT'S WATER WHEEL,**  
—FOR—  
**MILLS, PUMPING AND HOISTING.**  
Over 300 in use. All estimates guaranteed. Send for Circular.

## MINERS' HORSE WHIM.

All wrought iron. No gears, no breakage. One horse will easily handle rock or water to a depth 350 feet, giving entire satisfaction to the prospector. Price, complete, \$200. 150 sold on this Coast.

**NATIONAL ROCK DRILL.**  
200 Sold on this Coast. Has less repairs than any other Drill.

Centrifugal Roller Quartz Mill.

**F. A. HUNTINGTON,**  
MANUFACTURER OF  
**Centrifugal Roller Quartz Mills,**  
**CONCENTRATORS AND ORE CRUSHERS,**

ORE CRUSHER

## FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

**IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,**

And renewals will not cost over one-half as much as for stamps. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.

OUR DRY CORN MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

## FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco.  
HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

## SQUARE FLAX PACKING,

Manufactured from strictly first-class Flax and pure lubricants. Superior to all others for Water and Steam. Packs with less friction and makes a tighter joint than any other packing made. Imitations of inferior quality having been put upon the market, we have been compelled to adopt the above trade-mark, and all of our packing will now have a RED CORD running through the center its entire length. See that you get it and take no other. Sold by all Hardware Dealers. Price, 50 cents per pound. W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market St., San Francisco, Cal.

## DEWEY & CO.'S

Scientific Press

Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us offer to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St. S. F.

## ARE YOU GOING TO PUT UP MACHINERY OF ANY KIND?

Are you going to make any change in machinery? Do you want Pulleys on Shafting already up? If so, don't fail to look into the merits of

## THE DODGE PATENT INDEPENDENCE

## WOOD SEPARABLE OR SPLIT PULLEYS.

They are the Lightest, Strongest, Best Balanced and Most Convenient Pulleys Made in the World. Entirely new and original. Adapted to any power required. Time, trouble and money saved by using these pulleys. Price List and Catalogues mailed free.

JOHN SIMONDS, Pacific Coast Agent, 509-513 Mission St., S. F.

## FOR SALE.

### A Complete Ten-Stamp Mill (NEW),

Suitable to work free-milling or sulphuretted ores. Will be delivered on board cars at Merced, if desired. Address

F. T. HOUGHTON,  
Hornitos, Cal.

## INVENTORS, TAKE NOTICE!

L. PETERSON, MODEL MAKER,  
258 Market St., N.E. cor. Front (up stairs), San Francisco.  
Experimental machinery and all kinds of metal, tin, copper and brass.

## San Francisco Cordage Factory.

Established 1856.

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice

TUBBS & CO.

611 and 613 Front St., San Francisco.

## 3000 Engravings for Sale.

We have 3000 or more duplicate Engravings and Electrotypes (which have appeared in this and other papers,) for sale at very low prices when taken in considerable numbers. Address, DEWEY ENGRAVING CO., at the office of this paper.

# BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia Iron in Quartz Screens. Planished iron screens at nearly half my former rates.

I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

# PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass, Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot-Cut or hurred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (five).

Orders promptly attended to.

San Francisco Pioneer Screen Works,  
21 & 223 First St., San Francisco, Cal.

JOHN W. QUICK, Proprietor.

WATER TANKS, WINE TANKS!

CALIFORNIA WINE COOPERAGE CO.,

FULDA BROS., Proprietors,

30 to 40 Spear St., San Francisco.

ALL KINDS OF CASKS, TANKS, Etc.

SHIP, Mining, and WATER TANKS a Specialty.

LIGHTNING WELL MACHINE MAKERS.

We are the largest Manufacturers—have sunk 629 ft. in 10 hours. Our Encyclopedia of 900 engravings of Well, Wind-Mill, Prospecting, Pumping and Diamond Pointed Rock Drilling Machinery, or our treatise on Natural Gas will be mailed for 25 cts. Are seeking parties who advertise to make Hydraulic machinery, and their customers for using.

THE AMERICAN  
WELL WORKS.  
AURORA, ILL.,  
U. S. A.

# THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

# JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale.

GENERAL AGENTS, SAN FRANCISCO CAL.

SOLE AGENT FOR

Adamantine Shoes, Dies and CRUSHER PLATES,

—AND—

Chrome Cast Steel for Rock Drills, Etc.

ADAMANTINE.

H. D. MORRIS,

220 Fremont St., San Francisco,

MANUFACTURERS' and PURCHASING AGENT.

Special attention given to purchase of

MINE and MILL SUPPLIES.

ADAMANTINE SHOES AND DIES.—Guaranteed to prove better and cheaper than any others. Orders solicited, subject to above conditions.

H. D. MORRIS.

# THOMAS PRICE'S ASSAY OFFICE,

CHEMICAL LABORATORY,

BULLION ROOMS and ORE FLOORS,

524 Sacramento Street, San Francisco, Cal.

COIN RETURNS ON ALL BULLION DEPOSITS IN 24 HOURS.

WORKING TESTS OF ORES BY ALL PROCESSES.

SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.

Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

## The Matte Process.

EDITORS PRESS:—In your last issue you print a paper written by W. L. Austin of Toston, Montana, in which the author seems to claim to be the first who, in America, successfully worked the matte process of silver smelting, at least one must conclude so from his expressions: "No American precedent" and "Vague rumors of attempts at Colorado." The general reader will be astonished that such an important process has been overlooked and praise the fortune of the country that Mr. Austin had the happy idea to find that out. Mr. Austin's brother metallurgists, however, respectfully protest against any further rediscoveries from professional men. We leave that to those colleagues who when their patent appears in court can swear that they never heard of anything like it before or after. "How," exclaims the lawyer to the attentive jury, "how can the other side claim this invention is not original when we have proven that it is the original invention of Mr. Patentee?"

This matte process has been for years the process of the Boston & Colorado Smelting Works of Blackhawk, near Central City, Colorado, one of the professionally and financially most successful metallurgical works in America, which about eight years ago removed to Denver. I visited these works in 1879 and was much impressed with the scientific management and practical arrangements. The works had the reputation of jealously hiding their secrets. These secrets, to the average mill-runner, consisted of a very sharp, active and well-informed young Englishman, not of the "practical" school of his time, as superintendent, an excellent system of sampling and assaying, a rapid discernment of this metallurgical value of each batch of custom ore and a general knowledge of "which is which" without working four weeks in the laboratory to solve the riddle.

The works have been described before, and I will only recapitulate that part of the pyritic ore was roasted to a certain percentage of sulphur and mixed with raw ore to get suitable proportions for forming matte and slag. The matte was crushed, roasted, extracted with water; the silver from the solution of sulphate of silver precipitated by copper, the copper by iron, the gold extracted from the residue of the leaching by a special smelting for matte with gold ores. This roasting was done in a "Fortschaffelungs-ofen," for which excellent German word an English translation is sorely wanted, the smelting for matte in a reverberatory. This reverberatory furnace made quite an impression upon me. When I asked to see the fireplace the whole front of the furnace rose up and disclosed a whole cord of wood stacked in the regular style of densely packed cord-wood. I did not think at that time that 10 years later the inventor of that fireplace would be classed as nothing but "a vague rumor of attempts at Colorado."

San Francisco, March 27, 1888.

## Eureka-Como.

This property has been given a notoriety of late, from the fact that a number of capitalists of the city of Stockton purchased it and are making preparations to develop it to greater depths. It is situated in Como mining district, Lyon county, Nevada, 14 miles due south of the Comstock. The formation in which the lead appears is said to be identical with the Comstock belt. The fissure at a depth of 200 feet is 190 feet in width and heavily mineralized. There are four distinct seams of quartz from 3 feet to 27 feet wide, the intervening spaces being filled with vein porphyry. Ore taken from these seams yielded \$24.50 per ton, being 65 per cent of assay value.

At and above the 200 level there is said to be a large quantity of this grade ore, which will be worked after the new owners have supplied concentrators. The Symons Bros., practical and experienced miners, with limited means, have made the present development, and have hoisting apparatus to sink several hundred feet.

Experienced miners are of the opinion that the several veins will run into a large body of ore before reaching the next 100 foot level. About 75 per cent of the yield is gold. This syndicate has incorporated with a capital stock of \$1,000,000, divided in 100,000 shares, and has already purchased additional machinery and active work will be commenced at once. The directors are Capt. J. B. Sears, C. Hurd, H. W. Cowell, R. W. Tulley and Thomas Powell. J. B. Sears is president and W. L. Baker secretary. Capt. H. S. Symons, superintendent, has had 25 years' experience on the Comstock, and has given his opinion that this mine will prove a bonanza. The stockholders are leading men of the San Joaquin valley, and will furnish ample capital to develop this property, with a view of making it a dividend-paying mine.

**THE PELTON WHEEL.**—Attention is called to the notice in another column of a change in the business of the Pelton water-wheel. The demand for these wheels had become quite beyond the capacity of the interior shop where they have been previously made, and the change will be greatly to the convenience of purchasers as regards promptness in filling orders and facility for shipment. Mr. Pelton will hereafter reside in this city and give his personal attention to the business in all its details, which insures the maintenance of the high character of this wheel in its variety of applications to mining and industrial uses.

## News in Brief.

CHIEF JUSTICE WAITE of the U. S. Supreme Court died March 23d.

SAN RAFAEL is now lighted by electricity, and a petition has been presented asking for an electric road franchise.

AN immense amount of snow fell in Wyoming Saturday. Travel was interrupted, but the stockmen consider the snowfall as highly beneficial.

THE trustees of the Lick free baths will endeavor to have the baths built as soon as possible. James Lick left \$150,000 to build these baths.

ANDERSON, Placer county, from a mining town is becoming the center of a wonderfully developed district, filled with orchards and vineyards.

THE Oregon Agricultural College building near Corvallis will be completed May 1st, accepted by the Governor and turned over to the Board of Regents.

THE gross exchanges of this country for the week ending March 24th were \$908,050,762, an increase of 5.9 per cent over the corresponding period of last year.

THE floods in Germany and Austro-Hungary, it is estimated, cover 200 square miles of territory, and alarming rumors of the extent of this damage do not cease to be circulated.

THE old British war-ship in which Mr. Darwin circumnavigated the world, and began those speculations which have revolutionized science, is now a Japanese training-ship.

SEVERAL buildings on Alcatraz island, San Francisco bay, were destroyed by fire this week. The loss is not over \$2000. None of the more valuable buildings caught fire.

STOCKTON held a mass meeting Saturday to institute measures to thoroughly advertise San Joaquin county. Irrigation, less area in wheat and small tracts devoted to fruit were urged.

THE weather-rop bulletin from Washington says: This freezing weather in the Southern States has doubtless injured small grains, fruits and vegetables in the northern portion of the Gulf States.

A BILL has been favorably reported in the U. S. Senate appropriating the following sums for Pacific Coast quarantine stations: San Diego, \$55,500; San Francisco, \$103,000; Port Townsend, \$55,000.

THE late Kaiser William left by will the greater portion of his fortunes to the Crown Treasury or General fund, and the remainder will be divided between Empress Augusta, Emperor Frederick and the Duchess of Baden.

A BILL to amend the naturalization law so as to require would-be citizens to make oath that they are not polygamists, anarchists or communists has been introduced in this House by Representative Stewart of Georgia.

THE New York Times estimates that the losses to the Government from redwood timber frauds and the operations of the surveyors' ring in California exceed those that were caused by the jobs of the Star Route conspirators.

## Mining Share Market.

While there is little to say concerning mining stocks in this city, as there is not very much interest in them, work on the Comstock mines is being very actively prosecuted. It is expected that the bullion product of the lode the coming month will be about \$750,000, of which Con. California and Virginia should contribute \$400,000. For what some people think is a "played-out" camp, this is pretty good. There would be a good "how" over this yield in newer camps. The Virginia Enterprise says the new ore strikes to report are located in Crown Point, Challenge, Chollar, Confidence and Baltimore. A few years ago a vague rumor of a change of formation in a drift, either for better or worse, was sufficient to give a healthy tone to the entire market from the Original Keystone on the north to the Dayton on the south, a distance of about six miles; but now the development of an ore body over 300 feet long by 30 or 40 wide and 100 or 200 deep, is only deemed sufficient to maintain the price of the stock at the point it attained when it had gained a mere speculative value. Strange, isn't it? But it is true. Hale & Norcross is the case in point. The ore body struck a few months ago has gone on and on in development until it has attained the above proportions, but the stock has only maintained a dreary easiness. But it is now confidently affirmed that the 220 tons daily being reduced at the Mexican and Chollar mills will soon put the mine on the dividend-paying list and start the stock upward with a bound. A heavy shipment of bullion will soon be made.

There is an important strike reported officially from Crown Point, on the 400 level, in a winze started last week. The Yellow Jacket folks have repaired the Santiago mill and are now shipping 100 tons of white rock, or gold-bearing ore, daily from their mine.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

## New York Metal Market.

Telegraphic advices dated Mar. 29th give the following New York prices:

BAR SILVER—93 1/2 per oz.

BORAX—98.00.

COPPER, LARG—\$16.00@16.60.

IRON—No. 1, \$22.00.

LEAD—\$5.00 @ —.

TIN—\$35.60 @ —.

The following is the latest by mail from the "New York Metal Exchange Market Report":

COPPER—Dull, spot closing at \$16.00@16.10. Transferable Notices (Larks) issued at \$16.30 @ —.

LEAD—Firm, at \$6.07@6.20 spot. Transferable Notices issued at \$5.00.

TIN—Quiet at \$36.50@37.00. Transferable notices issued at \$31.50@32.50.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, \$30.00@36.25; Billiton Tin, \$37.50 @ —.

Rangoon Tin, \$38.00 @ —.

Baltimore Copper, \$14.75@16.00.

Orford Copper, \$15.50@15.75.

R. S. G. Copper, @ —.

Foreign Lead, \$3.40@3.50.

Foreign Spelter, \$6.10@6.30.

Antimony, \$11.50@16.00.

## New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

SANTA BARBARA BITUMINOUS ROCK CO., March 25th. Capital stock, \$100,000. Directors—Joseph Scheerer, Clemons Scheerer, F. M. Frsnnd, David Fairfield, and Samuel C. Mille.

CONSOLIDATED UNION M. CO., March 25th. Location, State of Sinaloa, Mexico. Capital stock, \$1,000,000. Directors—J. Aegerter, J. F. Hoelling, A. B. Green, Isaac Blinhome and Isaac Brunbanm.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

THE members of the Veterans' Home Association held a meeting on Saturday evening, at which W. J. Ruddick, George Walsh and W. H. Hart were chosen directors. Walsh will hold for two years and the others for one. The directors were chosen to fill vacancies.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SHINGLE-SAWING MACHINE.—Wm. A. Campbell, Portland, Oregon. No. 379,856. Dated March 20, 1888. This improvement in shingle machines consists especially in the employment of a tipping table by which the bolt from which the shingles are to be cut is alternately tipped from one side to the other, so as to give the proper taper to the shingles, a means for adjusting and regulating said table, and an automatic mechanism by which the tipping or tilting of the table is produced, together with the mechanism for adjusting, raising and lowering and centering the table, adjusting the lower steps of the saw arbor, and certain details of construction.

GLOVE.—Fred H. Busby, S. F. No. 379,855. Dated March 20, 1888. This invention consists of making the welt for the glove seams of felt, which possesses the qualifications of cheapness, durability and appearance. The welts are generally made of leather or sheepskin. In using skins the length of the strip or welt is necessarily limited to the size of the skin out of which it is cut, and it therefore becomes necessary to piece or join the welt in the glove, and no matter how neatly this may be done, it can always be seen. Again, the cut edge of the welt shows white. In using felt it can be prepared in a continuous length, and is available for being wound on spools so as to be used with facility. Again, the felt is absorbent, and in a measure takes up the deleterious acids of the tanned leather of the glove and thereby preserves the stitching. The felt welt may be made in any color to suit the glove. The felt is elastic, flexible and soft, and holds the stitches of the seam well, affording a better cushion for said seam than the ordinary skin welt.

ELECTRIC ANNUNCIATOR.—B. N. Botts, Paso Robles, San Luis Obispo Co. No. 379,758. Dated March 20, 1888. One of the "claims" to this patent is as follows: In an electric annunciator, a fixed dial and a hand moving over it, an electric motor, and connections by which it operates the hand, in combination with a disk on the hand shaft, electrically connected with the motor; fixed springs against which the periphery of the disk moves, and circuit wires from the subscribing stations to said springs whereby the motor is driven and the hand moved over the dial, the switch by which the current is diverted to cut the motor out of the circuit and arrest the hand; consisting of an insulated contact piece in the periphery of the disk, an insulated ring electrically connected therewith, and the switch-current from the ring. The call-bell in said circuit for giving notice of the arrest of the hand, and the means of checking the momentum of the hand when the motor is cut out of the circuit; consisting of the electro-magnet in the motor circuit, the pivoted armature, and the spring causing the armature to normally bear when unaffected by the magnet upon the driving connections, thus breaking them.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Uncle Sam (New Mexico). March 24th, \$15,000; Standard Con., 26, \$7802; North Belle Isle, 26 \$50 000; Alice, 20, \$17,464; Germania, 20, \$2064; Hanauer, 20, \$3600; Germania, 22, \$1796; Hanauer, 22, \$1775; Germania, 23, \$1554; Hanauer, 23, \$1800; Argus, 24, \$5127; Con. California and Virginia, 24, \$94,948; Hanauer, 24, \$1600; Alice, 24, \$17,464; Moulton, 24, \$20,288; Blue Bird, 24, \$15,968; Silver Bow, 24, \$16,688; Lexington, 24, \$21,264; Pollock, 24, \$8368; Germania, 25, \$1673; Hanauer, 25, \$3300; Queen of the Hills, 25, \$1350. The hanks of Salt Lake City report the receipt for the week ending March 21st, inclusive, of \$76,931.06 in ore and \$68,882.89 in bullion; a total of \$145,813.95.

THE PELTON WATER WHEEL

Gives the highest efficiency of any Wheel in the world, and is everywhere recognized as the standard for high pressure service.

UPWARDS OF 500 IN USE.

From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the country. It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRICAL TRANSMISSION.

Power from these Wheels can be transmitted by electricity several miles with small loss, and made available for running Mills, Pumping and Hoisting Works, Trains, etc. Address:

The Pelton Water Wheel Co., 127 FIRST ST., SAN FRANCISCO, CAL.

HORACE D. RANLETT,  
Ores, Mining, and Commission,  
420 Montgomery St., S. F.  
BUSINESS MANAGER OF

UNION COPPER MINE, Calaveras Co.,  
NEWTON COPPER MINE, Amador Co.

Correspondent as Agent for Smelters in London, Liverpool, New York, Boston and Baltimore.

Twenty years experience, in California, purchasing Ores and dealing in Mines.

Special attention given to management and sales of mines and purchase and shipment of copper produce.

QUARTZ MINES FOR SALE.

Under good bonds, several first-class Old Quartz Mines, located in Amador county on the true lead; well developed and ready for mills. Samples and all particulars at office of the above.

WINCHESTER HOUSE,

44 Third Street, San Francisco, Cal.

This Fire-proof Brick Building is centrally located, in the healthiest part of the city, only a half block from the Grand and Palace Hotels, and close to all Steamboat and Railroad Offices.

Laundry Free for the use of Families  
HOT AND COLD BATHS FREE.

Terms, Board and Room, \$1.00 per Day  
And upward.

ROOMS WITH OR WITHOUT BOARD.

FREE COACH TO THE HOUSE.  
J. POOLEY.

THE PELTON WATER WHEEL.

Notice is hereby given that the business of the Pelton Water Wheel has been removed from Nevada City to San Francisco, and will be hereafter conducted under the name of the Pelton Water Wheel Co.

Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dewey & Co., Publishers, 252 Market St., San Francisco.

FOR SALE.

- 2 Triumph Concentrators.  
1 New 12-inch, 35 H. P. Engine.  
VERY CHEAP. Apply  
130 Sansome St., room 12.

Sectional View of Pulverizer.

PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the superheated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

PNEUMATIC PULVERIZER COMPANY,

2 and 4 Stone Street, NEW YORK.

Mining Machinery For Sale.

Having completed our tunnel, we offer for sale:

- 1 No. 4 Burleigh Air Compressor, with shaft arranged to be run by steam or water power.
- 1 No. 4 Duplex Clayton Air Compressor.
- 1 Air Tank, 48 in. by 16 ft
- 1 Llewellyn Water Heater, 24 in. by 8 ft.
- 1 No. 3 Knowles Pump.
- 1 Small Hooker Pump.
- 7 Burleigh tunnel drills.
- 1 Lot of Drill Extrae.
- 1 "E" Battery for blasting.
- 1 Triple-Geared Hoisting Engine, built by Copeland & Bacon.

The machinery is all in good order and can be seen at our works. For prices and other information, address

# \$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR  
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS  
(\$575.00) F. O. B.**

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885. 271

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

ADAMS & CARTER.

Protected by patents May 4, 1869; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 13, 1883. Patents applied for.

Room 7, No. 109 California Street, SAN FRANCISCO, CAL.**

# \$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE  
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

## Land Reclamation.

### An Immense Pumping Plant for Reclaiming Tule Islands.

In the Pearson Reclamation district, near Courtland, Sacramento county, in this State, some very extensive drainage operations have been conducted in the past few years, and they

larger pumps and the same engine, three times the work was accomplished. It was exchanged for a 12-inch Turbine pump, and a 15-inch Gwynne pump was added. These were calculated to raise at least 10,000 gallons of water, with an indicated 40-horse power, against a head of 10 feet.

The results of accurate measurements made

to be driven by a compound condensing engine. The average of several tests conducted personally by Mr. P. J. Van Lohensels, the agent of the Reclamation Co., showed its capacity to be 37,907 gallons per minute at a lift of 11 feet 7 inches, the engine indicating 156-horse power, with a consumption of 4.4 pounds average Sydney coal per actual horse-power of water raised

side of the engine, and arranged so it could be coupled directly. The pumps are made so that at a low lift, if the outside water is not too high, both pumps are used; but if the water in the river or slough outside the level is over 12 feet, one pump is disconnected and only one run.

With this increase of machinery they were

PLAN OF RECLAMATION PUMPING PLANT DESIGNED AND ERECTED BY THE SAN FRANCISCO TOOL COMPANY.

have now the most extensive pumping plant for reclamation purposes in the United States. The Pearson Reclamation district is one of the largest on the coast. It consists of 8800 acres of very fertile land, surrounded by a well-constructed levee, of an average height of 18 feet, and some 15½ miles long.

When they first began operations there a few years ago, the San Francisco Tool Company furnished a ten-inch pump, with a capacity of 3000 gallons per minute, run by a 12x24 Meyers cut-off engine. This worked for one season, but was not sufficiently effective for the large tract it was designed to drain, being unable to cope with the seepage water. With

by a thoroughly competent and disinterested civil engineer, showed that with only 88 revolutions of the engine, or 264 revolutions of the 15-inch pump, and 234 revolutions of the 12-inch pump, they were able to raise over 16,000 gallons per minute, with an indicated horsepower of about 50, against a head ranging from 9 to 14 feet. The average daily consumption of coal was 3750 pounds of South Prairie screenings for a run of 24 hours.

The next season they took out the 12-inch and procured another 15-inch, making two 15-inch pumps. This was in the fall, but in the following spring an order was given to the Tool Company for a 30-inch siphon centrifugal pump

per hour, the most satisfactory and economical showing so far made by any reclamation pumping plant.

At the time the 30-inch pump was ready to run there were 2000 acres of land under water, resulting from the excessive rains of spring, and by the middle of June the water was all pumped off, and there was a crop of barley in places where the water had been seven feet deep. In one part of the 2000 acres there was a lake of 350 acres seven feet deep.

In the following fall the Reclamation Co. decided to still further enlarge the pumping plant and put in another 30-inch siphon centrifugal pump. This was placed on the other

enabled to increase the acreage under cultivation, and 3000 acres were now added, so that now the whole district is being cultivated. They can now handle all the water that they have to contend with at any time, and it cannot get "the upper hand" of them, or catch up with the pumps.

In the accompanying engravings the plan view shows the two 30 inch siphon centrifugal pumps with the compound condensing engine between the two, so arranged that by the connecting couplings either one can be run independently. Each pump has two separate suction pipes issuing from the sump on the inside

(Concluded on page 217.)

## Indicative Plants.

EDITORS PRESS:—In late numbers of the MINING AND SCIENTIFIC PRESS I have read several interesting articles concerning plants as indicators of minerals.

Here in Northern Arizona I have never been able to discover any plant by which mineral-bearing veins or deposits could be traced, and I think as an aid to prospectors this method must always be a very limited one. It is a well-established fact that almost every plant either grows on the north or south side of a mountain, in wet or dry soil, either rocky or loamy, sandy or clayey; besides, most every plant if left to its own choice has certain altitudes and climates to grow in.

Here in Arizona I have noticed on several places, especially on Groom creek, 10 miles south from Prescott, that I could trace mineral-bearing quartz veins for several miles by the willows, wild grapevines and ferns, and a certain pea or bean-bearing plant, but in these instances it was on account of the water in these veins and not on account of the mineral contained in them. This, I think, is a valuable hint to miners and millmen working where water is scarce. Always sink down on some large quartz vein (mineralized or not), and, if possible, running at right angles to the slope of the country, if there is any water to be found; but if you sink for water in the adjoining formation, granite, slate, porphyry, etc., the deeper you sink the less you are apt to strike any water veins.

I enclosed I send you a small sprig from a shrub growing here in Arizona, which is always a sure indication that lime rock in some form can be found. I have never found this shrub above an altitude of 5500 feet. Another beautiful evergreen shrub grows on the same places, but at still lower altitudes, only where lime rock can be found; they call it greasewood. The Mexicans call the other shrub *caojatia*, which in English means "red shrub." This name is very appropriate. The shrub is an evergreen and never shows any more sign of leaves than the specimens I inclose to you. The flowers and seeds also must be almost invisible, as I was never able to see either. The shrub grows from one to four feet high.

The Mexicans claim some valuable medicinal properties for this shrub. Taken as a tea it works on the kidneys, and is in taste a very close imitation to an inferior quality of Chinese tea. D. H.

Prescott, A. T.

## Copperopolis District, Calaveras Co.

EDITORS PRESS:—This district has always been considered a copper-bearing section only. Driving from Copperopolis to Salt Spring valley, over the road that crosses Bear mountain, I was surprised to find a group of gold mines. While gold mines are common in Calaveras, these were uncommon in being located so low in the plains, and also in their size and character. The ledge is of quartz, almost flat, and of an average width of eight feet. On the vein are the Sunrise, Mammoth, New Era, Royal, Good Enough and Emma, all fall locations. On the New Era, Mr. Carter has a Huntington mill in operation, while the Pine Log Co., who own the Royal, Good Enough, and Emma locations, have a ten-stamp mill erected on their property. The Pine Log Co. has been running for seven years, milling rock of an average value of \$12 to the ton. From the Good Enough two lots have been run, No. 1 of 300 tons, giving an average of \$6.20 to the ton, lot No. 2 of 100 tons yielding \$12.37 to the ton. At the time of my calling, Mr. Tryall, owner of the Sunrise, was milling rock at Mr. Carter's mill, and although laboring under disadvantages, in having to have his rock hauled by wagons to the mine, was proving the value of these mines in showing how cheaply, even under his adverse circumstances, where everything save his own labor had to be hired, the ore from these mines can be worked. Of a 20-ton lot, just crushed, his expenses were:

For milling 20 tons @ 37½¢ a ton	\$ 7 50
For all other expenses \$1.00 a ton	35 00—\$45 50
Returns in gold	70 35

Profit in working 20 tons..... \$24 85

This 20 tons was taken out by Mr. Tryall himself in three days making his wages \$8.28 a day in addition to \$2.50 a day charged in mining expenses. Mr. Tryall has thousands of tons in sight. A stream of water averaging 15 inches crosses the mine. In these days of cheap milling, when dividends are pouring out of low-grade ore, like the Homestake by reason of the large body of ore, it is passing strange that this group of mines, located within a half day's drive of Milton on the Stockton & Copperopolis railroad, should rest here comparatively idle for want of proper milling facilities. What is wanted, and all that is wanted, to make these mines prove profitable is an 80-stamp mill. The ore is here in unlimited quantity. It is easily mined and milled, and the nearness to the railroad and the otherwise favorable features make it a fine opening for capitalists seeking large bodies of free-gold bearing rock. It is well worth a visit of inspection, and the strong vein cropping all along the hillside with its eight feet of vein matter carrying an even amount of

very free milling gold throughout, must impress the examiner with this great promise it holds forth; with free water for milling, wood for fuel at \$3 a cord, labor \$2.50 a day, and but 12 miles distant from the railroad at Milton, there is nothing more to be desired in facilities for cheaply milling this rock. E. H. SCHAEFFLE.

Murphy.

## How the Air-Brake Works.

EDITORS PRESS:—The appressed clipping, credited to the Chicago Journal, is rich enough to reprint, although it scarcely needs comment: "I'll bet not one in a hundred of the people who travel on railway trains understands how the pressure of air is used to apply the brakes to a train. When the air-brake was first invented the air was turned into the cylinder under each car when the car was to be stopped, and the pressure was exerted to force the brakes up against the wheels. But at the present day the brakes are held against the wheels by springs, and the air is turned into the cylinders to push the brakes away from the wheels as long as the train is in motion. When it is desired to stop the train the air is let out, and then the springs apply the brakes and stop the train. This last method of using air pressure has great advantages over the old way on the score of safety.

"Whenever an accident happens to a train one of the first effects it is apt to have is to rupture the air pipes leading from the engine to the cylinders under the cars, and that of itself stops the train instantly. It is very important for everybody to understand this matter, because a child five years old can stop a train in 30 seconds from any car in the train if he simply understands how. You will see, if you look for it, that there is a sort of rope projecting from the toilet-room of every car. That connects with the air pipes under the train. If you catch hold of it and give it a little jerk it will stop the train before it has gone 200 yards."

Several questions arise: Did the "railway man" include himself in the "hundred" ignorant travelers? If not, why not? Was he a "railway man"? If so, should he remain in the business? Does he not know too much for the safety of the ignorant travelers? How many who have read this much-copied article are saying: "Well, I never quite understood the air-brake until now." How much better off are they than they were? F. A. ROSS.

Amazon, M. T.

## Natural Gas in San Mateo County.

The San Mateo Times and Gazette says: Natural gas was discovered in San Mateo county somewhat over a year ago. An engineer named Bodwell was boring for oil on Tunitas creek on the south side of the hills about nine miles distant from the point on S. L. Jones' place where boring is now in progress. He found a good well and enough gas to run his engine for the remainder of the time he continued boring for more oil. Some time after a seven-inch pipe was inserted in a spring on S. L. Jones' place near Woodside. The water from this spring was very strong of iron, sulphur and other minerals. A thin film of oil was noticed on the surface of the water, and in various other places in the vicinity and from the well appeared bubbles which were originally thought to be carbonic acid gas, but later were known to be combustible—a match being applied to the bubbles they ignited. Work on the spring was pushed, and a depth of 100 feet was reached, previous to which there was a decided increase in the quantity of gas and a deposit of bituminous shale was struck. A small quantity of gas being stored in a gasometer it burned with an intensity much greater than ordinary coal gas, and was found to have neither odor nor color. As the quantity found was not sufficient to be of use, Mr. Jones contracted to have another well bored alongside of the old one, which could not be developed further, as it had not been run straight. A 10-inch pipe will be used, and boring will be done with a steam engine. A positive contract has been made with two contingent additional contracts for 250 feet each. Mr. Jones has been in correspondence with gas-well contractors East, and if the present plan does not meet with success, which he has no reason to doubt, he contemplates further efforts with the improved machinery used in the natural gas districts in the East. In a letter to the writer last month, after referring to his intentions regarding the work of boring for gas as given above, he concludes: "There is a continual flow of gas from the well which burns very freely, and we have what are considered good prospects; whether realized or not, time and work only can tell."

At Monte Vista (the Ham ranch) bituminous shale has been found, which, when placed in the fire, burned a blue flame. The same formation of rock and conditions exist here as on the Jones place, and it is very probable that natural gas could be found by boring.

On the McCarthy ranch near Woodside, during the past month natural gas has been discovered, and Mr. Thomas Price, the well-known chemist of San Francisco, has upon examination pronounced it to be of superior quality. Mr. McCarthy is about to begin boring.

Should gas be found in this county in quantities sufficient to be of commercial value, it will be of incalculable benefit to the whole county.

## Some Geological Theories.

Source of Auriferous Quartz and Gravel.

EDITORS PRESS:—Some 25 years since it was my fortune to promulgate, through the columns of your valuable journal, a new theory, when considered in its entirety, relating to the origin and method of the introduction of the precious metals into the earth's crust, under the title of "The Igneous Rocks—Their Relation to the Aqueous Rocks and to the Vein Formations," which was illustrated by a diagram similar to the one accompanying this paper. I have copyrighted this title. The theory, as then presented, was based on the supposition that the earth is a burnt-out sun, and that while the rock matter of which it is composed from its surface to its center was in a fluid state from the high temperatures which then prevailed, it was arranged according to its specific gravity, subject, however, to such modifications as attend an elevated temperature. As the metals expand more rapidly by an increase of temperature than do the rocks, there must have been a time, when, if the temperature was sufficiently high, the metals floated near the earth's original surface, and as the process of cooling went on, the noble metals were brought to the surface by volcanic and seismic action.

## The Past History of the Earth

Is recorded in the composition and structure of the solid crust; the successive strata of the aqueous rocks are largely made up of the kind of rock that was being erupted during the period of its deposition. Thus, gneiss is simply altered granite, unmixed with any other kind of rock-matter, while an aqueous deposit of the present age may be made up of the detritus of all the earlier aqueous formations and the debris of the later volcanic rocks, such as the amygdaloidal and basaltic lavas. At first the granitic stratum was exposed to the decomposing action of water and a highly heated atmosphere, and the gneiss system must be co-extensive with the granitic substratum upon which it rests, or rested. After the first solid crust had formed, only such rock-matter as was brought to the surface by volcanic action could be subjected to the disintegrating agencies; hence with each successive geological age the volcanic rock had a less marked effect in giving a distinctive character to the aqueous formations. Yet the flow of each of the distinctive lavas was sufficient in quantity to unmistakably mark each of the stratified rocks up to and including the old red sandstone.

In the accompanying diagram the double line marks the division between aqueous rocks that were deposited by water at ordinary temperatures and the igneous rocks, which have not been subjected to the action of water. The formations above the double line are made up of such rock material as was brought to the surface through the successive geological ages. The perpendicular lines are intended to represent the eruptive era of each of the distinctive volcanic rocks from the points below the double line to points above where volcanoes are represented, thus presenting to the eye the relation of the igneous strata below to the aqueous strata above. The diverging lines are intended to represent the distinctive kinds of intrusive or vein rock, which appear intersecting the aqueous formations, and the igneous strata from which they were successively derived.

So far as my observation goes, unaltered granite appears at the surface only as vein rock, and it remained the intrusive rock all through the period of the folding of the slates, three well-marked geological ages. It was not possible for the schistose rocks to have been tilted, or folded up to a vertical position, over wide areas, and so generally to a high angle, unless they had rested upon a plastic granitic substratum.

During the period of the folding of the slates, the inequalities of the earth's surface could not have exceeded that presented by long, low ridges and corresponding depressions, but when the granitic substratum had solidified from loss of heat, the era of mountain building was inaugurated, and by a process of corrugation the incipient mountain chains became more elevated and extended.

The old red sandstone is the earliest formation to rest unconformably upon the upturned slates, and it received its distinctive character from the vast quantities of metalliferous quartz which must have been erupted from volcanoes during the period of its deposition. What are termed the ancient river

## Auriferous Gravel Deposits

Always rest immediately upon the upturned slates, and I know of no exception. And this is not all. Certain formations of granulated auriferous quartz, which present every indication of being beach deposits, having evidently never been moved by running water, also are found to rest immediately upon the upturned slates. Reference is particularly made to the vast deposit of granulated quartz at Cherokee, Butte county, California. This deposit covers many square miles, varying from a few feet in thickness to 600 feet in depth, and consists entirely of granulated quartz unmixed with any other kind of rock matter, and in which not even a pebble of country rock appears. The free gold it contains is not in strata, but it is uniformly mixed through the whole mass from the surface down to the bedrock. If this huge mass of granulated quartz had been transported by running water from some locality higher up in the mountains, the gold it contains would

have been in strata, and the deposit would also have contained some of the bedrock of the country over which it passed in the form of boulders, pebbles and sand. These facts and considerations make it quite evident that this huge mass of auriferous quartz was erupted in place from a now extinct volcano, and was granulated by being brought in contact with water by which it was suddenly cooled. This formation shows evidence of having been erupted into the waters of a lake or of the sea, and presents evidence of having been subjected in some of its parts to the action of waves upon a beach, especially in an overlying conglomerate of what appears to have been volcanic ashes with boulders, pebbles, bits of wood, leaves, and the cast of a tree with its branches, which appears in a perpendicular wall of the formation. No other proposition can be entertained in view of these facts, than that this huge mass of granulated quartz was erupted in place from a volcano long extinct. This proposition is conclusively proved by the

## Uncovering of a Crater

By the hydraulic miners, which remains in as good state of preservation as if it had been recently formed. This crater is located at the head of Mesilla valley, within sight of the Cherokee hydraulic mines in Butte county, California. The formation where the crater occurs is what is usually termed slate bedrock. Its trend is about 15° west of north, and east of south, and its dip is nearly vertical. It occurs on the western slopes of one of the long low ridges formed during the period of the folding of the slates. In places where the bedrock has been exposed to the disintegrating agencies, spurs three or four feet in height are seen. The bedrock where the crater occurs was covered by a deposit of granulated quartz varying from a few feet to more than 50 feet in depth, which was removed in the process of mining, and immediately over the crater it might have been, I should judge, perhaps 20 feet in depth. The two openings or howls of the crater were filled with granulated quartz, unmixed with any other kind of rock or recent lavas. There is no body or stratum of the recent lavas, either basaltic or amygdaloidal, nearer than about two miles.

The walls of the crater are as compact as slag and are of about the same color, and there the similarity ends, for the metamorphosis by heat did not proceed so far as to effect the schistose structure which is still preserved. A mass of quartz remains intact in the walls of the crater, which must have been deposited from a solution held in the tepid waters of the second geological age. Such deposits of non-metalliferous quartz are not uncommon in the upturned mica schists. I remember seeing one on the coast of Maine more than two feet in width, which had been prospected with the vain expectation that it might contain gold.

Can the date of this crater be traced to any particular geological age? In my mind there is no doubt of it, as every fact points to the old red sandstone as the period of its formation. It must appear self-evident that it was formed at a period more recent than that of the folding of the slates in which it occurs. It is equally certain that it is of more ancient date than the eruptive era of either the basaltic or amygdaloidal lavas. Had any of the recent lavas been erupted from this extinct volcano, owing to their yielding so slowly to disintegrating agencies, a stream of such lava would have remained in place in contact with the crater, which would have flowed from it down the western declivity. A few miles away in a southerly direction, the table mountains are capped by a basaltic lava. Underneath this cap is a stratum of amygdaloidal lava, which overlies a lithoidal deposit, which appears to have been made up largely of volcanic ashes. This last-named deposit rests immediately upon the huge masses of granulated auriferous quartz, which has been perforated by drifts, by the miners, in the expectation of finding the gold concentrated in river channels. But they found no evidence that the huge mass of quartz has ever been moved by running water. The topography of the country precludes the possibility of there having been any connection between the lavas which cap the table mountains and the crater under consideration. The lava of the table mountains flowed in a westerly direction and must have been vomited forth from other craters, while if any of the recent lavas had any connection with the uncovered crater, the flow would also have been in a westerly direction; but no such lava-flow exists.

Further proof fixing the date of the

## Eruptive Era of Metalliferous Quartz

To the Old Red Sandstone period, appears in the fact recorded by geologists that amygdaloid is the oldest or first form of lava that is found interstratified with the formations in an unaltered condition, and that it first occurs in the deposits of the carboniferous period. Amygdaloid of volcanic origin is found overlying the huge bodies of partially decomposed quartz exactly similar in formation to that now being worked by the hydraulic process in the Cherokee mine, and to that which once covered the crater under consideration.

Still further evidence fixing the date of the eruptive era of metalliferous quartz appears in a vein of coal in the northern continuation of the same deposit that once covered the crater above described. In the face of the perpendicular wall of granulated quartz, about 50 feet above the slate bedrock and 20 feet below the highest point of the quartz deposit, there is a vein of coal. By its disintegration on exposure to the

atmosphere, slack was formed sufficient in quantity to cause spontaneous combustion; and the coal stratum continued to burn until the ground was filled with water by a heavy rain, when the fire was quenched.

As there is now no missing link in the chain of testimony upon which to base a reasonable doubt, that there was a period in the past history of the earth when metalliferous quartz was erupted from volcanoes, and that it occurred during the Old Red Sandstone era, seems an established fact. No other proposition can be entertained when considered in connection with broad, self-evident truth, that after the first solid crust had been formed all the rock matter that enters into the structure of the later stratified formations must have been brought to the surface by volcanic and seismic action. Now in relation to the

#### Vein Formations

And the order of their occurrence. In the State of Maine I have observed veins of granite containing plates of unbroken mica traversing a formation of gneiss. I have also observed granitic veins traversing the mica schists and the porphyritic slates. At the town of St. George on the coast of Maine, I observed a well-defined vein of granite suitable for building purposes, and about two feet in thickness at tide-water, running at right angles directly across the upturned porphyritic schists. The granitic veins are as distinctly marked on the Atlantic Coast as they are on the Pacific Coast.

In the Sierra Nevada of California well-marked granitic veins occur in the greenstone schists and other talcose slates. The granitic veins generally conform with the trend and cleavage of the upturned slates, but in some instances where the slates are at a low angle the vein rock comes up through to the surface directly, irrespective of the natural cleavage, and occupies a position more nearly vertical. Nothing can appear more certain to one who uses his eyes than that granitic rock was intruded to fill fissures caused by upheavals all through the first three geological ages, and through the entire period of the folding of the slates. Such being the fact, porphyry, the eruptive rock of the second geological age, should be the intrusive rock of the fourth or old red sandstone era. And such is the fact, for I have observed veins of porphyry of varying thickness from a few inches to more than 40 feet in width, in formations belonging to the old red sandstone era, but they never occur in a more recent formation. The magnesian rocks should have been the intrusive rock matter of the fifth geological age or carboniferous era. Although many veins of soapstone have fallen under my observation, no such vein traversing a deposit of the carboniferous era has existed to my knowledge.

#### Metalliferous Quartz.

According to the order of occurrence indicated by the diagram, should have been the intrusive or vein rock of the sixth geological age, or grand division in the earth's past history. That there were two periods wide apart, during which the metals were brought to the surface by volcanic and seismic actions, must appear quite evident to the intelligent observer. In the canyon formed by the Yuba river, a few miles east of Strawberry valley, Yuba county, Cal., is a copper-stained quartz vein which presents unmistakable evidence of having been formed at a period so recent that the topography must have been quite the same at the time of its intrusion as it is to-day. It follows the trend of the slates diagonally across the river and up the steep sides of the canyon. On observing the vein, my first thought was, that inasmuch as the ancient river nuriferous gravel beds are situated on the highest ridges of the country above, and that the Yuba river cut diagonally across these ancient river channels hundreds of feet to the bedrock and then furrowed a channel across the western slope of the Sierra Nevada, which in the locality named is not far from being 2000 feet deep in the hard bedrock of the country, and the immense period of time that must have been involved in effecting such great change in the topography of the country, that the metalliferous quartz zone in the igneous section of the earth's crust must be very much wider than I had hitherto supposed. Up to this time I had entertained the idea that the eruption and intrusion of metalliferous quartz to fill fissures caused by upheavals occurred in the same geological age or period in the earth's past history. Upon reflection, the presence of a recently formed quartz vein in such a locality led me to suspect that such a proposition must be abandoned. In casting about, at this particular juncture, it occurred to my mind that I had observed well-marked veins of granite in the upturned slates in a vertical position, and evidently granite continued to be brought to the surface by seismic action long after its eruptive era had passed. Here, then, is the clue which may lead to the true solution of the problem. This led to the question of how high up in the series do granitic veins occur, or through how many geological ages did granite continue to be brought to the surface to fill fissures formed by upheavals.

After much reading of works on geology, and of study, which involved the chemical composition, color and texture of the schistose formation, I determined that granite was the intrusive rock through three geological ages, and that it ceased to be brought to the surface by seismic action with the close of the period of the folding of the slates. Here, then, was the basis for the construction of the accompanying

diagram, representing the plan of the structure of the earth's crust, and the relation of the aqueous to the igneous rock strata of which it is composed.

While there is abundant proof that veins of metalliferous quartz were formed during recent geological time, there is no evidence that it is the intrusive rock of the present period. The discovery of a vein of amygdaloid would present evidence that the quartz stratum had become solid from loss of heat and the period of its intrusion to fill fissures had ended. Inasmuch as amygdaloid is the oldest lava that is found overlying the ancient auriferous quartz gravel deposits, according to the plan presented by the diagram, it should be the intrusive rock of the present geological age, and the existence of a well-marked vein having its lithoidal characteristics should be regarded as the keystone in the arch of testimony supporting the theory the diagram is intended to illustrate. Entertaining such thoughts, I looked for 10 years for such a phenomenon, and was rewarded by finding a well-marked vein of amygdaloid presenting all the peculiarities of structure pertaining to veins of granite, metalliferous quartz or other veins formed by seismic agencies. The

DIFFERENT GEOLOGICAL PERIODS.

vein occurs in altered porphyry, is about 20 feet in width, and where it is cut for the road-head of the C. P. R. R. it carries what miners term a "horse" of porphyry four or five feet in thickness. This vein is located about one mile west of the Truckee hotel in the town of Truckee, California, and although 15 years have since elapsed, such veins are so infrequent that it is the only vein of amygdaloid that has fallen under my observation.

The protrusions of dark-colored rock that were formed at points where volcanic light appeared about six hours of the first shock of the great earthquake that occurred in Inyo county, California, in 1870, might prove, upon examination, to be amygdaloid. There should also be a vein and protrusion of amygdaloid in the mountains east of Iriquoipa, South America, that were formed where volcanic light appeared, turning night into day, during the great earthquake and tidal wave that occurred at that place some years since.

To my mind one well-marked vein of amygdaloid, bearing unmistakable evidence that it was formed by seismic agencies, is sufficient to indicate that we are now on the seventh geological age, and it gives assurance that others will be found which were formed during the occurrence of recent earthquakes, and also that still others may be observed and studied while in process of formation in the future.

Since writing the above I have been informed of an additional fact that there is a quartz lode carrying silver-bearing galena, cutting across the coal strata and up through the surface. The formation above the coal is sandstone. It is located three to four miles north of Crested

Buttes, Gunnison county, Colorado. My informant is Mr. Jno. B. Wilford, 3330 Lawrence street, Denver, Colorado. He refers me to the Anthracite Coal Co., Crested Buttes, Colorado, for further information.

#### Professor Egleston in the New York Circus.

EDITORS PRESS:—While waiting for the editor, I sat down in his cozy nest, stuffed two feet high with newspaper clippings, and soon dozed off. I dreamt I was the Louisiana orphan boy inside of the wheel whence the lottery tickets are drawn. Being within reach of what would make me happy for the rest of my days, I stretched out my hand and awoke. I found that I had caught a piece of the New York *Financial and Mining Record* of Nov. 5, 1887, containing a criticism on Professor Egleston's new book on the "Metallurgy of Silver, Gold and Mercury in the United States." Disappointed I was, still I read the essay. It was signed with a name which I had seen before,

and the reading public has enjoyed the personalities. Of course, one does not remember all the names on the playbill, still, by using the mnemotechnical style of Silas Wegg, I remember the metallurgist who signed the critic of Prof. Egleston's metallurgy as the gentleman with the many initials.

When that gentleman sat down to write his critic of Prof. Egleston's book, he evidently was going to have a square meal on it. The pen had been put to the grindstone and the inkstand freshly filled with extract of gall. Only, when the pen is so very sharp, it does not take up much of that fluid at one time. So the writer opened the feast with prayers from "Erasmus, Luther's cotemporary," translated from Goethe's Faust, several dreadful warnings to professors in general as a kind of appetizer, and commenced the menu with the professor's preface. That saved the unhappy author—at least a piece of him. There was so much substance in that soup, and Erasmus and Goethe had taken so much valuable paper, that the *Financial Record* being also an economical one could only afford just enough room for an onslaught on the professor's punctuation, a sweeping blessing on the rest and for the initials.

Meanwhile the editor came in and showed me the book which I had just seen getting eaten up as if it was a subject in disgrace of King Mtesa of Uganda. The editor that I was talking to said he had not yet reviewed it because they had run it down so dreadfully. This "they" included another New York mining paper where another member of the Circus had taken powerful bites. Having dabbled, myself, in my own small way, a little in metallurgy, I became curious to discover where, why and how the author had offended the Circus, asked permission and took the book home.

In the preface the author thanks 37 different parties for information furnished, and among San Francisco people Mr. Scott of the Union Iron Works and the managers of the Miners' Foundry, "who kindly allowed me to take tracings of drawings and to examine the mills which they have constructed." "Who ever," fairly scream the initials, "has seen a learned author thank the manufacturers and vendors of machinery for imparting information concerning the ware they deal in?" This is courtesy bordering on vulgarity, if not even worse than this. Prof. Egleston in his preface thus advertises not less than five machine shops. Now, there is virtue with a vengeance! We have to go back to the Holy Origins to find the like. To add how much I was shocked myself would be only painting the lily and would appear as if I wanted to share the odor of sanctity of the virtuous critic of the *Financial Record*.

Still I must confess that I, who have yet to improve, can learn much from Prof. Egleston's book. The present methods of American practices are fully and honestly treated. I thought first the professor had committed a certain great crime, but I was mistaken. The composition of Mr. Alterego's "Extra Solution," which is dispensed at the Circus as a free drink, is quite seriously given and taken. For those of the readers who, in a patriotic way, are fond of new American drinks, I state that to act really beneficially on the chemical constitution of the ore body it is to be taken with Prof. Self's roasting oven and several other patents, to be had at the Circus at reasonable rates.

But to accommodate customers, Mr. Alterego's extra solution will be sold also in separate bottles, although, of course, at an advanced figure. No bottle sold without Prof. Self's fore and aft testimonials. Mind the trademark: A shuttlecock with the signature of the hatterdors. There is in Prof. Egleston's book less wit and grit than in Dr. Percy's Metallurgy, but the doctor is an established authority in England for 30 years and may indulge in a little mirth occasionally. If he lived in New York and got a pull in the Circus 52 times a year, not to mention any odd Christmas number, he and his good humor would soon part company, a thing which we should much regret for his sake and for our own. There is also a dearth in chemical formulas noticeable, but herein the professor acted wisely. Just throw a handful of such formulas into the Circus! Scrambling for them as for peanuts? No, sir; you can only compare it to a football thrown among a dozen sophomores at recess-time. Mrs. Eris' golden apple is a favor at a German in comparison. There are many other omissions and commissions in the book; for instance, to forget the important work at some mill somewhere done by a gentleman connected with the Circus, or to describe a process annihilated by another gentleman of the same institution. I admire the courage of Prof. Egleston in praising Bruckner's rotary roaster with poor Bruckner and his patent dead and gone, and the other patent roasters still alive and kicking. I have no doubt that there are many errors in the professor's book, but a few bad men claim to have found some even in the Bible. Unfortunately, the positive metallurgy writes no books, but only correspondences and pamphlets on its own patented revolutions of science with new editions for important evolutions of those revolutions since discovered. Thus we have to be pleased with what we can get. It is true a person in metallurgical trouble may write to New York to get at the truth of things. He merely has to state his sore case in the Circus and to send a confession of his low mental condition and of his impecuniosity. The first confession will be accepted readily, the other one not without an affidavit.

## TABLE OF CONTENTS.

EDITORIALS.—Land Reclamation, 218. Passing Events; Petroleum Fuel; The White Metal in the Ascendant; The Alaska Catamount Let Loose in New York, 215. Land Reclamation; Speed's Electric Railway, 217.

ILLUSTRATIONS.—Reclamation Pumping Plant, 218-217. Different Geological Periods, 215.

CORRESPONDENCE.—Indicative Plants; Copperopolis District, Calaveras County; How the Air-Brake Works; Some Geological Theories, 214. Professor Egleston in the New York Circus, 215.

MECHANICAL PROGRESS.—Recent Advances in the Iron Industry; Give the Belts Rest; Resistance in the Tube Plates of Boiler Tubes with Taper Ends; Castor Oil to Prevent Foaming; A Boiler Illuminated by Electricity; Heat, not Blaze; Carving Machines, 218.

SCIENTIFIC PROGRESS.—Diamonds and Emeralds; Interesting Facts in Regard to Coal; Vegetable and Mineral Coloring; The Coal-Tar Sugar; Coffee as a Germicide; Moonlight Effects on Vegetables; Another New Explosive; Electric Aluminum; A New Silver Alloy, 218.

GOOD HEALTH.—The Desire to Attain Old Age; Study and Hygiene; Color Blindness a Brain Affection; Hope for Consumptives, 219.

USEFUL INFORMATION.—To Fill Cracks of Furniture; To Destroy Certain Tastes; Varieties of Cider; Use of Sawmill Refuse; Green and Dry Lumber; Crimson-Stained Wood; Electro-Deposited Steam Pipes; Night and Day Growth, 219.

ENGINEERING NOTES.—Rapid Extension of Cable Roads; Connecting the Mississippi with the Lakes; Another Stupendous Engineering Scheme; A Steamer with a Propeller Fore and Aft; The Proposed English Channel Bridge; Connecting Lakes Erie and Michigan, 219.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 220-1.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 224.

## Business Announcements.

## Passing Events.

They are having quite an excitement over gold discoveries on the Provo river, Utah. A number of locations have been made, all in quartz. The local papers do not seem to think much of this region and place little faith in the reports of assays.

Great interest is being taken in the mining counties on the subject of the Biggs hill now before Congress, which provides that a proper investigation of the hydraulic mining question shall be made by disinterested Government engineers. There is, of course, much opposition from the valley counties, where they object to the reopening of the discussion. A thorough, impartial investigation would be beneficial to all concerned.

The operations of the French copper syndicate have had the effect of increasing the value of copper properties in this country, as the mines are assured of good prices for some time to come. "Copper stocks" are now booming.

The people of Lake county are rejoiced over the fact that they are at last to have a railroad, the arrangements having finally been completed. El Dorado county, too, feels elated now that the rails have been extended to Placerville.

A great deal of attention is now being turned to the tin mines of the Black Hills, Dakota. Some good solid development work ought very shortly to prove the value of the deposits.

## Petroleum Fuel.

The verdict of the coroner's jury in the Julia disaster (which is printed in another column) and the action of the Insurance Union in raising rates will probably, for the present at least, stop the rapid increase in the use of petroleum for fuel in making steam. In the MINING AND SCIENTIFIC PRESS a few months since we gave an account of the discussion between the Insurance Union and the Supervisors concerning the use of this fuel. The Insurance Union insists on a 90-degree fire test, and the Supervisors are satisfied with one of 80 degrees. A number of permits have been granted by the Supervisors for use of this fuel in the city, but the Insurance Union has adopted certain rules of its own. It will not permit petroleum to be used for the generation of steam in any building within 60 feet of any other building; an additional rate of one-fourth of one per cent is charged; the petroleum must stand a temperature of at least 90 degrees before emitting an inflammable vapor; the iron storage tank must not hold over 1000 gallons; there shall be only one at each place, and it must be two feet underground outside of all buildings; the supply tank must not hold more than 110 gallons, must be connected with the storage tank by a pipe, so that every evening the supply-tank oil must be run back into the storage tank; that the Fire Warden and Fire Marshal may at any time go to the storage tank and test the oil; two steam pipes shall be placed, one connecting the boiler with the supply tank, and the other one connecting the boiler with the storage tank, and that each of such steam pipes shall be provided with a shut-off cock, so arranged that steam can be readily directed into both (or either of) such tanks, through said pipes, or either of them.

It is pretty certain that even under these restrictions by the Insurance Union, oil-fuel has "come to stay." Some manufacturers testify to a saving of 70 per cent in fuel bills at present prices of coal. Even with coal at normal rates, considerable saving is effected both in cost and handling of the fuel. The production of this fuel in California is now about 1500 barrels a day, and 5000 barrels is a limit that will not be reached for some time. The oilmen say that three barrels of oil are equal in heat-producing power to a ton of coal. Oil costs \$1.50 a barrel. That is \$4.50 for fuel that in the form of coal costs from \$5 to \$8 ordinarily and \$17 occasionally. The oil sold for fuel is 80 degrees test. If the lighter products are taken from California oil, the residuum is so thick that it is difficult to move it in pipes. It is claimed by the oilmen that oil is perfectly safe if used properly, and the manufacturers and foundrymen who use it are satisfied as to its safety. The iron drums of oil in the late fire at the Fulton works were not destroyed, and the oil was found intact after the fire.

The difference between the oilmen and the insurance men will, no doubt, be reconciled in time. The former insist that an 80-degree fire test is sufficient, and the latter want it placed at 90 degrees. The insurance men also want some guarantee that the oil furnished manufacturers will be of the prescribed character. They say at present there is none; that any kind of oil is furnished and no one tests it. The dispute has been going on for some months now. The supervisors are issuing permits to use and store 80-degree oil, and the insurance men refuse to insure unless it reaches 90 degrees, and then make an extra charge when it is used.

As to its use on ferryboats, we have given in this paper the details of the results of trials for efficiency and economy. The coroner's jury in the Julia disaster now condemn its use on steamers, and say it should be prohibited by law. But there is a difference of opinion in this also. The oil-tanks on the Julia were found full of oil after the explosion and fire, though it was at first thought the oil had exploded. No oil did explode. Still there was a fire after the explosion, and this was laid to the oil; hence the verdict. In view of the opinion, the Southern Pacific Co. have discontinued the use of petroleum for fuel on the Oakland ferryboats. It would be unwise for them to continue it, since, in case of an accident, after the verdict of the jury referred to, they would probably be liable to very heavy damages.

The manufacturers in this city who are using the oil fuel, and who wish to continue, are in hopes the differences will be settled, and that some satisfactory solution to the whole problem will be found. They do not wish to have anything unsatisfactory about any more than the insurance men do. But they do want a cheap fuel, such as this is.

## The White Metal in the Ascendant.

An Act having been passed by Congress in 1882 authorizing the Secretary of the Treasury to purchase United States bonds with the surplus that had accumulated in the National Treasury, that official has since bought up these securities to a large amount. This law of 1882, by reason of its having been attached to the general appropriation bill of that year, having caused some to question its validity, a new bill of the same purport was recently passed by the House and sent to the Senate, where it was favorably reported on by the Committee on Finance. The retirement of these bonds has forced the National banks to largely contract their circulation, these bonds being the basis on which they issue their notes. This contraction has already reduced the circulating medium of the country to the extent of sixty millions or more, an amount that must, of course, be steadily augmented in the future.

With a view to making good this deficiency and restoring the circulating medium of the country to its normal condition, Senator Stewart of Nevada, when the above bill came to be considered in the Senate, offered an amendment which provides that the owners of gold and silver bullion may deposit the same in the mints and assay offices of the United States, and receive certificates therefor, which certificates are redeemable by the Government, and are to be a legal tender for all dues.

This amendment was vigorously opposed by the monometallists in the Senate, who, being unable to defeat, had recourse to various expedients to postpone action upon it, seeking meantime to substitute in its stead other measures less objectionable to the bond-holders and the creditor classes generally. At the instance of Senator Plumb of Kansas, the Senate amended the original bill by instructing the Secretary of the Treasury to issue greenbacks in place of the banknotes retired. Senator Beck of Kentucky offered an amendment whereby the Secretary of the Treasury is authorized and directed to purchase at the market price an amount of silver bullion equal to the circulation surrendered by the National banks, the same to be coined into standard silver dollars, this being in addition to the amount of silver bullion that official is authorized to purchase under the present Silver Coinage Act.

On the 4th inst., the Beck amendment to the Bond bill was adopted in the Senate by a vote of 37 to 13, showing that the opinions of that body had undergone a decided change during the discussion had of its merits. Senator Stewart, finding that he could not, in the present temper of the Senate, carry his own amendment, voted for that of Senator Beck. But the Nevada Senator has not abandoned his favorite measure, which it is his intention to bring up again, and urge on the attention of the Senate when conditions seem more favorable. That it can be enacted into a law at the next session of Congress is highly probable, as it has already many warm supporters in both branches of that body.

While the Stewart amendment embodies a broader policy in dealing with the silver question than the amendment introduced by Senator Beck, the adoption of the latter is something gained. It is, in fact, a long stride in the direction of silver restoration in the United States, and which, finally accomplished, must hasten its rehabilitation in other countries.

ACADEMY OF SCIENCES.—At the last meeting of the California Academy of Sciences, 176 volumes of books were received. Rev. P. V. Veeder read an essay on "Progress in Japan." Mr. Veeder was formerly principal of the old City College in this city, succeeding Dr. Burrows. He went to Japan and remained at the University of Tokio for some years. He said that the Japanese University was modeled after the best of American and European colleges, was opened in 1873, and that it is the peer of our own Harvard or Yale.

## The Alaska Catamount Let Loose In New York.

We learn through the editorial columns of the *Engineering and Mining Journal* of New York, that a number of companies have been organized in that and other Eastern cities for operating in the quartz mines of Alaska. A great many shares of these companies have been worked off on the public, who are buying them, it appears, on the representations made by the manipulators and others interested in the promotion of these mining schemes, reference being constantly made by these parties to what has been accomplished in that country by the Treadwell Company. That this company, whose mines and works are located on Douglas island, has an excellent record cannot be denied, and in so far as the claims of these new organizations are situated on the Treadwell vein, their prospects may, as a rule, be considered fairly good. Not that this vein has been proven for any great distance, but because an ore channel of such masterly proportions and traceable by surface indications for several miles will be very likely to contain more than one fruitful spot, and may even contain a good many. But as there is no certainty of this, investors, even in claims known to be on that lode, take some chances when buying in advance of exploration.

But many and perhaps most of the claims belonging to these new incorporations are not, it seems, located on the Treadwell vein, but on lateral and in some cases far distant lodes, a portion of them being on the main land and not on Douglas island at all; a fact that further detracts from their value, inasmuch as none of these outside lodes have been much developed, nor have any considerable working tests of their ores been made. The Treadwell Company is the only one that has made any bullion production in that country; is the only one, in fact, that has yet got a mill in operation. Two or three others have put up mills, but none of them have as yet been started, though one at least was completed some six or eight months ago. Why these mills have not been set at work it is difficult to understand, unless, to be sure, the owners may have thought the plan of selling their shares a surer way for replenishing their treasury than the working of their ores.

That Alaska contains many valuable deposits of gold-bearing quartz, all of which will eventually be opened and worked with profit, admits of no doubt. That large numbers of people will lose heavily through the purchase of mining shares in that region is to our mind equally clear. That our New York contemporaries has good reason for denouncing the manner in which these shares are there being disposed of, we venture to say. That a majority of these Alaska companies belong to the family of the untamed felines is more than probable, and it will be strange indeed if somebody does not get badly scratched by them. If there were but one or two of the creatures at large, the case would not be so bad; but a numerous brood of these young catamounts seems to have been littered in that city, where the credulous and the gullible being many, they find ample prey. We counsel Eastern investors that before buying they carefully inspect this class of "ascutrities," lest by and by, when speaking of their ventures in Alaska, they may feel that they can best give expression to their anguish by omitting the final syllable of that name!

MRS. CONRAD WIEGAND, her granddaughter and her sister, starved to death at Mount Holly, N. J. They were without means of livelihood, and did not tell of their sufferings until too late to be saved. Mrs. Wiegand was the wife of the late Conrad Wiegand, the assayer of Virginia City, who was for years well known all over this coast. He was a learned man and wrote frequently for the MINING AND SCIENTIFIC PRESS and other journals. It appears now that some property at Virginia City belongs to his estate, and that it produces a monthly income, but for some reason Mrs. Wiegand did not receive it promptly. It scarcely seems possible that such a distressing circumstance could occur in this age and in a civilized and settled region.

HEAVY contracts for wood are being made in the Sierras by the Central Pacific, the locomotives having been changed from coal to wood-burning.

## Land Reclamation.

(Continued from page 213.)

of the levee, and there is one 40-inch discharge pipe from each pump passing over the levee and going down an incline to the river. The lowest part of the discharge pipe is always submerged.

The pumps are primed from the jet-condenser, which acts as a condenser for the com-

set the full distance across for collecting floating vines, debris, etc. The grating is set at an angle, the same as the cow-catcher of a locomotive, so as to direct the weeds, etc., off to the sides, and the inclined form tends to make the material rise to the upper portion of the grating. The sump proper is 30 feet wide and 12 feet deep, with bottom and sides perfectly smooth, the mouth expanding like a funnel until it is 50 feet wide, and here the grating or

is discharged under any given circumstances—which can be increased from a minimum of say 10,000 gallons per minute, to a maximum of 60,000 gallons per minute for each of the two large pumps.

This engine has, like all other engines made by the San Francisco Tool Company, received the greatest possible care in its design and workmanship. The working parts are reduced to the fewest number possible without sacrific-

levee are bunkers to hold 400 tons of coal. The floor of the bunkers inclines 30° to the furnaces, and there are sliding doors, so the supply is drawn to each furnace without handling. Schooners which come up the river hoist their cargoes of coal directly into the bunkers. The engine-house building, sleeping-rooms, etc., are artistically and substantially made. They are of rustic exterior with circular windows and other ornamentation. The interior is tastefully finished. The whole plant was made by the San Francisco Tool Company under the supervision of Mr. P. J. Van Lohensele, for the San Francisco Savings Union, and as the largest reclamation plant in the United States, reflects credit on the designers and builders.

## Speed's Electric Railway.

In the application of electricity to railway propulsion there are two systems; let, in parallel, and 2d in series. The first corresponds to the method of incandescence lighting; that is, with the small glow lamps invented by Edison. The second to arc lights, seen on our streets. In the first, whatever current is sent out along the wires is divided, and quite impartially, among all the lamps to be lighted, each one of which receives its exact share, so if there are four lamps each will receive one-fourth. It is evident that the current originally must be very large to permit of division into many small parts and yet furnish enough for each to make it burn brightly. Large currents require correspondingly large conductors, which increase in size very rapidly as the distance increases. For instance, if a given number of lamps at a certain distance from the dynamo requires a conductor of a given sectional area, the same number of lamps twice as far away requires a conductor of twice the sectional area, or four times as heavy. In arc lighting the current which burns the first one from the dynamo passes on to the second, and so on throughout the whole series. The current causing the first one to burn brightly will have the same effect upon each of the others if the electro-motive force or pressure is increased proportionately to the number. The current (measured in amperes, the unit of quantity) in this case is small, and therefore the conductors may be small, and also long, without material loss. The nearest analogy is the flow of water in pipes. If the quantity is large and the pressure small, the pipe must be large. If the quantity is small and the pressure high, the pipe may be small. It is in this that the economy of a series system over the multiple system are most apparent. All of this applies to electro-motors as well as lamps. Electricians are fully aware that the coming successful application of electricity to railways is on the series system. In no other can more than a few cars be simultaneously operated at any distance from the source of power.

The patent obtained through the MINING AND SCIENTIFIC PRESS Patent Agency by F. M. Speed of this city, March 27th, is supplementary to a patent granted to Fleming Jenkin, late professor in Edinburgh University, one of the most noted English authorities upon electrical matters, who, as long ago as 1882, clearly foretold that finally the series system must obtain if the mechanical details could be perfected. Mr. Speed has made an important advance in the electrical administration, so to speak, of the currents to maintain the series relation of the motors and care as they pass along the road, which consists of an improved means for operating the switches, and a peculiar arrangement of the conductors to permit of said switches being operated automatically without interference with the current operating the motors. The patent also covers other details.

At the Plumae-Enreka mine the ore from the 76-cable is run down to the ore station by a wire cable which is 1600 feet long, then hauled half a mile through snowdrifts to the mouth of the Mohawk tunnel, then loaded again on the double-track tramway, sent a distance of 1400 feet to the 60-stamp mill, which has all the modern improvements of the day—three large rock-breakers, 22 concentrators and pans, 12 self-feeders. The machinery is run by a Knight water-wheel.

It is said on the authority of the London Times that the principal American lead dealers have contracted with European firms to sell their output at £16 sterling per ton for three years. This means a continued high price.

FIG. 2.—SIDE ELEVATION OF PUMPING PLANT AT A-B ON THE PLAN.

pound engine and the 12x24 Meyers' cut-off engine, which also forms part of the plant and is shown in the plan. The pumps, on being primed, have the valves left partially open to the condensers, so that any air accumulating is

strainer is placed. This enlargement at the entrance is designed so that even the obstruction at the grating, in case of floating weeds, does not impede the flow of water the full size of the sump proper. As the sump has straight

ing its efficiency, and are thoroughly balanced. The bearing surfaces are of exceptionally large area, and the lubricating arrangements most perfect. The most of the forged parts are of the best hammered steel, and all the materials

FIG. 3.—SIDE ELEVATION OF PUMPING PLANT AT C-D ON THE PLAN.

taken up by the condenser and the siphon action is never impaired in the pumps.

The two 15-inch pumps stand directly over the sump, each having two suction pipes and discharging into one large discharge pipe. They are driven by the 12x24 Meyers' cut-off engine by belt connections. They are now used to drain the land when there is not enough water in the ditches to supply the large pumps.

Fig. 2 is a side elevation of the 12x24 Meyers' cut-off engine and 15-inch pumps, condenser and 30-inch pump, looking from the boilers toward the compound engine.

Fig. 3 is a side elevation of the compound engine and 30-inch pump, also showing angle of the four 28-inch suction pipes.

The sump is arranged in a peculiar manner. The mouth is 50 feet wide, and has a grating

sides and bottom, where the water passes through the straight portion, it is easily measured, and the amount of water pumped readily calculated.

The large engine for the 30-inch pumps is a compound condensing engine, with variable expansion gear—the latter enabling the engineer, without a moment's loss of time, to change the point in the stroke at which the steam is cut off and to modify the speed and power of the engine as the change of lift or quantity of water discharged requires.

The diameter of the fly-wheel is 58 inches, that of the low and high pressure cylinders, 14 inches and 26 inches respectively. The stroke is 18 inches; the number of revolutions is from 130 to 210 per minute, according to the height the water is to be raised or the quantity de-

need in their construction as well as the workmanship are of the best description.

In a test of one of the 30-inch pumps run by the engine, the following results were shown: The total discharge of the pump was 37,907 gallons per minute, lifting water 11 feet 7 inches high, the engine developing 124.8 horsepower nominal, consuming 12,125 pounds of average Sydney coal in a run of 24 hours.

Steam is furnished for this plant by a battery of four boilers, two 48-inch by 16 feet, and two 60-inch by 16 feet. The boilers are arranged so that they may be disconnected at any time. There are two feed-pumps. The pumps are also connected with fire hydrants throughout the buildings, and connected to a tank at an elevation on the building.

In front of the boilers and on top of the

# MECHANICAL PROGRESS.

## Recent Advances in the Iron Industry.

Mr. Laurean of Philadelphia, a most competent authority, says: "No revolutionary progress has been made lately in the metallurgy of iron and steel, but improvements are steadily taking place which tend to decrease the cost of production and increase the output. In this country especially is the development of mechanical appliances noticeable. Improvements in processes are more marked in Europe, where the utilization of inferior iron for the manufacture of steel by the basic process has been made a special study and is still developing, mainly in the open-hearth practice.

"In our country the last two years have witnessed astonishing activity in the construction of new blast furnaces and steel works. Our firm alone constructed ten entirely new blast furnaces (eight of them being in Tennessee and Alabama), remodeled ten more and built six steel works, representing in all an outlay of over \$2,500,000.

"In connection with the construction of blast furnaces the use of fire brick hot-blast stoves used in preheating the blast is becoming more and more prevalent. A cast-iron stove heats the blast to say about 900° F., while a fire-brick stove can furnish up to 1600°. The extra amount of heat introduced in the blast decreases correspondingly the consumption of fuel, so that in well-managed furnaces using good ores the past year has seen the lowest fuel consumption to the ton of iron ever reached in this country, and probably in the world. Published results show that one gross ton of iron has been made with 1850 pounds of coke, and many furnaces show an average record of between 1900 and 2000 pounds of fuel.

"Fire-brick hot-blast stoves have been greatly improved lately. They have been made more manageable, their construction more simple and the first cost lower. Our firm constructs a special form of fire-brick hot-blast stove, combining the Whitwell and Cowper systems with certain valuable improvements patented by our Mr. Fred. W. Gordon.

"The stove is well known now in the United States by the name of the Gordon-Whitwell-Cowper stove. We have built 60 of these stoves in the last two years.

"In the construction of Bessemer plants nothing of importance is noticeable. A great many works of small capacity have been built with both stationary and tilting converters, and more or less ingenuity has been shown in the designs, but the main features remain what Bessemer and Alexander L. Holley made them.

"In the construction of Siemens' regenerative furnaces, important modifications have been adopted. In the usual form the melting chamber, or hearth, is built standing upon the regenerators. In the improved forms the hearth is mounted upon columns and completely separated from the regenerators, which stand in detached pairs at each end of the hearth, as in the Batho-Ruey furnace, or in connected groups of two at each end, as in the very successful furnace built by us at Zanesville. In both these types the melting chamber is round instead of oblong, as usual.

"In the manufacture of steel, nothing very new has come to the surface during the last year. Two establishments have fitted themselves up for using the basic process—one at Pottstown, Pa., the other at Homestead, Pa. The Pottstown establishment uses the Bessemer process, while at Homestead open-hearth furnaces are used. The developments have not gone far enough to announce results.

"Great progress has been made in the manufacture of steel castings. The process under which all successful makers now work was developed at Torrenoire, France, some ten years ago. American manufacturers have applied their usual ingenuity, and now we may say we can produce as good steel castings as Europe. The casting of rolls weighing nearly 50,000 pounds and an anvil block weighing 66,000 pounds at the Ohio Steel Company's, Cleveland, Ohio, and the casting of the experimental nine-ton gun at the Pittsburgh Steel Casting Company's, give an idea of what can be done in large blocks. But for a genuine test of difficult steel-casting practice we will mention the test often accomplished at the Solid Steel Casting Company's, of Alliance, O., of casting 10,000 pounds of steel (the entire charge of one open-hearth furnace) into 120 molds."

**GIVE THE BELTS REST.**—Most shopmen are aware that it is better for belts to relieve the strain upon them whenever they are out of use, and it is a good practice to run belts off from lathe cones and in other places where it can be conveniently done every night when quitting work. Any one who has tried it, and observed its effects, knows that a leather belt so treated pulls better and lasts longer than if kept continually strained up. Of course it is by no means possible to treat all belts in that way, but whenever it is practicable the rule should be observed. A writer in the *Practical Engineer* (Manchester) says an experiment was made as follows: New leather belts, made from the same hides, were put on two engine lathes which stood side by side, and were used upon the same kind of work. One of these was thrown off every night, while the other was never released. The latter had to be shortened four times during its existence, while the other was taken up but once, and was in

good condition when the continuously strained one was worn out. Of course a single experiment of that kind would not definitely settle such a matter, but all experience seems to point the same way.—*American Machinist*.

**RESISTANCE IN TUBE PLATES OF BOILER TUBES WITH TAPER ENDS.**—In the minutes of the proceedings of the British Institution of Civil Engineers, there is an interesting record of some experiments which were made in Germany some time ago, with the object of testing the resistance of boiler tubes with taper ends forced into the tube plates. Five wrought-iron tubes were supplied for the purpose, which were forced into wrought-iron plates, bolted to and closing up the ends of a cast-iron pipe. Each tube was strengthened at both ends by a ring brazed on and turned taper on the outside, so that the outer surfaces of the two rings on each tube formed part of the same cone. The joints were made tight against an internal pressure of 15 atmospheres by means of a tube expander. In the first series of experiments the projecting ends of the tubes were not enlarged; in the second they were. The prepared test-piece was placed in the Werder machine in such a manner that at one end pressure was applied to the cast-iron pipe, at the other to the wrought-iron tube. With ends not enlarged, the mean force required to push out the tubes was 15,211.7 pounds; the maximum, 18,739.1 pounds; with enlarged ends the mean resistance was 20,943.7 pounds, showing an increase of 37 per cent. The outside diameter of the smaller end of the tubes tested was about 3.05 inches; this was measured on the taper ring. The diameter and thickness of the actual tubes themselves are not stated.

**CASTOR OIL TO PREVENT FOAMING.**—A correspondent of the *American Mechanic* writes as follows: "I have been troubled very much with the foaming of the water in boilers, especially when taken from creaks and pools. I have tried many ways to remedy the evil, but all the remedies that I could think of and read of failed me at times; but I have found one of late that has proven the best of all. Several months ago I was having trouble with the water, so much so that I could not run the engine. The foreman of the mill said he had used castor oil in a boiler where alkali water was used, and that he thought this would help us out of the trouble. So I put two ounces of the oil in at the check valve, and in three minutes the water was still and clear. So when foaming began again I began with the oil. Generally two ounces would last a day, but at times I would have to use a pint. My plan of handling boilers is to blow out some of the water at night or morning with about 50 pounds of steam, and put the oil in, if foaming begins after starting the engine. I never blow all the water out of a boiler, when hot, if I can avoid it. This boiler is tubular, 44-inch diameter, 14 feet long, and carries from 100 to 120 pounds of steam. Engine 12x20; 190 revolutions."

**A BOILER ILLUMINATED BY ELECTRICITY.**—At the late London exposition of inventions there was shown a working steam boiler, the interior of which was illuminated by electricity. The whole apparatus used for this purpose consists of a little battery outside of the boiler, which is connected with incandescent lights screwed to the interior walls of the steam space above the water level and encased in steam-tight bulbs, while a second wire ends in a leading button outside of the boiler. Strong, double observing glasses are let into a brass rim set into the end wall of the boiler. If the current is closed by pressing the button against the metallic boiler wall, then the incandescent lamps begin to glow and light the interior of the boiler. It is hoped by this means of observing the process of heating water and the production and withdrawal of steam to gain material knowledge and advantages for steam

**HEAT, NOT BLAZE.**—Heat in contact with the shell or flues of boilers is very rapidly dissipated; for instance, if the extraneous air and the products of combustion in the fire-box is assumed to be 2500° F., and the temperature in the chimney of a 20-foot boiler 600° F., and the rate of motion is taken at 22½ feet a second, and it would follow that in passing under through the boiler is about 1½ seconds, they would have parted with 2500°—600°=1900° of heat; so that it will be readily seen that perfect combustion can take place but little if any distance back of the bridge wall. The assumption of 2500° in the fire-box is a very generous one, comparatively few furnaces showing any such results. But a large majority of those who have charge of steam boilers delight in a long blaze, and claim that such a blaze makes steam rapidly, while really there is no better evidence of imperfect combustion.—*Industrial World*.

**CARVING MACHINES**, each of them capable of doing the work of eight to ten men, have been introduced into the Pullman carshops in Illinois as a consequence of the recent strike, and, as claimed, with success. The machines work from a pattern, previously made by hand, which is placed in the center. A "needle" is made to follow all the curves, etc., of the pattern, and chisels on the end of arms at each side make duplicate of the pattern. These machines, the superintendent says, will largely supersede handwork and at the same time insure uniformity.

# SCIENTIFIC PROGRESS.

## Diamonds and Emery Wheels.

At a meeting of the New York Academy of Sciences, held on April 13, 1885, Mr. George F. Kunz, the gem expert, whose illustrated article on American gems in *Harper's Magazine* for December, 1887, attracted much attention, exhibited and described a remarkable diamond regarding which he had previously published a communication in the number of *Science* for May 30, 1884. This diamond was made up of a multiplicity of twinnings, and was of the character called "extreme dureté" by the French. It had been cut into the rude form of a brilliant, and its table had been placed on a diamond-polishing wheel for 100 days. The average circumference of that part of the wheel on which it was placed being about 2½ feet, and the wheel going at the rate of 2800 revolutions per minute, the surface that traveled over the diamond table amounted to over 75,000 miles. At times four and eight pounds were added to the usual 2½ to 3 pounds of the clamp or holder, and for a time 40 pounds extra were added, this last causing the wheel to throw out scintillations for several feet. The diamond fairly plowed the wheel, practically ruining it, so that it required planing before it could be further used. No polish was produced, however, sufficient to give the brilliancy necessary in any diamond gem. These experiments were conducted by Messrs. Tiffany & Co., who were the owners of the diamond.

The stone thus described was kept by Messrs. Tiffany & Co. as a curiosity in their gem cabinet until November, 1887, when it was bought by the Tanite Co. of Stroudsburg, Monroe county, Pa. The solid emery wheels manufactured by this company are all lathe turned, the turning tools being diamond-pointed. The gem in question was put to work in the turning-room of the above establishment, the first solid emery wheel it turned being a coarse, hard wheel 36 inches in diameter and 8 inches thick. In the turning of this wheel and two much smaller ones, the diamond lost 1.32 carat in weight. In the manufacture of Tanite emery wheels the cost of diamonds is an important factor, and it is a striking fact that a gem of such extreme hardness as is indicated by Messrs. Tiffany & Co.'s experiments should wear so rapidly under the action of a Tanite wheel.—*Stroudsburg (Pa.) Jeffersonian*.

## Interesting Facts in Regard to Coal.

In the course of a lecture given at Toynbee Hall, a charitable institution founded for the benefit of the poor inhabitants of the "East End" of London, Prof. Boyd Dawkins, speaking of a "bit of coal," said that, besides the element of carbon, coal had another important constituent in the form of a resinous substance visible in shining patches on any cross-section. To this element, which was composed of the spores of plants allied in nature to the club-mosses of the present day, were due all the blezing properties of the coal; and the extra quantity of gas existing in cannel coal was due to the fact that it possessed a greater proportion of the resinous component.

From an examination of a piece of coal it was possible to picture the vegetation of the carboniferous period; and the forests from which the coal fields were accumulated must be imagined as consisting largely of trees closely akin to club-mosses, but immensely greater in growth, of other kinds of coniferous trees, and of enormous ferns. Every seam of coal was found to rest upon a bed of some other substance, generally shale, traversed in all directions by the roots of plants. This substratum was clearly, therefore, the soil on which the coal plants grew, for all these roots could be identified with the stems of the plants found in the overlying strata. Upon a seam of coal there generally was found to rest a bed of shale or sandstone, which was nothing more than a petrified mudbank or sandbank, and in either case must have been accumulated by the action of water.

The coal seams were, therefore, at one time covered with water, the inundation being accounted for by the dropping from time to time of the surface of growth. Of the time required for accumulation of any one coal seam, the geologist could say absolutely nothing. It was a noticeable fact that the coal-fields of this country existed as a series of isolated basins. How was this to be accounted for? Taking a section of the strata from Manchester to Derby, it was found that at the Pennine range the stretch of coal-measure rocks was interrupted by the intrusion of the lower strata, but resumed on the other side of the mountain chain. As for every seam of coal occurring on one side of the hills there was found an equivalent on the other side, it was to be concluded that the coal seams had been at one time continuous. Convolutions had taken place in clearly defined lines, and one of them could be traced through the south of Ireland and Wales toward the southeast of England. From this fact Prof. Dawkins said that he had no doubt that basins of coal-producing rocks were to be found in the last-mentioned area; and, in fact, an experimental search for one of them was at that time proceeding at Dover.—*English Mechanic*.

**VEGETABLE AND MINERAL COLORINGS.**—So great has been the substitution of colors obtained from coal-tar for vegetable, wood, or

animal dyes, that only two of the vegetable class now retain any great importance—indigo and logwood. Lac dye has been entirely displaced, and the consumption of cochineal has dwindled down to a very small amount. The fallacy of the opinion that coal-tar dyes must necessarily be fugitive and poisonous, and that there could not be produced from them as fine a shade as that obtained from the vegetable dyes, has been abundantly disproved, and the increase in the consumption of the new dye during the last year is found to be more than 33 per cent, this increase taking place quite exclusively in compound colors. Indeed, no fabrics are now dyed in any of the pure colors, and the augmented consumption has taken place in judiciously blending these colors with themselves, or with vegetable dyes, so that there are now some 150 different colors obtained from coal-tar, independent of indigo or any vegetable dyes. The amount of coloring matter derived from a ton of coal is very large, while the dyeing power of the coloring matters due to this source is really immense; thus, the magenta derived from that quantity will dye 500 yards of flannel, the aurine, 120; the vermilion-scarlet, 2560; and the alizarine, 255—Turkey-red cotton cloth.

**THE COAL-TAR SUGAR.**—Our readers generally have heard more or less of that remarkable substance, extracted from coal tar, which is some 300 times sweeter than cane sugar, and many no doubt have been looking forward to the time when this new saccharine material will be introduced into our domestic economy. The *German Sugar Manufacturers' Journal* recently announced that a large establishment for its production is nearly ready for business near Magdeburg in Germany. That journal further states that it is expected that the new sweetening substance will be largely used for mixing with glucose. One part of this substance mixed with 500 parts of glucose will make the latter a sweetening compound equal to the heat cane or beet sugar that can be made. In the meantime, according to the *London Telegraph*, the coal-tar sugar has been manufactured on a small scale and sold in the form of small tablets, which are put up in tiny phials about two inches long, and may be carried in the vest pocket. The tablets or disks are white, four of which will lie upon an English three-penny piece, and are very thin. One of these disks dissolved in a cup of tea will impart a delicious and most excessive sweetness. This sugar is said to be of great value for use by people who have a horror of obesity, which common sugars tend to produce. It is also of value for those who are inclined to gout or rheumatism. It is said to have been administered with good results to the new Emperor of Germany in place of common sugar. Should its use in this case be found to continue with favorable indications, it will prove a most effective advertisement for the new article, and might exert a revolutionary effect upon the great sugar industry of the world.

**COFFEE AS A GERMICIDE.**—Professor Heim has recently, by many and careful experiments, shown that caffeine is death to micro organisms; that infusions of animal matter in coffee may be exposed to the air without gathering mold; that the bacilli of cholera cannot live in coffee, and that under its influence the microbes generated in typhoid and malarial fevers have been long known, but has been attributed to the tonic effects on the nervous system. By Heim's showing, however, results seem to be due to the antiseptical properties of coffee.

**MOONLIGHT EFFECTS ON VEGETABLES.**—The influence of the moon upon vegetation is an interesting problem awaiting solution. A recent writer upon the subject mentions that woodcutters in Cape Colony and in India insist that timber is full of sap and unfit to be cut at full moon. Another observation of lunar influence in Cape Colony is the rapid spoiling of meats and other provisions when exposed to moonlight, though this may be due to the fact that the light serves as a guide to insects.

**ANOTHER NEW EXPLOSIVE.**—Rev. Father Donahue of Charleston, Ill., has discovered a new explosive which he calls laterite. In effect it resembles the Russian lectover, the most effective explosive known to science. He claims that, if anything, it is superior and more deadly. It is put up in fuses and is made from pine gum. He claims that with it gunpowder can be made much more cheaply, and that the new compound will displace gunpowder in time.

**ELECTROLYTIC ALUMINUM.**—L. Senet has devised a new process for obtaining aluminum, as well as copper, silver, etc., by electrolysis. He exposes a saturated solution of sulphate of alumina, separated from a solution of chloride of sodium by a porous vessel, to a current of six or seven volts and four amperes. The double chloride of aluminum and sodium is decomposed and the aluminum is deposited upon the negative electrode.

**A NEW SILVER ALLOY.**—J. Scully of Calcutta has found that the addition to pure silver of but four-thousandths of its weight of his-muth renders it brittle when cooled slowly. When cooled quickly the effect is not so marked, but still sufficient to render it unserviceable for coinage.

## GOOD HEALTH.

## The Desire to Attain Old Age.

The St. Louis *Globe-Democrat* has been publishing a series of articles on old age. We copy the following in relation to the desire for such a consummation, which will be followed next week by another detailing the physical changes of advancing years and the cause of the failure of the mental powers:

It is evident on the slightest observation of our race that old age can be attained by only the smallest minority. This is the rule of every animal race, and man is merely the crowning effort of nature in all the animated creation. It is very evident that this is a conservative process in the long run and calculated for the best interests of mankind. Were all the maimed, the vicious, the imperfect specimens to survive to 90 or 100 years, on an equal footing with the most favored of humanity, too great an opportunity would be afforded for the survival of the those least fitted for the race of life, while the "fittest" would be perpetually overhounded with the care of those least able to meet the exigencies of the "struggle for existence." There is no race of animals or plants the majority of whose members attain adult life, still less advanced age.

Hence the hope of prolonged life has no foundation in analogy. The weak and imperfect must fall early in the strife, else there would be neither room nor support for those which ought to survive. The enormous mortality of children under five years of age, the devastations of the infectious diseases generally, and especially those recognized as epidemics, the waste of life in war and famine, all contribute to the general welfare, whatever may happen to individual sufferers. The increased average length of human life, observed within the past 50 years, offers no hope of death from old age ever becoming the natural and usual termination of the life of men. It is by no means likely that an extension of the ordinary life to 100 or 150 years would add at all to the sum total of happiness—rather the contrary. All who have carefully observed the condition of the aged concur in the opinion that the infirmities of both body and mind, which are accompaniments of greatly prolonged life, are drawbacks of a most serious nature, and calculated to render great age extremely undesirable.

Notwithstanding the discomforts and infirmities of old age, the desire for prolonged existence is almost universal. It seems to be an expression or outgrowth of that instinct of self-preservation that becomes extinct only with long-continued suffering or from the shock of great and repeated disappointments. Like all the animal instincts, that leading to self-preservation is unreasoning. It is as strong in the idiot as in the sage. The instincts are the property of the race and are, in fact, memories that have become organized in the central nervous system, which are transmitted from the ancestry as well defined as are the features of the countenance or the peculiarities of thought and disposition. As may be inferred from this, the instincts are principally useful as conducive to the welfare of the race in which they appear; but they are not always of service to the individual members of that race. The fact that most people desire to reach old age is not a sign that old age would prove of any particular advantage to every man or woman who feels this desire.

The intense desire to prolong the earthly life has led to some remarkable results. The search of the old alchemists for the philosopher's stone that should transmute the baser metals into gold, was varied by the quest for the elixir of life or universal remedy which should cure all diseases and restore the partaker to all the joys of youth. It is quite likely that desire for prolonging life was an incentive to study and research as strong if not stronger than avarice in the lives of these old students of nature. One important consequence of this study was the finding of the science of chemistry, which is at the basis of most modern industries. With chemistry came increased development of all the medical sciences. The end and aim of the modern physician are very like those which actuated his predecessor—the alchemist of the dark ages. He no longer dreams of finding the elixir of life, the universal remedy, or the fountain of perpetual youth. The alleviation of pain, the removal of disease by increasing and supporting the natural powers, and thus, indirectly, prolonging life, are the more important of his objects.

**STUDY AND HYGIENE.**—The question of home study and the amount which should be required is one that is at present receiving a great deal of wholesome attention. There is, however, a physical phase of this subject which demands quite as much attention as its more manifest intellectual ones. It is distressing to see young and growing children carrying, day after day, a heavy pile of books to and from school. Usually this weight rests wholly upon the left arm, and young ladies attending our high and normal schools are frequently obliged to stand, thus overladen, in crowded horse-cars. This daily transportation of piles of books inevitably produces more or less one-sidedness, with one shoulder higher than the other, one hip higher and larger than the other. But worst of all, it is responsible for many cases of curvature of the spine and the

countless evils which accompany it. This tragic fact is sufficient in itself to condemn home study, unless the amount of work can be so modified as to proportionately reduce the burden borne by these young shoulders. Mothers can see with their own eyes, if they will but use them, the deplorable results of the much study, which, in a different sense from Solomon's, is a weariness to the flesh, and should vigorously protest against its exactions. This is one of the many evils of our schools, which the public—that vague, irresponsible body—in other words, the fathers and mothers of our land, will be obliged to take not passive but active cognizance of, and against which they will sooner or later be forced to wage aggressive warfare. The creation of this sort of public sentiment is the only power which can be brought to bear upon committees, trustees, and boards governed either by ignorance or by politics. It is the only remedy which can ever be found for the errors of the system of which so many parents complain, so few lift either voice or finger to combat. Gulliver, in his travels among the Lilliputians, encountered a genius who cherished the idea of building a house by beginning at the chimney. Not one whit less ridiculous is the notion that any moral or mental superstructure can be raised without a sound physical foundation.

**COLOR BLINDNESS A BRAIN AFFECTION.**—Professor Ramsay believes that the particular defect giving rise to color blindness lies, not in the eye itself, but in the brain. Certain persons he points out are incapable of judging which of two musical tones is the higher, even when they are more than an octave apart. Yet, as such persons hear either tone perfectly, the defect is not one of deafness. He accordingly argues that in such persons the brain is at fault, and thence proceeds to the assumption that it may be equally true that the inability to perceive certain colors is not due to a defect in the instrument of sight by the eye, but to the power of interpreting the impressions conveyed to the brain by the optic nerve. If this is the case, the problem is no longer a physical one. It falls among those with which the mental physiologist has to deal.—*The Medical Press.*

**HOPE FOR CONSUMPTIVES.**—Every year brings forth new hopes for consumptive patients, and some eminent men think that the discovery of a remedy for this too common disease is now but a matter of time. Garcin has found that the inhalation of air containing a small amount of hydrofluoric gas has a remarkably good effect on consumptives. Of 100 cases so treated 41 per cent improved and 38 per cent were cured. Hydrofluoric acid kills the bacilli of disease, and as phthisis is caused by the presence of these lower germs of life in the lungs, their destruction removes the cause of the disease; hence, if the patient is not too far gone, it is reasonable to expect an improvement.

## USEFUL INFORMATION.

**TO FILL CRACKS OF WORM-HOLES IN FURNITURE.**—A correspondent of a contemporary recommends sawdust or raspings of hard and soft wood for filling the cracks and worm-holes in old furniture, which he says he learned from the Oriental carpenters. The sawdust is sifted through wire gauze, and each kind kept by itself. He says: "For a crack, a worm-eaten hole or a deep flaw, prepare the proper dust by the admixture of brickdust in flour (also kept ready), of whitening, or ochre, or any required tint. Then take well-cooked glue, and on a bone-plate stir it in slowly while hot, with sufficient powder for your work. Dab the hole or crack with your glue brush, then with a putty knife stir about the mixture on the plate, taking care you have the right color. When sure on this point, take some of the cement on the end of the knife and insert it in the desired place. Then use as much pressure as you possibly can with the blade, and keep smoothing at it. Sprinkle a little of the dry powder on the spot. When thoroughly dry, sandpaper the surface with an old used piece, so as not to abrade the joint. You can then varnish the mending. Where weevil and wood-worms have devoured the furniture, cautiously cut out the part till a sound place be reached. Poison the wood with a solution of sulphate of copper injected into the hollow. Let it dry. Cut an angular piece of same wood from your board, and with a sharp chisel make a suitable aperture for its reception. Fix it with glue. When thoroughly dry, work with carving tools or rasp and glass, scraping till the new bit of work exactly matches the old."

**TO DESTROY CERTAIN TASTES.**—A plant has been discovered in India which possesses the singular property of destroying the taste of sweetness. After chewing the leaves, sugar placed upon the tongue conveys no more sense of sweetness than grains of sand. It also has the property of destroying the power of enjoying a cigar, and even masks the bitter taste of quinine. The peculiar properties of the plant are dependent upon the presence of an acid, which can be dissolved out by alcohol.

**VARIETIES OF COKE.**—The difference of result obtained by heating organic structures from ordinary to high temperature, rapidly or slowly, to expel volatilizable parts, is well known in the difference in the structure of coke produced from ordinary bituminous coals

in gas retorts, and that from the same coal in coke ovens. Gas coke, which is made by rapidly heating the coal, is in the form of a spongy, porous mass, weak in structure, insonorous, easily ignited, and having the appearance of a mass from which bubbles of gaseous matters have escaped. Oven coke, which is made by heating comparatively large bodies of coal gradually and continuously for a long period, is of a close-grained structure, capable of sustaining great pressure or weight, and so compact and dense that it is insonorous. This gas is far more difficult to ignite than the gas coke.

**USE OF SAWMILL REFUSE.**—It is interesting to notice the practice which is followed in Sweden of producing gaseous fuel from sawdust and waste wood from sawmills, one of the prominent steel works (Domnarvet) being reported as depending almost entirely on such fuel made in producers into which are charged sawmill refuse and sawdust. Being as yet untried in this country, notice of the possibility of such a utilization of what is now waste material is made here to show that, should there be any deficiency of mineral fuel, an iron or steel works might be sustained if the cost of producing the gas from wood was not found to be a barrier. The quality of such gas is satisfactory, but the condensers, which are necessary on account of the percentage of water in the wood, make the plant more expensive to construct and maintain than producers using mineral fuel. Time has not permitted a thorough consideration of such application in connection with an iron and steel industry at Duluth, but there is no question as to its practicability. The problem to be decided will be rather one of the comparative economy depending upon gas made from mineral fuel or gas produced from vegetable fuel, and the possibilities of a continued supply of material for the producers. For the present such supply appears evident from the large deposits of sawdust clogging the water-courses, and the great heaps of sawmill refuse which are constantly kept burning.—*English Paper.*

**GREEN AND DRY LUMBER.**—The extraordinary demand for lumber is bringing out a great variety of drying processes, covering cold air and hot-air methods. It pays to expel moisture in order to save freight. Slow seasoning is out of date. Improved methods in the preparation of lumber are appearing everywhere and the better prices realized are stimulating the demand for driers. A discussion is going the rounds of the press as to the relative strength of wet and dry timber. There is not much made out of the discussion. Some kinds of timber are stronger when dry, while other kinds are stronger when wet or green. It is safe to say that all woods are harder and less pliable to bend when dry than when wet or green. But most hard woods when wet will possess more tensile strength than when dry. Timber thoroughly seasoned is more brittle than when green, and with the necessary force will break square off, while the same timber green would stand about the same pressure by bending more or less without breaking. Take a hickory sapling that it is almost impossible to break in its green state, although it may bend double, and thoroughly dry it, and you may easily break it almost "square off," as the boys say. So with almost any kind of timber. Drying makes it stiffer, more unyielding, but in very few instances stronger.

**CRIMSON-STAINED WOOD.**—The following is a crimson stain that is frequently used for decorative woods for musical instruments: Ground Brazil wood, one pound; water, three quarts; cochineal, half an ounce; boil the Brazil wood with water an hour, strain, add the cochineal, boil gently for half an hour, when it will be fit for use. This is first applied, and then the varnish, consisting of rectified spirits of wine, half a gallon, six ounces of gum sandarac, three ounces of gum mastic, and half a pint of turpentine varnish; put the above into a tin can by the stove, frequently shaking till well dissolved; strain and keep for use. If it is harder than is wished, thin with more turpentine varnish.

**ELECTRO DEPOSITED STEAM PIPES.**—By a method, practiced in England, for making copper steam pipes, the copper is electrically deposited in the proper form, doing away entirely with brazing. This has been done before, but the strength of the copper has been destroyed. This difficulty is said to have been obviated and copper pipes of great strength obtained.

**YELLOW OR ORANGE STAIN** for wood is one of the most sought for in ornamental or cabinet work. A beautiful result is reached by diluting 1.2 ounces of finely powdered turmeric for several days in 17.5 ounces 80-per-cent alcohol, and then straining through a cloth. This solution is applied to the articles to be stained.

The following are the items in the river and harbor appropriation bill for California: Humboldt, \$150,000; Oakland, \$175,000; Wilmington, \$90,000; Redwood, \$7400; the Mokelumne, \$2000; San Joaquin, \$25,000; San Luis, \$25,000; Sacramento and Feather, \$20,000; San Diego, \$1000; Napa, \$7500; Petaluma, \$2000.

**NIGHT AND DAY GROWTH.**—Fruit trees acquire most of their growth by night. The fruit of the cherry laurel, for instance, increases at the rate of 90 per cent at night and only 10 per cent by day, while apples increase 80 per cent at night and 20 per cent in the daytime.

## ENGINEERING NOTES.

**RAPID EXTENSION OF CABLE ROADS.**—A paper was recently read before the Western Society of Engineers at Chicago, by D. J. Miller, on the subject of Traction Rope Railways. This is a matter which is now attracting great attention in every progressive community, so that any facts concerning the cost of building, etc., of such lines are of great interest. Mr. Miller says: "Four years ago there were in the United States 36½ miles of cable road in operation and under construction. January 1, 1887, there were 152 miles in operation and under construction. It is estimated that during the present year at least 100 miles will be added to the above figure. While some of the latter roads contain valuable improvements, there are others the designs and workmanship of which could not well be worse. Within the last year or two many unscrupulous speculators have manifested a decided interest and activity in cable work, attempting, especially of late, to palm off on the public what they are pleased to designate as some particular system of cable traction, the so-called system in reality containing not one element requisite to a good road; but this method of propulsion has grown in popularity so rapidly that many capitalists willingly invest in cable roads regardless of their merits or demerits."

**CONNECTING THE MISSISSIPPI WITH THE LAKES.**—It is said that the canal project now being carried out to connect the Mississippi with the great lakes is already well-nigh completion. The improvement of the Illinois river from its mouth to La Salle is about completed—a distance of 225 miles—leaving not more than 80 or 85 miles more to complete the work to the lake at or near Chicago. The improvement thus far consists of a system of locks and dams that will provide a navigable channelway of seven feet depth at low water for all classes of Mississippi river steamboats, and for such gunboats and war-vessels as it may be found expedient or necessary to transfer between the gulf and the lakes in case a vigorous and proper defense of our country should ever require this to be done. The same system of improvement will be continued to Joliet, a little more than half the remaining distance, from which point it will be continued along the most feasible route, which is yet to be decided upon. The plans and estimates, based upon accurate surveys, has been prepared by direction of Congress for continuing the improvement as far as Joliet. From this point to the lake the surveys are yet to be provided for.

**ANOTHER STUPENDOUS ENGINEERING SCHEME.** This is, in very fact, an age of stupendous schemes, and the railway comes in for its due share. Prominent among these, in so far, at least, as the features of daring and magnitude are concerned, is the proposal to build a line of railway to connect Minneapolis and St. Paul with Pekin, China and Irkutsk, Russia, via Victoria, B. C., and Cape Prince of Wales, Behring strait, involving among other astonishing things the bridging of Behring strait, which at the point suggested in this scheme is only 35 miles wide and from 20 to 25 fathoms deep. The distance from Victoria to Cape Prince of Wales is about 1100 miles. It is not stated who the moving spirits in this stupendous enterprise are further than that they are western men, which leaves no doubt that in the matter of enterprise and daring at least there will be nothing lacking.

**A STEAMER WITH A PROPELLER FORE AND AFT.** It is said that a steam propeller, with screws fore and aft, is to be built for the Hoboken Land and Improvement Co., to be used as a ferryboat on the North river. In propellers the engines can go below deck, thus saving the space occupied by the paddle-boxes. The propeller is faster and can make better headway against floating ice. There is, besides, less danger of injury from drifting logs. The new boat will be 200 feet long and 37 feet beam, with powerful engines, and cost in the neighborhood of \$100,000. If she proves to be a success others are to be built, and the old ferryboats will be altered to the new model.

**THE PROPOSED ENGLISH CHANNEL BRIDGE.**—Detail estimates for a bridge over the English channel have been laid before the Minister for Public Works by Vice-Admiral Cloué, of the French navy, in the hope of obtaining a government subvention. The sanguine promoters think this scheme will meet with less opposition from military men than the tunnel project. The cost is estimated at \$220,000,000, on which a net profit of \$20,000,000 per annum is expected.

**CONNECTING LAKES ERIE AND MICHIGAN.**—A number of Western capitalists have united in the project of connecting Lakes Michigan and Erie by a ship canal 40 miles long, across a narrow neck of the upper Michigan peninsula. The distance by water between the two points is 300 miles, and forms a very difficult and dangerous piece of navigation. The estimated cost of the canal is \$5,000,000.

**THE TRANS-CASPIAN RUSSIAN RAILWAY** has reached "Chargui," or Chargo, as it is spelled on the map. This point brings the Russian locomotive within 240 miles of Herat and within 450 miles of the nearest practicable approach to the British Punjab. Where is this road to end? Perhaps on the Arabian gulf. Who knows?

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**SUTTER CREEK.**—Cor. Amador Ledger, March 31: Since my last writing a big strike has been made in the Wildman mine. Your correspondent was taken all through the mine this week. Through the courtesy of Mr. Tregloan, the superintendent, and the foreman, Mr. Smithernum, he was shown every level in the mine. On reaching the 300-foot level, we came to a ledge about 15 feet wide, of good paying ore. At the 400-foot level we found a ledge well defined, about 5 feet thick, of good rock, and on going to the bottom, the 500—where they have made the strike—about 300 feet from the shaft the ledge is about 5 feet thick, and the rock will go at least \$25 per ton. It must be remembered that the shaft is located on the extreme northern boundary of the claim, and the rock spoken of is all going south, so that the indications are excellent for a fine-paying mine for many years. The owners and managers feel jubilant over the strike.

**PLYMOUTH CONSOLIDATED.**—Amador Ledger, March 31: An effort is to be made to work the Pacific mine, notwithstanding the fire. The Empire shaft being the highest by a few feet, the smoke and gases generated by the fire find vent through that opening. A plan has been suggested, and will probably be carried out, to increase the draft by building a chimney 20 or 25 feet high over the Empire shaft. By this means, with the assistance of a fan in the Pacific shaft operated at the level of the fire, it is hoped to leave the latter mine sufficiently free from smoke to enable it to be worked without inconvenience or danger. There is great objection to extinguishing the fire by flooding, on account of great damage to the works likely to result from such a course. Flooding is not likely to be tried, except as a last resort. It might be practicable to extinguish the fire from the Pacific shaft, were it not for the fact that as the timbers are devoured by the flames, the ground caves, shutting off approach.

**MISCELLANEOUS.**—The flow of water in the Amador gold mine, reported in our last, has so far subsided as to permit of the resumption of work in the drifts. Both east and west drifts are again being worked, and the mine is now giving employment to 20 men. The North Star shaft is down 320 feet, and is said to be in ledge formation. W. G. Anderson is driving the tunnel on the New York claim, three miles southwest of Jackson. It is in over 300 feet, and has 50 feet further to go to reach the point where it is expected to strike the ledge.

## Calaveras.

**ANGELS.**—Echo, March 28: The new hoisting machinery is being rapidly placed in position at the Utica. It is rumored that the Tozier has shut down for a few weeks. We were shown some rock from the Uno mine, the property of J. P. Sylvester & Co., and it looks well, averaging \$15 a ton. A fine concentrator with the Marse belt has recently been added to the Hardy & McCreight's mill at Albany Flat. Rumor has it that more mining property in this section will soon change hands. The more the merrier.

## El Dorado.

**MINING PURCHASE.**—Georgetown Gazette, March 29: The Walker Bros., through their agent, J. H. Morton, have bought the mine owned by Chas. Forti and John Austin and also the Wall Street mine from G. H. Barklage. Both of these mines adjoin the Alpine mine. This company bought the Alpine about three years ago, and, by their perseverance and the good management of Supt. Morton, have developed a very promising mine. They are now erecting a ten-stamp mill, the stamps to weigh 1000 pounds each. We hear that the site for the mill is being graded large enough to give room for 30 more stamps, which will be added as the mine is opened up. As this mine is only about 2½ miles from Georgetown, it is an enterprise of much importance to our citizens, and is only another demonstration of what capital and well-directed energy will accomplish on this divide.

**GRAVEL.**—Placerville Observer, April 3: Wiley Sexton and Frank Pincini are taking out 14 carloads a week of gravel that averages about \$10 to the carload. They work to great advantage for want of proper opening to their gravel channel, their present tunnel being too high. They handle all the gravel three times before they get it on the dump. Mr. McDonald, superintendent of the Mount Pleasant mine, at Grizzly flat, has arranged with A. McAfee to sink the shaft on the Ohio mine 30 feet south of the Mount Pleasant line, and drift from that shaft north to their own ground. Several men have been set to work, and favorable results are expected, as a large vein of pay ore is known to exist there.

## Fresno.

**GRUB GULCH.**—Cor. Fresno Republican, March 31: Grub Gulch is a mining camp in the foothills, about 70 miles north of Fresno city, and 14 miles from Raymond, the nearest railroad point. It is situated in a beautiful gulch on the southwest slope of the Sierra Nevada mountains, and the main highway leading from the great San Joaquin valley to the Yosemite, passes through the center of this camp. Among the principal mines now in operation are the Josephine, Gambella, Knob Hill, Enterprise, Red River, Antelope and many others. The Josephine has a shaft over 400 feet deep, and employs about 25 miners, furnishing ore enough to keep a 20-stamp mill running day and night. The Knob Hill was purchased lately by a stock company for \$10,000, and a 25-stamp mill will soon be erected to work its ore. The Red River and Antelope mines have also been purchased by stock companies, who intend to erect a mill. The camp is alive with experienced prospectors, and new leads of immense value are being discovered every few days. The climate of this locality is quite delightful, and at this season of the year the thermometer averages about 65 degrees.

**A PROMISING PROPERTY.**—Fresno Expositor, March 28: D. H. Jackson of Oakland is largely interested in quartz mines about 28 miles from Fresno in a northerly direction, on the San Joaquin river, and about 4 miles south of Hildreth. Mr. Jackson invested in the mining properties in July last, and since that time has expended considerable

in money and much in labor in developing what he has good reason to believe will prove remunerative mining property. The principal ledges, or those on which the most work has been done, are the Fleming, Gold King and San Joaquin. In addition to these he has 12 other localities undeveloped. The Fleming has over 1000 feet of shafts, drifts and winzes, and is one of the best developed mines in Fresno county. The vein was tapped by a tunnel at a depth of 145 feet from the surface, and two drifts forming a level were run a distance of 556 feet. Two winzes were sunk below this level, one 75 feet, the other 30 feet, and four upraises were made from this level to the surface. The ledge, which runs in granite, is from 1 to 4 feet in width, averaging 2½ feet. The ore is free milling, and was worked by arrastra before the property passed into the hands of the present owner, and it paid from \$26 to \$94 per ton, this being selected ore. Mr. Jackson considers the Fleming good for an average yield of \$15 per ton by milling. The ore can be mined and milled for \$2.25 per ton. Twelve men are now employed in the Fleming mine, which force will be increased to 60 or 70 on the completion of a ten-stamp mill, to be erected this spring, the work to begin by the 1st of May next.

**THE GOLD KING** is less developed than the Fleming, but has been sufficiently prospected to satisfy the owner that he has in it a valuable gold mine. This mine will be tapped by a tunnel 500 feet in length, which is now in 425 feet. On the top of the hill, toward which the tunnel is now being run, three shafts have been sunk on the ledge, respectively 45, 50 and 95 feet, showing good ore, similar to the Fleming, along the vein. Seven miners are employed in the Gold King.

**THE SAN JOAQUIN**, a similar formation to the Fleming and Gold King, has a number of shafts sunk on it, ranging from 10 to 85 feet deep, and the ledge at all the points reached shows well in free gold. The ore contains about half of one per cent in sulphurets, in the working of which concentrators will be used.

## Inyo.

**PANAMINT BULLION.**—Index, March 28: A silver bar 191 pounds in weight was expressed to San Francisco from Independence last week. It had been turned over to the men by the company in Panamint, and while not sufficient to pay them in full, they say it is a whole lot better than nothing.

**REFITTED.**—Inyo Register, March 30: Some good ore is being taken out of an extension of the Brauerstein mine, owned by Doc. Graham and others. It is situated in Piute canyon. The Casey mill is being refitted preparatory for a run. The cold weather did a little damage.

**DEATH VALLEY.**—Deputy Assessor Melone furnishes the following in regard to the southeastern portion of Inyo: "Coleman's borax works have an inexhaustible supply to draw upon. They have 57 crystallizing tanks holding 1800 gallons each, and 8 receiving tanks, 2000 gallons each. The borax remains in the crystallizers from 10 to 14 days, when it is ready for sacking. Five teams of 18 animals each transport the product to Mojave, 160 miles away, the trip taking 20 days. At Panamint the boys were on a strike for their pay. Supt. Fairman turned over two bars of bullion as part payment, and secured them for the balance with 30 flasks of quicksilver—amply sufficient to cover all due them. They have shipped the bullion."

## Nevada.

**CHANGED HANDS.**—Grass Valley Tidings, April 3: Within the last day or two, two of the most indefatigable, moneyed and successful mining men on the coast have become largely interested in a Grass Valley mine of promise and intend to immediately and energetically advance developments. The property purchased is known as the Peabody mine, situated on the west slope of Gold Hill—a locality from which millions of dollars in gold have been extracted. The purchasers are Alf. Tregidgo, one of the owners of the Washington and Bluebell mines, of Washington district, this county, and his partner, Baron Von Schroeder of San Francisco. These gentlemen have secured a controlling interest in the property, paying quite a handsome sum therefor. The transfer was made last Saturday, through Weisshein Bros. & Co. Adequate hoisting and pumping works and a 20-stamp mill are to be placed on the mine, the work to be initiated very soon. Good prospects for success are afforded by the Peabody, and that such end may be achieved and the new operators thereby encouraged to launch into other ventures of this nature, will be the earnest wish of everybody on being apprised through these columns of the transfer. A pleasing feature of the deal is that one of our persistent prospectors—one who has spent every cent he could rake and scrape for half a lifetime in unsuccessful ventures—is enriched by several thousand dollars.

**GOOD ORE.**—Saturday last a nine-inch ledge was uncovered in a north drift of the Pittsburg mine at Deadman's Flat—in new ground and 40 feet from surface. The quartz is well charged with minerals and shows gold. Expert miners are of the opinion that it will return from \$80 to \$100 to the ton. The shaft is being cleaned out and other work done, preparatory to an inspection shortly by the San Francisco capitalists who at the instance of Charles E. Clinch have become interested in the property and propose to spend some money on it. The W. Y. O. D. Co. are crushing at Larimer's mill, of which they have a lease. Yesterday a partial cleanup was made and yielded handsomely. The mill will be kept busy for 10 or 12 days yet.

**UP-COUNTRY MINES.**—Tidings, March 30: A year ago Alf. Tregidgo and partner, Baron Von Schroeder of San Francisco, purchased the Bluebell mine of Washington district, agreeing to pay for the property on or before the first of last month. This they have done, in addition to making extensive improvements, with money extracted from the mine. Now they have an 8-foot ledge which yields from \$10,000 to \$15,000 a month, from ore reduced in a 10-stamp mill. Mr. Tregidgo and partner are owners of the Washington mine, which is also paying satisfactorily. On the two properties they have expended \$100,000 and value them at \$500,000. There is two years' ore in sight. The Bluebell is an extension of the Eagle Bird. All the mines in Washington district are doing well, the Yuba never looking better.

**THE DELHI MINE.**—Grass Valley Union, March 30: County Surveyor Urey, who has visited the Delhi mine this week, says that remarkably rich ore

is being taken out, nearly every piece showing gold, and plenty of them showing rich streaks of it. The pay shoot has been found from the surface to the depth of 600 feet, which is the level of the lowest tunnel, and the pay shoot on the dip of the vein is over 200 feet in length. There is no doubt that the vein carries its rich ore to a deeper depth than is given by the tunnel, and no one can foresee as to the time when the treasures of the mine will become exhausted.

**PENNSYLVANIA.**—Grass Valley Union, March 29: A crushing of ore from the Pennsylvania mine is being worked at the Crown Point mill, and the appearance of the plates indicates that a good cleanup will be made. The north drift in the Pennsylvania is yet on a good-sized vein of pay ore.

## Placer.

**FOREST HILL DIVIDE.**—Cor. Placer Argus, March 31: The Gray Eagle mine which is prospecting our deep gravel channel on such an extensive scale, is the center of attraction at present. Their shaft is now down 240 feet and no bedrock yet in sight. By a comparison of the rich gravel recently found at the Dardanelles and that through which the Gray Eagle is now passing, no perceptible difference can be seen, both having the same character of formation peculiar to the ancient Lost River of the Forest Hill divide. Supt. T. G. Durning came from the Bay last Friday, and according to an arrangement with Mr. R. L. Dunn, C. E. and U. S. D. M. S. of Auburn, who came up here on Monday, the locating of a tunnel site for the Gray Eagle Co. was the order of the week. It was ascertained, we learn, that by running a tunnel 2125 feet they could attain a depth of 322 feet beneath the present location of their works. This is believed by all to be a sufficient depth to work the entire lower portion of the divide, including the rich placers of Todds valley and vicinity. It was discovered that the site of the proposed new tunnel was not on the company's ground, but was a part of the public domain; it was therefore immediately located, thereby adding 55 acres to their already valuable property. Mr. Durning also located the Owl creek canyon for 3000 feet below the tunnel site, giving them a sufficient length of sluices to thoroughly wash their gravel. Mr. Bouglis has arrived from Paris, and the syndicate of French capitalists which he represents will shortly commence operations on the Spring Garden mine and adjoining properties which they recently purchased in this district.

**LONG TUNNEL.**—Placer Herald, March 31: A. Rodgers, superintendent of the Dam claim, located just above the Hidden Treasure, was in town this week. Mr. Rodgers says their tunnel is in over 4000 feet. They have run through a lower channel running across the channel they are working. His company employs 16 men. The claim is paying comfortable dividends. According to Mr. Rodgers the Red Point has the best equipped tunnel in the county. It is double-tracked and perfectly dry. The company employs 38 men. The mine is paying well. The Hidden Treasure is in better condition than ever and is paying very well. Mr. Rodgers anticipates busy times on the divide this summer.

## Plumas.

**VARIOUS MINES.**—Plumas National, March 30: Rich ground has again been struck in the Buckeye claim at Sawpit. The pay lead was lost for a time, but under the management of August Holtz it is again paying about \$12 to the man, with good indications that there is plenty of ground of that kind. John Kiefer and W. Reece of Washington Hill are busy at work, with good success. Thomas Lawrence has about finished his contract of running a tunnel in the Thomas claims on Poorman's creek. Sam Galbraith and Taylor Hill have gone to work on the Orr claim, cleaning bedrock. Bell & Co. have struck good pay in a shaft near Newtown, but owing to the melting snow they are not at work at present. McDonald & Co.'s claim on Mill creek is a regular paying one. Good wages for every day's work done. The Bunker Hill at the head of Hopkins' creek is immensely rich. One of the men picked up about \$80 in slugs last week while cleaning bedrock in the tunnel. Twenty men are employed, and it is without doubt the best drift mine in the county. Work will be commenced on the King Solomon mine as soon as the snow will permit. C. W. Smith & Co. at Spring Garden are busy at work. They struck a lead of lamper eels a few days ago, and believe that in a short time they will find good diggings. Bennett & Morton have been making good wages cleaning up the cuts in the Orr claim. A. E. Leavitt has struck good-looking gravel in his claim at Elizabethtown, and expects to be in good pay in a short time. This promises to be a dry year. There is not enough water to run a hydraulic claim, even if the owners were so inclined. Jake Ehrickson has his tunnel in 800 feet on the O'Brien claims, on Waponaie, and is doing well, with pay grit in sight to last for years. There is a large body of gravel, blue as indigo. The Murdoch Bros. are about 1000 feet further up the creek. Their tunnel is in about 300 feet, and they have an immense dump, full of pay gravel, which will be washed as soon as there is sufficient water. They have washed enough to know that they will be paid for their winter's work. Gus Kurtz and John Detman are doing well on Rock creek. The gravel pays good wages, and in working it they have struck a four-foot ledge that prospects well, and will, without doubt, pay for working. The Plumas Eureka mine is looking better than for some time, with ore enough in sight to keep 60 stamps running for years. The Consignee mine, near Cromberg, has its shaft down 360 feet and struck water last week. There is about 75 feet of water. Work is stopped for the present. The Pittsburg Co., on the head of Poplar creek, has graded a mill-site, and will put up a mill as soon as the roads will permit of getting in machinery. Frank and Will Richards have started work in Burton's gulch, near Silver creek. This is a famous gulch for its richness in the past, and if the boys can strike the channel that fed it, they have a fortune. It is reported that a very rich ledge has been struck south of Plumas Eureka, by a miner called Wild Chris. There has been some of the rock assayed, which runs from \$9 to \$1000 per ton.

**PROSPECTING BEING DONE.**—Greenville Bulletin, March 30: From Supervisor Knickrem, who was in Greenville from Mohawk on Monday, we learn that that section of country is in a very prosperous condition. The Eureka mine is understood to be enjoying a degree of prosperity greater in extent than for many years past. The large 60-stamp mill

is kept busy all the time on high-grade ore, which is taken from a recent development whose extent and quality absolutely guarantees a large yield for many years to come. The present yield is about \$40,000 per month. Of necessity, a large force of men is required to operate a mine like this. At present, about 250 men are employed by the company directly, which, as it pays good wages, is able to retain experienced and competent miners. These are deemed the most profitable class to employ. The wages paid are from \$50 to \$55 per month, the company, of course, boarding the men in addition thereto. All hands are paid monthly at least, and semi-monthly if they desire it. Married men are permitted to board at home, and they are allowed \$15 per month for so doing. Under the immediate superintendence of John Hosking, who has occupied that position for years, work is carried on in a systematic and large scale. An immense quantity of wood and timbers is consumed in and about the mine. All of this is furnished by John Nevil, who employs a large force of men and stock to do the work. He has had the contract for years, which, during the coming season, will approximate \$50,000, it is estimated. The company has sent to England for a large pump to use in a shaft, which is being sunk below the Eureka tunnel, the lowest in the mine. It appears to be the intention of the management to prospect the ore bodies below any of the present and past works. If the developments justify, a lower and lengthy tunnel will probably be run to tap these ore bodies which have proven so rich above.

**OTHER MINES.**—On the same range as that of which the Eureka mine is a part, toward Poplar Valley, two Pittsburg companies are prospecting, one for gravel and the other for quartz. The latter has a good prospect. The ledge was reached last summer. The Consignee Gold Gravel Mining Co., at the mouth of Jimson creek, has been prospecting during the past ten years. J. C. Knickrem is the present superintendent. In search of the channel, a tunnel was run 2200 feet. About 400 feet from the mouth of that tunnel, a shaft was sunk 370 feet deep, encountering a large volume of water, indicating that an extensive channel has been reached, which the company proposes to tap with a tunnel 2000 feet long, from the river. The Valentine ledge is situated in the upper end of Mohawk Valley, near McLeer's place. It is 27 feet wide and consists of decomposed quartz, which is very rich in places. With a large mill on it, there is no doubt that it would pay large dividends. A Reno company own and operate an extension of the Valentine. Willoughby, Jones, Dolly and others are interested in a quartz mine in Gold Valley. On top they have good prospects. They are now running a tunnel to strike the vein 300 feet deep, and have only 40 feet more to run.

## Shasta.

**MIDDLE CREEK.**—Cor. Shasta Courier, March 31: Scheerer & Radler are busy pumping water out of the Tellurium. Frickey & Connor, of the Castle Peak mine, are doing some good work on said mine. They are now in about 90 feet, and are taking some good ore therefrom. P. Donahue is at work on the Hope, which also shows up pretty well.

## Sierra.

**ALLEGHANY.**—Mountain Messenger, March 31: The main tunnel of the Union drift company is in 700 feet, within 250 feet of the lead. The Union is owned by Hon. G. G. Clough, Mrs. Jas. Rowell and the Sager Bros. Rainbow Company are working two men on their new, or second ledge, lately discovered. The ore appears well. Buckeye and Tightner Companies are taking out pay gravel. Charles Brainerd and H. H. Brown are running the "Wobler," better known as Forbes' crusher, at the Smith ledge, working outside ore. John Booth, Jas. Clinton and Martin Ellis are working the Highland & Masonic ground through the Excelsior and Eureka tunnel.

**BONDED.**—Cor. Mountain Messenger, March 31: I have been informed that the Empire mine, in Gold valley, has been bonded to the Sierra Buttes M. Co. Five men have gone over to take possession, and to go to work, and more will be sent over in a few days.

## Tuolumne.

**MACHINERY.**—Union Democrat, March 31: Mr. Procter Scott of the Black Oak mine goes to San Francisco Monday, to make arrangements for machinery for the new hoisting works and also to purchase a larger engine.

**MILL.**—Mr. W. N. Harris of Jamestown was in town this week. He will start the Little Gem mill soon. This mine yielded \$100,000 several years ago, and general mining opinion sustains the idea that its future may equal if not excel its past.

**GILSON AND PLATT.**—The company running the Gilson and Platt mine came up Tuesday from San Francisco, and Thursday proceeded to the property for examination. The president and secretary reported the works in fine condition and the mine itself in good ore, with a flattering future before it.

**EAGLE.**—Dr. Tibbits & Co. of Columbia have opened the Eagle mine which is about 12 miles northeast from there; we are told that a splendid chute has been developed. The mines in that locality need mills and appliances very much, as the new mill of Thomas Goodwin on the Stanislaus river is the only reduction process in that locality.

**NEW ALBANY.**—From Mr. Kirke, who was in Sonora this week, it is learned that the New Albany mine is making a record for itself far above anything heretofore prophesied by mining engineers. Those intelligent and enterprising young men, Messrs. Long and Kirke, have, in the course of several weeks, taken out over 200 tons of ore, and they are now running the New Albany mill on the quartz, day and night. It is estimated by competent mining experts, who have made careful estimates, that there is at present enough ore in sight to keep a 20-stamp mill in operation for two years, and that taken as a whole, the quartz will average at least \$10 per ton. The present expenses of getting the quartz out and crushing will not exceed \$1.50 per ton, and even future operations will not exceed an expense of \$2 per ton. The Tuolumne river affords free water all the year.

**STRUCK RICH ORE.**—Tuolumne Independent, March 31: Tibbits & Co. have struck rich ore in their Eagle quartz mine, at Eagle creek, about three-fourths of a mile below the Philadelphia Diggings, above Columbia. The vein in the 200-foot tunnel, at about 80 feet below the surface, shows two feet in

width and very rich in free gold. It is the intention to put up a mill shortly.

## NEVADA.

## Washoe District.

KEYES.—Virginia Enterprise, March 31: Drifting south on the 240 level. The face of the drift shows a number of strata of rich ore, assays from which, during the week, have yielded from \$175 to \$400 per ton. New strata are making on the hanging-wall of the vein continually, showing by their course that all will unite at a point further south.

HALE AND NORCROSS.—From the south drift, 400 level, are stopping ore of good quality. On the 700 level all the stopes are looking well and yielding the usual quantity of excellent ore. During the week have hoisted 1749 tons of ore and shipped to the Nevada and Mexican mills 1580 tons; average battery samples of the same, \$36 per ton. Have bullion on hand and previously shipped this month amounting to \$118,000.

OCCIDENTAL.—In the south drift of No. 5 tunnel, 50 feet from No. 1 upraise, the west crosscut has been extended 12 feet; total, 21 feet. The north drift at the top of No. 2 upraise has been extended 12 feet; total, 31 feet. In the lower tunnel, 150 feet south of the north incline winze, the south drift has been extended 8 feet; total, 46 feet. Extracted 35 tons of fair-grade milling ore.

SAVAGE.—On the 500 level the new working station is completed, and will start the main west drift the latter part of this week. Are extracting ore from the several levels between the 400 and 900 stations, about 60 tons per day, which is being reduced at the Rock Point mill. The balance is accumulating in the ore dumps and in the mine awaiting milling facilities.

BEST AND BELCHER.—On the 425 level upraise No. 1 has been carried up 30 feet; total height above track floor, 150 feet. The formation is quartz, showing value by assay. A work has been suspended at this point. Upraise No. 2 on this level, near the north line, has been carried up from the track floor 30 feet. This raise is wholly in quartz, giving low assays.

CROWN POINT.—The 500 level east crosscut is in 193 feet, having advanced 23 feet since last report. The last 10 feet has been in clay and quartz, yielding fair assays. The 400 level winze was down 60 feet yesterday morning, having improved as depth was attained. They are still following the claywall, and the bottom of the winze is in very good ore.

CHOLLAR.—North drift No. 1, 550 level, is in 303 feet. Average assays had from this drift the past week were from \$25 to \$30 per ton. The west drift from the north drift on the 450 level is now in 78 feet in quartz of low grade. Have struck some very fair ore in the northwest drift on the 650 level, 480 feet north of the Chollar shaft.

HAYWOOD.—Are now working 16 men in the mine. The drift from the bottom of the winze in the deepest workings of the mine has reached the hanging-wall and shows the ledge to be 34 feet wide at that point, which is 270 feet from the tunnel level. Are now drifting in the ore body.

ALTA.—Are upraising on the Keystone vein on the 725 level, and are sinking the shaft to meet this upraise. The shaft is down 72 feet and the upraise is up 200 feet. Drifting south on the 825 level and upraising in ore on the 1150.

BELCHER.—The 500 level east crosscut is now in 193 feet, having advanced 23 feet during the week. The last 10 feet was in clay and quartz, yielding fair assays. The face is now in a clay which pitches east, and is running north of east.

ALPHA AND EXCHEQUER.—Are working on the 422 and 222 levels of Exchequer, and on the 382 level of Alpha. Are chambering for a winze 100 feet north of the Alpha shaft, where there is a good prospect for ore.

CHALLENGE.—The joint Jacket-Challenge north drift on the 1000 level is in 147 feet, 61 feet having been added during the week. This drift is now within 45 feet of the Jacket north line.

BULLION.—The steam engine to hoist from the winze on the 500 level has arrived and been put in place, and work commenced in the winze with steam-power.

BALTIMORE.—Are in the vein at two points on the 350 level. The water is being handled from the northwest drift, and are prosecuting the work in the north drift.

ANDES.—Drifting a little north of east on the 350 level, and north on the 240. This upper drift has some good quartz coming in.

IOWA.—The McBee tunnel has been advanced 10 feet during the week, putting through some favorable-looking quartz and clay seams.

GOULD AND CURRY.—Have extracted during the week 150 tons of fair-grade milling ore, which has been stored in drifts in the mine.

CONFIDENCE.—Are now shipping 150 tons of ore daily to the Brunswick mill, of an average value as per pulp samples of \$38.97 per ton.

WEST CON. CAL.-VA.—Making favorable progress in sinking the shaft, which has just entered the vein. The material assays moderately.

SEGREGATED BELCHER.—The south lateral drift is now in 266 feet, having advanced 16 feet during the week.

YELLOW JACKET.—Are shipping 100 tons of white rock (gold ore) daily to the Santiago mill.

POTOSI.—The south drift on the 550 level is in 341 feet. The face is in quartz, giving low assays.

LADY WASHINGTON.—Upraising on the 725 level, and are now up about 200 feet.

## Central District.

RICH ORE.—Silver State, March 30: Charley Wright and Nicky Gill are mining the Golden Age lead, and are extracting exceedingly rich ore, some of which is worth a dollar a pound. We hope they will find a bonanza, so that Charley can run for United States Senator and Colonel Gill for Congressman.

## Union District.

LOOKING WELL.—Belmont Courier, March 28: The mines of Shamrock canyon, Union district, Nye county, are looking well and producing ore of sufficient richness to pay for shipment and reduction and then leave a handsome margin of profit for the extractors. Ores of gold, silver, copper and

antimony abound in this district. Capital is wanted to open and work these bodies of ore. The mines of Union district will pay dividends as soon as they are understandingly handled by parties who have sufficient money to work them below the grass roots.

## Eureka District.

ORE SHIPMENTS.—Eureka Sentinel, March 31: During the past week ore shipments were made from the mines of the district as follows: To the Eureka Con.—Jackson mine, 60 tons; Silver Lick, 2 tons; Rescue mine, 16 tons; Marguerite, 45 tons, and Gen. Lee, 3 tons. To the Richmond—Bullwhacker mine, 20 tons; Jackson, 33 tons; Gen. Lee, 1½ tons; Williamsburg, 6 tons.

TO START UP.—It is a sure thing that both the Richmond and Eureka Con. will start up their furnaces as soon as the roads are in condition to haul ore over them.

## Hawthorne District.

GOLD BAR.—Esmeralda News, March 31: D. Tobino, the owner, was out to take a view of his Gold Bar mine. He has but two men engaged in working the claim, although in time past he has had his mine considerably opened. A few days ago A. Martinez cut a vein of very rich ore on the claim, which promises to be another Panlico. Now that the claim is known to be very rich there is a dispute about it which may develop into a lawsuit.

PANLICO MINE.—S. A. Knapp, Jr., brought one sack of ore weighing 135 pounds from the Panlico last Tuesday that is valued at \$10,000. He has six sacks from the same mine worth \$1000 each and 18 tons on the dump at the mine worth \$400 per ton. How is that for rich ore?

## Northumberland District.

A RECENT STRIKE.—Belmont Courier, March 28: Adams, Brewer & Co.'s mine continues to look well as work progresses. An assay made by County School Superintendent Geo. Nicholl gives 384,999 ounces in silver, valued at \$497.76 per ton. This is one of the oldest districts in the county, and this recent strike is very encouraging to the prospectors who have done so much deadwork on this property.

## Pioche District.

RESUMED WORK.—Pioche Record, March 28: Mr. S. T. Godbe, who came in Tuesday, immediately began operations for the resumption of work on the Yuba mine, and from him we learn that the first work done will be to retimber a portion of the shaft and to drift on the 10th level to fully explore the ore body discovered there during the working of the mine last fall. Only so much ore will be hoisted as is necessary to allow work to be freely done; the bulk of it will be allowed to remain in place until transportation facilities become better, which, from present appearances, will be no great length of time. About 15 men will be employed at first and others will be added as the work progresses.

## Stafford District.

THE PALISADE MINING CO.—Eureka Sentinel, March 31: The Sentinel is glad to be able to announce that there is to be a revival of mining operations at Stafford district, in this county, with the opening of spring. Mr. Kelly of San Jose having rid himself of all litigation and conflicting interests in the Onondago property, has revamped it on a sound basis and will begin vigorous operations as soon as the weather will permit. He has changed the name of the company from the Onondago to the Palisade Mining Co. He has a strong company of San Francisco men and plenty of money in the treasury to prosecute the work of development. George Obriter is to be superintendent. Following are the directors of the new company: Wm. H. Sharp, President; Peter Hopkins, Vice President; L. Sissinvine, Wm. T. O'Neil, J. L. Radovich. We are assured that thorough and systematic work is to be inaugurated and carried forward in this promising camp by the Humboldt. Supt. Obriter is expected up by April 10th, if not sooner. We shall expect good reports from the operations of the new company almost from the start. The Onondago has yielded a good deal of rich ore in the past, and well-informed mining men believe that it only needs the expenditure of a little capital and labor to make it permanently productive.

## ARIZONA.

CLARK'S NEW COPPER DEAL.—Butte Inter-Mountain, March 28: Mr. W. A. Clark, who is just home from New York, was interviewed to-day by a reporter concerning the reported purchase by him of copper mines in Arizona. "Yes," he said, "I have made a deal for some copper properties down there, in north Arizona and New Mexico. I didn't buy them, however, as I see it was reported, but leased them for two years. I have an arrangement, though, practically for the purchase of the Arizona mines, but am not at liberty to give the details." Continuing, Mr. Clark said that the Arizona properties leased by him are known as the United Verde mines. There are some eight or ten in the group. They were worked quite extensively in 1883-4, but not much since. The San Pedro mine is the name of the New Mexico property. The United Verde group show plenty of ore of good grade. There is a smelting plant of about 100 tons capacity on the mine. Mr. Clark says his product here will be about 25 block copper and the balance high-grade matte. It is 24 miles over a rough road to the railway, which will somewhat cut down the profits, but with the present prices there is good money in it. He may decide to increase the capacity of the works. The San Pedro, the New Mexico property, is a peculiar mine, he says. It is both a copper mine and a free-gold quartz mine all in one. There is a 25-stamp mill on the ground to treat the gold quartz and smelting works of 70 tons capacity per day to treat the copper ore. The location is about 40 miles east of Albuquerque and some 10 miles east of a railroad. He has simply a two-years' lease upon this mine.

## COLORADO.

THE LEADVILLE MINES.—Herald-Democrat, Mar. 30: The El Paso shaft is showing up some good ore. The water company has been draining the Miami shaft. The Continental Chief is shipping largely just at present. Some ore is being extracted from the Bohn shaft on the Matchless. It is stated that the iron shipment has increased noticeably within the past week. Work on the Jo Davis is progress-

ing well and some good minera being developed. Mr. Shinn of the Silver Cord Shinn lease reports a very satisfactory outlook for a rich strike. Most favorable reports come from the Argo shaft in Big Evans gulch. Work is being pushed rapidly. There are good indications of a large body of ore at the Lee, and the company is pushing rapidly into new territory. Work on the Lucy L., in Tennessee Park, is to be resumed. The Arkansas valley has four furnaces in blast at present, the Harrison Reduction Works four also, and the Manville two. Good reports come from the Silver Cord. Manager Blow states that there are the most favorable indications. Increased shipments are being made from the Olive Branch. Several cars of the most promising ore were shipped to the Argo smelter yesterday. The Minnie and A. Y. mines are working with full forces now. Some very good shipments have been made to the American smelter during the past week.

## DAKOTA.

GALENA.—Deadwood Pioneer, March 29: Talk of blowing in the Galena smelter is revived. Mine-owners claim that sufficient ore can be supplied to keep the plant running indefinitely, and are eager to have fires started in its furnaces. It is unofficially announced that this will be done not later than May 1st, when roads, it is hoped, will be in somewhat better condition than at present. Rumor has it that the German syndicate with which Prof. Weinberg is negotiating proposes to put up large works in the district, in the event it makes purchases of the mines now under consideration.

GOLD PLACERS.—The gold placers of Castle creek are attracting considerable attention, and may cut quite a figure in the more rapid development of the southern hills. A gentleman reaching Rapid therefrom a few days ago had with him \$26, which, says the Republican, he has obtained by panning while prospecting.

## IDAHO.

THE MARTIN.—Challis Messenger, March 30: The Martin joins the Barton on the north. Two-thirds of it is owned by Messrs. Taylor & Salisbury and the other third by Eugene McCarty. No great amount of development work has been done on this property, but sufficient has been done to know that it is another Jarvis or Barton, and that the dip of the vein, character of ore, etc., are exactly the same. It was not visited this time, however, as no work is being done at present.

THE HOOSIER.—The Hoosier is next in order and joins the Martin on the north. The Hoosier, although undoubtedly on the same vein, is entirely different from the three claims south. The dip is to the east at an angle of 15 to 20 degrees. The high-grade ore is gray copper, and the concentrating ore, or low grade, sulphide of iron. It carries besides a peculiar ore, about 30 per cent of which is sulphur, which will ignite in the blaze of a candle and burn freely. The property has been purchased by C. E. Taylor for himself and O. J. Salisbury for \$12,000. They have out 100 tons first-class ore running from 150 to 750 ounces silver and averaging 25 per cent copper—about 200 tons second-class ore averaging 50 ounces silver and 10 per cent copper per ton—about 1000 tons of concentrating ore assaying 24 ounces in silver per ton, of which they expect to save 75 to 80 per cent.

SILVER MOUNTAIN.—Idaho Statesman, March 30: Mr. J. M. Hurst is in from Silver Mountain district. He arrived here on Wednesday, the 25th inst. He has been at work in Silver Mountain all winter. He reports that work has progressed there in good shape. The work on the mine has been suspended for want of an orehouse to store the ore, but there is no discount on the mine; it is rich ore and plenty of it. They will build an orehouse to store the ore in and resume taking out ore. There are about 60 men at work on the mill building. No men need to go in until provisions can be hauled in, as they have only enough for the men who are already there.

## MONTANA.

ANACONDA.—Inter-Mountain, March 29: A frame building 260 feet long by 70 feet wide, with a wing 78 feet long by 56 feet wide, with an addition of 125 feet to the tankhouse, are to be erected immediately at the upper works of the Anaconda Smelting Co. The company has advertised asking for sealed tenders for furnishing all the necessary labor. The Anaconda Fire Clay Co. has been offered by outside parties a contract to furnish 1,500,000 bricks. They have taken the proposition under advisement and will probably take the contract.

A FALSE REPORT.—It is now denied on authority of Manager Pardee that there is any truth in the claim of the granite vein having been struck in West Granite ground. The report was apparently started in St. Louis to boom the stock. The Mail of Phillipsburg says: A little excitement exists concerning the property throughout the camp and vicinity, but this is probably due to nothing more than the fact that the Butte crosscut is rapidly and constantly approaching a country in which developments of the most important nature may at any time be expected.

## NEW MEXICO.

FROM VARIOUS CAMPS.—Lordsburg Liberal, March 31: A carload of mill timbers arrived this week for the American Mining Co. John Boucher has ordered an assaying outfit and will soon be prepared to tell any one what he has got. The Ruby Co., at Gold Hill, has a force of men at work on its property. The company wants to know how it looks 200 feet down. The Peerless property is to be sold at El Paso to-day by the trustee. Con. Ryan is working on the Cashman mine and is having his ore tested at El Paso. It runs about 40 per cent lead, and the silver it contains will pay for the transportation and treatment, and leave him a good profit, according to assay value. Frank Reno, owner of the Robert E. Lee mine, in the Pyramid district, is having a quantity of his ore concentrated by the Gipsy Queen mill with satisfactory results. This mill is now being run by Gammon & McNichols, under a lease, and is in fine shape and is doing excellent work. Superintendent Longmaid of the Carlisle Co. reports that with economy in the use of water, he is able to keep 60 stamps dropping day and night

with results in the shape of but- tlely satisfactory to the com- the Bachelor mine at Stein's Pa- the ledge on their south ground a wide, of excellent ore, a great dea free gold.

COOK'S PEAK.—Kingston Shaft, camp is looking up. When the smel- here lead ore was hauled from Cook's El Paso Smelting Works now have 30 at work on three claims they have bonded. Two years ago three men constituted the camp at Cook's peak, now about 50 men are at work. The ore is hauled 12 miles to Florida station, on the A. T. & S. F. R. R., 15 miles east of Deming, at a cost of \$3 per ton. J. J. Purcell and Frank Thurnmond are interested down there in the Jay Bird and the Fat Man. Purcell is working the Jay Bird and taking out ore that runs 20 ounces in silver and 66 per cent lead, and as the El Paso smelter pays about 60 cents per unit, this makes the ore worth about \$60 per ton. Col. Woodhall has a bond and lease on the Fat Man. McDaniel & Carpenter are starting a small force to work on the Superior. Oliver Teal has the Summit bonded for \$5000.

BONANZA HILL.—Kingston Shaft, March 28: We have mines on the Bonanza Hill and both north and south in lime and in porphyry—to speak in general terms—with great banks or mountains of granite on the west, constituting the Black Range of mountains, which seem to have pushed up through the lime, leaving the mineral deposits on either side, for on the other side of the range is lime with larger deposits of mineral than on this side, although not as rich as far developed. This applies only to the immediate vicinity of Kingston, both north and south.

## OREGON.

ONION AND SILVER CREEK MINES.—Bedrock Democrat, March 25: Our reporter yesterday met in the city Mr. John Cabell, an extensive mine-owner of Granite mining district. First, Mr. Cabell spoke of the mining property of Mr. Ike Klopp, on Onion creek. Two tunnels have been run on the Klopp mine during the winter just past, No. 1 about 150 feet and No. 2, 130 feet. In both tunnels the ore vein has been cut and is from 2½ to 3 feet in width. The ore is free milling and of good shipping quality. One and a half miles east of Onion creek Mr. Klopp is doing development work on the Ajax, from which he is getting some very rich gold ore. Mr. Klopp, as well as our other miners, will ship his ore to Denver for reduction. Two miles above the Klopp claim on the head of Onion creek, and adjoining the La Bellevue, Garrison & Co. have struck a body of high-grade sulphuretted shipping ore at a vertical depth of about 140 feet. They have developed an ore body 300 feet in length, averaging 3 feet in width. This company are now making preparations to ship ore throughout the summer. The La Bellevue, the property of the Cabell Bros., is showing up far in excess of anticipations. The past winter's development work has been diligently prosecuted on both sides of Cabell mountain. On the southwest side we have run through 150 feet of shipping ore, in width from 3 to 5 feet. We have on the dump over 100 tons of shipping ore. Will ship first early in May and continue through the season. On the northeast side of the same vein the ledge has been cut at a depth of 130 feet, showing vein about three feet wide; all first-class ore. From where the tunnel is situated on northeast side of vein to the location of tunnel on southwest side of vein is a distance of about 100 feet, which demonstrates almost to a certainty that the vein is continuous. The mines in general throughout the district are looking well, better than at any previous time. Adjoining Granite mining district on the east is Silver creek mining district. The mines of this district have been developed throughout the winter, and as a rule, look very encouraging. Take our section as it at present appears, and I can truthfully say that I never have seen as favorable a showing before, and I have had many years' experience as a miner.

## TEXAS.

SMELTING WORKS.—Rio Grande Republican, March 25: The International Smelting Works of El Paso commenced operations last Tuesday. The furnace is of the Frazer & Chalmers make, of 40 tons capacity, and C. C. Fitzgerald is the owner. The Bennett mine at Organ furnished the first charge, and the blow-in was entirely successful.

## UTAH.

SILVER REEF.—Cor. Pioche Record, March 28: The river-mill, which for the past two months has been running on custom ores, closed for repairs the early part of the week, but will start up again shortly, we understand, upon ore from the Duffin mine.

LEACHING WORKS.—There is some talk of starting up the Ventura leaching works again. These works are of 50 tons capacity per day. Although we have no confidence in the leaching process, we are satisfied, now that the works are complete, and can be started with very little or no expense, that with proper management they can be made to yield a fairly good profit, provided that 12-ounce ore, of which there is an abundance in this camp, can be procured.

PARK NOTES.—Record, March 31: W. H. Van Alstine has taken a contract to drive the Wasatch tunnel 500 feet further into the hill, and the work was commenced Thursday last. The Wasatch tunnel has many tons of good ore on the dump now, and with the completion of this new contract it should show up as a paying property. A number of men at the Daly have been laid off till the roads become solid enough for wagoning. Many hundreds of tons of ore are housed up at the mine, and if more be taken out there is no convenient place to store it. Several Ontario miners have been laid off temporarily for the same reason.

ORE AND BULLION SHIPMENTS.—During the week the Crescent shipped 90,000 pounds of first-class ore. Owing to bad roads the Ontario, Daly and Sampson are not shipping ore at present. The shipments of Daly bullion from the Marsac mill are as follows: March 25th, 10 bars, 11,047 fine ounces of silver; 28th, 10 bars, 11,022 fine ounces, and to-day the product will be 12 bars. The Ontario is making another bullion shipment.

# FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

## FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco.  
HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

## THE PELTON WATER WHEEL

Gives the highest efficiency of any Wheel in the world, and is everywhere recognized as the standard for high pressure service.

### UPWARDS OF 500 IN USE.

From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the country.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Hoisting, Pumping, or any other purpose where water power can be used.

### ELECTRICAL TRANSMISSION.

Power from these Wheels can be transmitted by electricity several miles with small loss, and made available for running Mills, Pumping and Hoisting Works, Trams, cars, etc. Address

The Pelton Water Wheel Co.,  
127 FIRST ST., SAN FRANCISCO, CAL.

Practical Treatise on Hydraulic Mining.  
By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-rurdy, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dewey & Co., Publishers, 252 Market St., San Francisco.

## THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works.  
Sole Manufacturers,  
227 First Street. San Francisco, Cal.

FOR SEVENTY-FIVE DOLLARS THIS College instructs in Shorthand, Type Writing, Book-keeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for six full months. We have sixteen teachers, and give individual instruction to all our pupils. Our school has its graduates in every part of the State.

Send for Circular. E. P. HEALD, President.  
C. S. HALEY, Secretary.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

# JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

### "HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Min. D. C. WICKHAM, Taylor Mine, Greenwood, Cal.  
ing Co., Amador City, Cal. J. R. TREGLOAN, Supt. South Spring Hill Gold  
W. G. ROBERTS, Greenwood, El Dorado Co., Cal. Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,  
And will furnish descriptive Catalogues and quote prices upon application.

## IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS, with lever attachment, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under a decision of Sawyer, Judge of the U. S. Circuit Court, in the case of Hendy and Fisher vs. R. Hoskin et al.

We also manufacture the Single-Jointed Giants.

Prices and Catalogues of Hydraulic Mining Machinery furnished upon application.

JOSHUA HENDY MACHINE WORKS,  
39 to 51 Fremont St., San Francisco, Cal.

This cut represents our

IMPROVED  
HYDRAULIC  
MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

HOSKIN & CO., Marysville, Cal.

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and  
high heads are utilized, and are guaranteed to give more power with less water than  
any other wheel made. Being placed on horizontal shaft, the power is transmitted  
direct to shafting by belts, dispensing with gearing.  
Estimates furnished on application for wheels specially built and adapted in  
capacity to suit any particular case.  
Further information can be obtained of this form of construction, as well as the  
ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost,  
by applying to the manufacturers.

# THE RAND DRILL COMPANY,

23 PARK PLACE, NEW YORK,

Are now so situated with their new works as to offer to the miners of the Pacific Coast small Air Compressing Plants at such prices that almost any small mine can afford to put in power drills if they have none in use.

By their new and patented systems (by which the duty or performance of drills is not reduced with use) it is no longer necessary to buy a compressor of double capacity than the drills are expected to require, in order to keep up the supply of air necessary on account of the wear of drills and compressor.

Besides having the newest and lightest designed small drill plants, the Rand Drill Company, as is well known, has built, and is now building, the largest Compressor plants in this country, and has patterns for all sizes up to 40-inch diameter of cylinder.

In respect to capacity in speed of drilling, perhaps it is in order to say that in every authoritative contest for speed yet initiated, the Rand Drills have, without exception, been victorious. This fact, coupled with another important one, that the drills use much less air and cause less repairs, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained them from the California market no longer exist, they are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor now being built for the Anaconda mine in Montana.

Patent Agency.

ESTABLISHED 1883.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us offer to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St. S. F.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

Send for Circulars and Price List.

## THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

## AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

### Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

**RANKIN, BRAYTON & CO.,**  
BUILDERS OF...  
**MINING MACHINERY.**

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

**PLANTS FOR GOLD AND SILVER MILLS,** embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

## THE HAZELTON BOILER.

A NEW AND RADICAL DEPARTURE IN  
**STEAM GENERATOR.**

DESTINED TO REVOLUTIONIZE ALL FORMER METHODS. A SAVING IN FUEL OF AT LEAST 25 PER CENT GUARANTEED OVER ANY OTHER STYLE OF BOILER.

The following parties have these Boilers in use or under construction on this Coast, to whom reference is made:

Spring Valley Water Works, S. F.	1 200 H. P.	Starr & Co. Mills, Wheatport.	1 100 H. P.	San Jose & Santa Clara Electric R. Co.	1 100 H. P.
Southern Pacific R. R. Co., S. F.	1 75 H. P.	Selby Smelting Works, Vallejo Junction.	2 125 H. P.	San Diego Electric R. R. Co.	1 100 H. P.
California Cotton Mills, East Oakland.	1 150 H. P.	Selby Smelting Works, Vallejo Junction.	1 75 H. P.	Los Angeles Electric R. R. Co.	1 100 H. P.
Harmony Borax Mining Company, Alameda.	1 75 H. P.	Oakland Gas Light Co., Oakland.	1 200 H. P.	La Luz Mining Co., Mexico.	3 75 H. P.

## Building Roads and Pavements.

Among the first things the ancient Romans did after conquering a new country was to make good roads so that they could quickly and expeditiously transport their armies and munitions of war. How well they succeeded can be seen to the present day in some Roman roads that are still in existence. It has been found by people who have made the subject of roads a life-long study, that the secret of their permanency is a good foundation. Without a good foundation, it is foolishness to expect to get anything to stand the wear and tear that modern roads have to stand. It is necessary first to get a good, solid, unyielding base on which to build the roadbed, and lay on the upper crust of granite, basalt, gravel, or bituminous rock.

The machine which is illustrated in this week's PRESS is one that is being introduced by our enterprising citizen, J. B. Jardine of the Atlas Iron Works, to meet certain requirements in road making, especially in the rural districts, where sometimes in the rainy season it is impossible to move an empty wagon, on account of the poor condition of the county highways, which are often little better than mud-puddles in winter and dust-bins during the hot, dry summer. In fact, many California roads are a standing joke and disgrace to the State. The people of the Eastern States have been long alive to the benefits of good roads, and in Europe the greatest attention is paid to the subject. The "Queen's highway" between London and Glasgow, 455 miles long, is kept in just as good condition over its entire length as our beautiful drives in the Golden Gate Park, and that through the agency of just such a machine as we illustrate this week. What a splendid city we will have when our city fathers wake up to the fact that bituminous-paved streets are better than cobblestones if rolled and compacted by a machine like that illustrated. Great sanitary benefits are to be derived from streets that can be kept clean and free from dust, which blows in our eyes, ears, and nostrils in summer and clogs up our sewers in the winter. The cobblestones and poor roads break our axles and lame our horses. This could all be remedied if the people would avail themselves of our natural substances, which are so abundant, and the mechanical talent at hand. This city alone ought to own three or four such machines, and should compel all contractors to have their work well compacted by rolling before they lay down a

single basalt block or crosswalk flag. These machines are made in all sizes, from 3 to 20 tons in weight, and can be easily handled. One of these machines (in fact the subject of our photo-litho) has just completed Golden Gate avenue, a drive that is a pleasure to ride over, besides being a credit to our city. They are in use in San Diego, Los Angeles, Santa Barbara, San Jose; but the Queen City of the Pacific Coast is now without a modern machine to roll its hundreds of miles of streets, which are sadly in need of its friendly pressure. No

WATER-WHEEL FOR LOW HEAD.—Summer Shaw of Boston, now in this city, has a form of water-wheel of novel construction, which it is his intention to apply in places where there is a small body of running water with low head. The wheel is composed of a hub secured to a spindle, and an annular ring secured to the hub by radial rods or wires, to which are hinged a series of wings or blades. These wings or blades fill the space between the annular rim and the hub, and swing freely, though the swinging motion is limited to a certain space

## A Prize for Water-Power System.

The City of Buffalo is about to offer a prize of \$100,000 to the inventive ingenuity of the world for the discovery or invention of the best system for utilizing in the most practical manner the immense water-power of the river at or near Buffalo. The money has all been subscribed, but is yet to be collected. When this is completed and the subscribers organize they will reply to all inquiries as to technical requirements. The circulars giving this information are signed by James B. Stafford & Bro. of Buffalo. It must be remembered that this does not refer in any way to the water-power derived from Niagara Falls (22 miles from the city), but for utilizing the principal current of the river at or near Buffalo.

The city has a water-front of about five miles, running 2½ miles along the shore of the lake and 2½ miles along the Niagara river. The position of the city gives it great commercial importance, and its manufacturing interests are extensive. There are 30 or 40 large iron-manufacturing enterprises among others. The leading establishments are blast-furnaces, rolling-mills, foundries, breweries, tanneries, manufacturing of agricultural implements and flour-mills. The coal trade is enormous.

It is reasonable to suppose that some of our California inventors may compete for this prize. In the mining regions of this State many problems for the utilization of water-power have been worked out in working hydraulic mines, quartz claims, and especially river-bed diggings. The big ditches and flumes have furnished power for removing seepage-water, etc. Of course the conditions are different in the case in question, but there is no reason why our inventors should not put on their thinking-caps and try for the prize. There are various well-known methods of utilizing water currents, but doubtless all of these have been already considered and some more practicable one is wanted.

At the Old Dominion Copper Co.'s mine, Arizona, the bins are full of ore and there is a good supply of coke on hand. The new double-compartment shaft has been fitted up with cage, etc. It will greatly facilitate the opening up of new ground.

It is stated that Wm. H. Patton, well known in Nevada, has struck it rich on land adjoining the Bunker Hill mines, 200 miles from Adelaide, Australia. It is a silver property.

ROAD-MAKING MACHINE BUILT BY THE ATLAS IRON WORKS. Neg. #26, 489

wonder the southern cities are booming. They are hiring away the best of our talent, buying our best machinery for sewerage and grading their town and nine mile drives, while we, in this city, sit idly by and wonder what it is all about.

CALIFORNIA MARBLE.—Israel Luce, superintendent of the Inyo Marble Co., who is East in connection with plans to make California marble better known and also to secure machinery to increase the present plant, says that he considers that favorable progress has been made at Washington. He had a conference with the supervising architect, accompanied by Congressman Morrow. The architect said that when specifications are sent out for public buildings on the Pacific Coast, he will include bids on Inyo county marble.

In a quarrel over a mining claim, last Friday, Joseph Shannon was shot and killed near Steamboat Springs, Nev., by Chas. Grappe, who was working the mine with him on shares.

ATTEMPTS were made to form a corner in tin at London, but have been abandoned.

when acted on by the force of the water. It is Mr. Shaw's intention to place several of these wheels on the same shaft, a few feet apart. The series of wheels is then to be placed in a closed box or flume through which the water is led, the wheels occupying nearly the whole space in the box or flume, so that all the water that passes shall act upon them. It is his opinion that by having a series of wheels on the shaft he will utilize a great deal of power that is now wasted in having only one wheel.

IMPORTANT LEAD ORE.—Chief of Special Agents Jewell says that there is no information in the possession of the Treasury of which he is aware to indicate that lead ore is being smuggled in any quantities into the United States from British Columbia or Mexico. Several years ago the question was raised as to the rate of duty to be paid on silver ore containing a large proportion of lead imported into this country. The Treasury decided that the duty should be paid at the rate fixed on the article of chief component value in the ore. If it contained more lead than silver, it was to pay the duties fixed on lead, and vice versa.

## CORRESPONDENCE.

We admit, undorsed, opinions of correspondents.—EDS.

## The Proposed Obliteration of Idaho.

EDITORS PRESS:—The PRESS has already more than once taken occasion to object to the proposed dismemberment of Idaho Territory, a project that until recently we supposed had been abandoned, not so much because of what we had written against it as because of its obvious impolicy. After suffering it to rest for some time, William M. Stewart of Nevada, the author and staunchest advocate of this measure, has again called it up in the United States Senate, through which branch of Congress he is endeavoring to push it with his well-known ability and energy.

We do not at this time recur to this subject with the purpose of reproducing the arguments already employed by us in its discussion, but to simply advance one objection not before urged by us, to wit, the extent to which this extinction of Idaho, if finally effected, will reduce the representation of the Pacific Coast in the United States Congress. Consummated, and this measure wipes out another prospective member from the Pacific group of States, at best none too large in view of the preponderance of the Eastern States in the legislative halls and councils of the nation. To deal with Idaho in the manner suggested by Senator Stewart would be to expunge her from the map of the United States, for once severed and annexed to her neighbors, she could never be territorially restored. Her very name would be obliterated, there being nothing left to which it could be applied. The Congress will be willing to consign one of our fairest and most promising political subdivisions to such a fate, we do not believe. There is not in the great Northwest another Territory enjoying a higher prosperity or having before it a more brilliant future than this which it is now proposed to cut up and forever blot out.

Idaho will in a short time have population enough to warrant her admission to the Union. As regards natural resources and already created wealth, she might even now aspire to that position with as much reason as did some of her neighbors who have long enjoyed that distinction. As far as population is concerned, there would be more sense in annexing Nevada to Idaho than in the reverse of such proposition. Better, however, that the boundaries of both remain as they are, neither being wanting in the elements necessary to the successful maintenance of statehood.

We are not a little surprised that a man so noted for sound business sense as is Senator Stewart should have made himself so conspicuous in this movement, which we can hardly believe meets with the approval of his judgment. His course is best explained perhaps on the supposition of a too great desire to carry out the wish of his constituents and aggrandize his own State. While the honorable gentleman may have spared severe censure for this, it is still the duty of the public press to inquire after and care for the interests of the country at large. We hope to see this measure meet in the United States Senate with the condemnation under which it so justly end so generally rests on the Pacific Coast.

H. D.

## One of Montana's Gold Mines.

## The Empire Mining Co. Limited.

EDITORS PRESS:—This company was organized in London nearly two years ago, with a capital stock of 100,000 shares at £1 per share.

The first property acquired by them was the old Whippoorwill mine and mill and the Empire. These properties are located six miles from Marysville, Lewis and Clarke county, Montana, by the wagon-road via Gloeter, but in a direct line over the divide not over three miles west of Marysville. The Whippoorwill property had an old-style 10-stamp mill, in which the ore down to the water level had been worked in the usual crude manner, not saving a very high percentage. It was, however, rich enough to pay, but when water was struck in such quantities that it could not be handled by the old bucket process, the mine was shut down as worthless. The same parties owned the Empire, and, having a good showing at some two or three different points where the vein had been opened, the sale was made that caused the organizing of the Empire Co., with a paid-up capital of nearly half a million dollars. They selected Frank L. Sizer as resident manager. Operations were at once begun to open the Empire vein. To systematically satisfy themselves of the magnitude of their property, five stamps were added to the old plant and results carefully watched. At the same time a tunnel was started to connect with the Whippoorwill. This, when completed, will be 1200 feet in length, and will tap that property at 150 feet below the old workings. It was a gigantic undertaking, as it was through the hardest kind of formation, but at the time of my visit they expected to reach the ledge by the 10th of this March. Should the opening of the Whippoorwill reach their anticipations, they will have a very bright future ahead of them, in the fact that regular dividends will be assured.

The first work of this company was done in

May, 1886. During the 12 months following the manager was able to satisfy his company of the permanency of their property to such an extent that a new mill was decided upon, as the old one at best was a "clap-net" affair, and a new 40 stamp mill was decided upon. That old veteran huilder, Tom Fisher, was called in and given charge of the improvements. Mr. Fisher has superintended several of the best plants that have been erected in this Territory, and in every case has done himself great credit, and as this is the last, has had the advantage of all his former experience.

The company decided to make it a 60-stamp mill with every convenience known to modern mill-building, to simplify and reduce the expense of handling and reducing ore.

The ore is dropped from the mouth of the tunnel by tramway to the mill, and on its arrival there is dropped automatically to the rock-breakers, and from there to the Challenge ore-feeders to the stamps, and thence over the plates to the vanner-room, where the tailings are concentrated by 24 Frue vanners. After this there would seem to be but little chance for any value to remain. The ore bins at the mill have a capacity of 2500 tons, and the bins at the mine half as much more. During the past year they have run nearly 6000 feet of levels and have developed the Empire to the 425-foot level, where they find they have a large body of free ore running from 10 to 16 feet in width that will average from \$15 to \$20 per ton. An ore chute of this size makes tons of ore very rapidly. They have the cost of mining and milling reduced to a minimum. The total expense of mining, milling, tramway, office expense and percentage of wear and tear of machinery does not amount to \$4 per ton. This, with the large bodies opened on their lower levels and the prospects that were known to exist in the Whippoorwill when work was stopped on account of water, will render dividends in the future almost compulsory. Quite a town has built up around the mill and mine. Probably 500 or 600 people are now residing in the vicinity and gaining a living from the Empire in one way and another. Already the company have paid two dividends aggregating over \$70,000, and a third will be declared before the mine will have been in operation two years. This ought to be a fair showing for the investors and a handsome interest on the amount of cash invested.

Frank L. Sizer has conservatively looked after the interests of the Empire Co. ever since its inception, and from appearances is fully alive to the interests of the company at all times. Wm. Catron, the mining foreman, is also a man of extended experience, having filed the same office on other properties, and is giving the Empire Co. the full benefit of his years' experience.

## Mining Accidents.

John H. Sullivan, a miner engaged in the Hale and Norcross, working in a drift that connects the north and south upraises 115 feet above the track floor of the 700-level, was caved on last week by a heavy mass of earth, and died from the effects of his injuries almost as soon as extricated.

A few minutes before this cave occurred there was a slight cave at about 80 feet from that point, which knocked down a man named James Sullivan. James, not feeling well from his injuries, concluded to go on top, and while he was being rubbed around the shoulders, where he was hurt, the cave occurred on John Sullivan.

The two Sullivans have been working partners in the Hale and Norcross about four months. John Sullivan was a man of splendid physique, standing about six feet in his stockings. He was a native of Canada, aged 43 years, and has been on the Comstock about 20 years. He was a very quiet man and well liked by all who knew him.

On the following day a premature explosion of a blast in the stopes, about 60 feet above the 700 level of the Hale and Norcross, literally filled James Cavanaugh with fragments of rock. After the accident Mr. Cavanaugh climbed down 60 feet of ladder to the 700-level, walked to the shaft, and after being hoisted to the surface walked into the office of the foreman. He was very badly hurt but will recover, none of the missiles having penetrated the bowels.

A fatal accident occurred in the Kennedy mine near Jackson, Amador county, by which the skip-tender, William Richards, a young man about 26 years of age, and a native of Cornwall, England, instantly lost his life. The unfortunate man was at the 740-foot level, and by some means fell to the bottom of the shaft, a distance of 200 feet.

It is thought that the explosion in the Rich Hill coal mine, near Kansas City, by which 30 men lost their lives, was caused by natural gas.

J. G. LEMMON and Mrs. Lemmon have been appointed botanist and artist to the Board of Forestry. Mr. Lemmon has been supplied with photographic appliances, and will start immediately to investigate the habits and growth of the forest trees of California. He will also gather data of the flora, and Mrs. Lemmon will make drawings and sketches. This information, when obtained, will be incorporated in the board's annual report. This work has been found necessary, as no book and very little reliable information can be readily obtained.

## The Drumlummon.

[From our Correspondent, R. G. HUSTON.]

Montana Co. Limited, an old and tried company, are still operating their mine and plant in their usual live and active manner. Their 120 stamps have been constantly dropping during the last 12 months, with only an occasional cessation long enough to clean up.

Their production for the year 1887 was a little over \$2,000,000. This amount with an average expense account of about \$60,000 per month, leaves a very handsome margin for stockholders, and although the production fell off in the last two months of '87, no apprehensions need be felt of the future of the mine.

The reserves of high-grade ore may not be as large as one year ago, yet ample is in sight to keep the Drumlummon plant operating to its full capacity for years. They are now sinking and cutting out stations at each 100 feet, and running levels to tap the different ore chutes to keep a sufficient amount of ore in sight to supply their ore bins in future. At the time of my visit they were about 50 feet below the 800-foot level, and ere this at the rate they were then sinking they have reached the 900. Levels have been run I might almost say by the mile during the past year, and each one developed at the usual points. The ore chute as found in the upper levels is in some places larger, in others smaller, but with only the usual variation looked for in mining.

One very singular circumstance is the finding of a very large body of oxidized ore on the 800-foot level in an ore chute that at the 400-foot level was very base. This is one of those freaks of nature that we sometimes find and are unable to furnish a satisfactory solution for.

The Montana Co. are still operating their mine and works on the basis of good pay for good work, and "spend your money where your own sweat will may lead you"—a disposition that I can most heartily commend. I believe that any company can get better service from employees to whom it accords the privileges of a free agent than when it presumes to say to them where they shall live or buy their goods.

The insurance company that they were about organizing when I was there one year ago has been a success, and all are highly pleased with its management and the benefits accruing. The company have been very liberal in their connection with this institution, as for every dollar that is paid into the treasury by employees they contribute a like amount. This makes it almost worth a small premium to be in the employ of the Drumlummon Co. They are careful in the most minute particulars that everything around their works shall be absolutely safe so far as it can be made, and against accidents unforeseen they have fostered this insurance until every man is insured for \$1000. Accidental insurance in case of death, and indemnity in case of being hurt.

In the way of supplies they purchase everything in quantities. That makes prices very low to them. They have acres of cordwood piled up eight feet high, insuring them against running short in that line. During the past year they have been connected with the outside world by railroad, a branch of the N. P. R. R. being laid from Birdseye Station. It is about as heavy a grade and the most crooked piece of road I have ever traveled over. However, they have a fair service over it and a great improvement over the old wagon travel from Helena.

The Montana Central have a road graded in, but as they did not finish their road to Helena until late in the winter, will not iron their Marysville branch until spring.

The town of Marysville has improved very much in general appearance during the past season. Many houses have been built, and a better class of buildings, showing a more permanent feeling among the residents. The old mining superintendent of the Montana Company, Mr. Henry Bratnaber, has taken a trip to Central and South America this winter for the benefit of his health. He carries with him the best wishee of the management, and all with whom he came in contact, for the speedy recovery of his health.

Manager R. T. Bayliss is still in charge, and so long as he remains there the company's interests will be safe in every particular, as he is devotedly applying his time to securing the general prosperity of the Montana Co.

The production of the Montana Co., it is reported, all goes to Tiffany's establishment in New York on account of its peculiar fitness for his uses in manufacturing, and shows the magnitude of his operating. Over \$2,000,000 in raw material used in one year is a large showing for a manufacturing company.

QUICKSILVER AND AMALGAM.—A correspondent who signs himself "W" writes us as follows: "We have a silver-mill here that runs off some floured quicksilver and amalgam with the tailings. How can they be separated so as to tell the percentage of each and so each can be assayed? Panning won't answer at all."

THE HOUSE COMMITTEE on Mines and Mining have approved the bill amending the Alien land law. The amendment provides that the restrictions of the law shall not apply to mines of gold and silver, tin, lead, cinnabar or copper, or any interest therein.

## The Mines and Miners.

BY PEDRO CASTERA.

(Continued from issue of Jan. 21st.)

[Translated for the PRESS from *El Minero Mexicano* by M. N. M.]

The publication of our story having been unavoidably suspended, we resume it at the point where it will be remembered, the administrator seated on a projecting piece of decayed wood and clinging with bleeding fingers to the rock, heard voices at the mouth of the shaft.

## The Fatal Fall.

The criminal had communicated to the director of the mine his account of the accident, and all the employees had hastened to assist in recovering the body of Don Rafael from the bottom of the tiro. A moment more and he would be saved. His hands were fastened to the rock as if they were of steel, and full of anxiety, he looked up—then closed his eyes, dazzled by the brightness of a *tea* (torch) which was rapidly descending—et that instant a man with his back to him, passed behind and near him. It was the cajonero Jose. He immediately let go his hold of the rock and seized the rope. The force of the movement was such that the stick, with a great creak, broke and fell.

At the noise which it made, the cajonero looked up, and, seeing the administrador, began to blaspheme and to ascend, armed with a ponider, which he carried between his teeth. Separating the two, there was a distance of some 20 varas, and, while Jose was climbing up, Don Rafael quickly fastened himself with the cahallo to the rope, which was shaking dangerously, and balanced himself over the abyss. As the cajonero was impeded by the *tea* he cast it to the bottom of the shaft and all was dark again. When the light was extinguished the melacate (windless) was started in the reverse direction, the employees fearing some new accident, and the cable ascended with vertiginous rapidity. Don Rafael, after securing himself to the rope, drew from his pocket a large cleop-knife, and, reaching beneath him, attempted to cut the rope. In doing so he heard the labored respiration of Jose, who, comprehending the action and its result, accelerated to the utmost his ascent. The administrador went on cutting, but in a feeble manner, the cajonero all the time approaching and a struggle more fearful than the former was about to take place when suddenly the rope broke at the place where it was cut, and Jose, with a cry of horror, fell to the bottom.

When Don Rafael came out, his presence caused no little surprise. He explained all that occurred, except how it happened that in such a short time his hair had changed from a brilliant black color to a silvery white.

## In the Works of the Dolores.

Ten years have passed and still the blood surges again whenever the event which I am about to relate is recalled. It is not a description, however, but only a slight sketch, that I am going to give of what is yet retained in my memory. I was temporarily in control of a mine called Mina Alta de Ajuchitan, situated on the highest part of the highland of the same name near the town of Cayuca, in the State of Guerrero. I do not exaggerate when I say that the heat was suffocating. At sunset it marked 33° Reaumur. In order to escape that torrefaction, I passed the day in the mine, and like certain twilight birds, only went out when the sun could no longer lavish upon me its carcasses. At six o'clock in the evening the night people appeared, numbering 50 paradados or barreteros or it may be 100 men and 20 faeneros. At the same hour, the day people began to go out, and both those entering and going out were intoning that canticle, which is a supreme adios to the light, to the sky and to life, and which they with simplicity call the alabado. The former descended, going to the depth of 400 meters. Their voices became confused and more distant, and soon there was audible only a kind of colossal sigh which issued from depths full of darkness and of dangers. By means of the harretas (small hares of steel), the hammers, the picos (pickaxes), and powder, and by continuous labor, both dangerous and difficult, the hardest rock is pierced, torn asunder, and comminuted. Thus they advance, a few inches in a day, but they advance! The barreteros begin their work, accompanying the noise of their hammer-blows with an ay! ay! ay! It is called singing the harreno, and aids their respiration, while at the same time it conceals their fatigue. In the meantime the placemen engaged in the management assemble, the corks of the champagne bottles pop, and the liquid overflows in waves of snow-white foam, while the men in the mine are expending their sweat and blood. And for what? To gratify the insatiable and stupid thirst for gold. Let us, however, put aside philosophy, which must be vain, and proceed, not inventing but describing.

One night I was at supper with the placemen, when suddenly we were startled by a strange, confused noise, which we were coming from beneath us; that is, from the interior of the mine below. It was a formidable noise. No one moved, notwithstanding we were obliged by the severity of mining discipline; but the faces of all turned pale and the laughter ceased. The noise increased and we comprehended that a

caving was taking place at some unknown depth. Sin novedad! Sin novedad! cried out the sentinels of the patio at intervals of a minute between each alerta (watchword). I gave the key which I had suspended at my belt; the administrador communicated my order to unlock, and immediately after a *mandon de barras* (foreman), pale, blood-stained and almost out of breath from his rapid ascent, said in a tremulous and interrupted voice: There is not, your worship—any more danger—only that—the contracielos—of the Dolores—was falling.

#### The Buried Miners.

It is well, I replied. How many paradás are in it? Ten, and four fieras. How many men have escaped? I inquired. Not one. Twenty barreteros are buried, as work was not begun. Alive or dead? Alive, because they

infinite anguish, hours during which they live years, in which the hair whitens, and when, ignoring all danger, they have thought only of saving the imperiled life of one or more of their companions. I was soon in the works of the Dolores, the roof of which was bulging out. An *abra* (crack) in the roof which is called *contracielo*, had broken the *ad-me* (side timbers) which support it, and was the cause of the noise and of the caving which had cut off communication with the twenty barreteros who were in it. By the crackling light of the torches, more than fifty men, but *men indeed*, of copper-colored complexion, stripped for their labor, bathed with sweat and lacerated by the dropping stones, were at work removing the fallen material, placing props of live oak against the hill, the continued caving of which caused them to break as if they were shingles, and which,

#### Metallurgy of Zinc.

In recent numbers of the PRESS we have given some sketches of zinc furnaces. We give herewith another form of furnace, which Mr. Melville Attwood of this city used some years ago. Mr. Attwood writes as follows:

The calcination or roasting of the ore is done in various forms of furnaces—some having steam jets introduced through the fire bridge.

The Belgian furnace is the most economical, and the charge is worked in one-third of the time taken by the other modes, but the loss is much greater and the spelter produced not so good.

In 1841, in consequence of the failure of spelter works in Derbyshire which owed me a

Put Up by Melville Attwood at the Cheadle Copper and Brass Co., 1844 "

The average yield of the calcined blende for the quarter's working was about 50 per cent of spelter.

At the Cheadle Works they had one of the old calamine brass furnaces, and I tried to substitute calcined blende in the place of the calamine, but it did not succeed—that is, the brass was not so good.

The fine brass buttons of our ancestors were made from calamine brass, and Camorarius says that the Egyptians (long before the Romans) had so great a veneration of brass that they made images of it and laid them in the graves of their kings to preserve their bodies from putrefaction, and to men of lesser quality they nail d their dead bodies with many brass nails.

The improvement in the market for zinc or

AITWOOD'S FURNACE FOR THE DISTILLATION OF ZINC.

hear their cries for succor. O! foot, señores! I said, twenty lives are in danger; let each one do his duty! Let us go! they replied, with one voice, some running to the patio, and others to the interior of the mine. The noise increased; it was now a clamor, and mingling with the screams that were issuing from the mine were the alarfas of the sentinels, and the dismal sounds of the two bells giving the alarm. A few moments afterward all the men, women and children were grouped in the patio, singing the alabado. The children were making beds of leaves for the wounded, the women were preparing lint and bandages, and the men, dragging timber and ropes, disappeared through the dark hole into the mine. While the alabado was being sung, the bells were ringing, the clamor was increasing and the sentinels were still exclaiming "Sin novedad! Sin novedad!"

An hour after there remained in the patio only the sentinels, the administrador and myself. I left him in command, as it was my duty to go into the mine, and I went down. There is no need to draw upon the fancy. The great tragedy is nature. To copy it is sufficient, and the picture is true, even though terrible.

I write this for the miners, for those dear brothers who have passed, as I have, hours of

like an inverted volcano in eruption, was throwing out stones that wounded those who were engaged in the rescue.

(To be Continued.)

THE Martinez Item says the coal mining of the Mt. Diablo coal range is but yet in its infancy, and only awaits the outlay of sufficient amount of capital to reopen and work veins of the black diamonds which will prove of even greater richness and extent than the surface veins which have been worked in the past. There is an underlying coal belt extending from the Nortonville mine at the base of Mount Diablo to a point on the Marsh creek, that in the future will develop astonishing results as far as coal supply is concerned. Today the Pittsburg at Somerville and the Central are being worked and large quantities of the bituminous commodity shipped all over the coast. We must take exception to the broad assumption that California is destitute of this valuable commodity, as Contra Costa claims the proud distinction of having within her borders coal sufficient to afford all the families of California fuel necessary to keep them warm during all the cold winters to come, besides enough to produce steam for her manufacturing and river steamers.

large sum of money for zinc ores, I was obliged to take part of the works for the debt. Their failure arose from not being able to make retorts which would stand the change of temperature when charging them with ore.

After a number of trials, with much hard work and great expense, by mixing a large proportion of burnt clay with the raw, and allowing the mixture to stand some time before using it, I at last succeeded in constructing retorts that would stand the change of temperature and last for from four to five months. I made the first set with my own hands. The drawing which I now give to you shows the great difference in the furnace and retorts I constructed and those in use in other parts of England at that time.

The form of the retort enabled me to produce a very pure metal, and in 1843 I rolled some of it into sheets at the Cheadle Copper and Brass Co.'s Works in Staffordshire. I believe it was the first English-made zinc that was made into rolled sheets. The metal I produced was in great demand, so much so that it induced me to erect, with other partners, besides the four furnaces at Cheadle, eight in Derbyshire and ten in Cumberland.

I see among my old papers one headed "The Quarter's Working of Four Spelter Furnaces

spelter, although not so great as that of copper or tin, has been marked by a steadiness which certainly has been anything but characteristic of either copper or tin. The great and increasing demand of zinc for galvanizing wire alone has consumed a very large quantity of zinc, a very heavy waste of metal being entailed in the operation.

In the accompanying engravings, Fig. 1 represents a vertical cross section through the middle of the furnace, showing position of retorts above the fireplace; Fig. 2, top of furnace; Fig. 3, longitudinal section of furnace; Fig. 4, ground plan; Fig. 5, front view; Fig. 6, section showing how the sides of the retorts are made to form the flues.

## Passing Events.

The miners in the Territories are to be congratulated on the repeal of the Alien Act as far as it relates to mines. They can now sell their mines to any one who wants to buy, irrespective of nationality. The passage of such an Act was of great detriment to the mining interests of the Territories, and we are very glad it has been repealed.

The reported gold discoveries in Lower California may be bona fide and may not. Gold has been known for many years to exist in the localities mentioned, but on the whole peninsula water is more or less scarce. It is not probable that the discoveries will attract more than local attention.

The bullion product of the famous Comstock lode is increasing rapidly. Last month the output was very large. The mines are all being actively worked and are more free from "stock" influences than they have been for years.

An arrangement of great commercial importance has been made public this week, in the announcement that the Canadian Pacific's Co.'s steamship line has made San Francisco its terminal point.

BULLION deposits in the Carson Mint during March exceeded \$200,000, which is more than was received during the first ten months after the opening of the Mint in 1886, and about as much as the refinery is capable of handling.

AN astronomical observatory is to be built at the University of Oregon.

## Free Borax.

It has been asserted that the discovery in this country of any valuable deposit of the useful minerals or metals has invariably been made an excuse for asking Congress to impose a duty on the imported article if on the free list, and to increase the tariff on it if it be already dutiable. Commenting on this fact, a certain class of economists have affected to believe that the finding of such deposit becomes a real misfortune to the country, as tending to enhance the price of the mineral or metal so discovered, as perhaps for the time being it sometimes does. But for all this, the shove is an impolitic and short-sighted view to take of the matter, as the history of the many prosperous industries that have grown out of such discoveries conclusively shows.

To illustrate our position, let us take the case of horax production, a business of recent origin in this country, very little of that salt having been made here prior to 1873. About that time extensive beds of the borates of lime and soda were discovered in Eastern California and Southern Nevada. Though spread over large areas there occurred here comparatively little high-grade material; yet so extravagant were the reports of these new found horax fields sent abroad, that foreign dealers and producers becoming alarmed at once combined to protect themselves against this threatened rival; the crushing out of the latter before it became dangerously strong forming a part of this protective policy.

As a means of reaching the end proposed, a syndicate of English and French interests was formed, immense quantities of the borate of lime from the Turkish deposit near the Sea of Marmora, the richest in the world, were shipped to London and there converted into horax acid, which article was afterwards sent to this country, being here admitted duty free. This movement had the effect intended. Our home companies, unable to compete with the cheap foreign article, after struggling along for several years, were obliged to suspend operations altogether, their works having remained closed for more than a year. At the end of that time, with some improvement in the market, the most of these companies resumed work, though their business languished until Congress came to their relief by placing on the imported commodity the present moderate duties, which, under the new tariff schedule, it is proposed to abolish altogether.

Should this measure prevail, it will have the effect to kill the horax industry on this coast entirely, at least that is what the companies engaged in the business tell us. Through the introduction of many improvements and the observance of an almost niggard economy, working in unison and avoiding an overproduction, these companies have, for the past five years, been able to keep their works going, though their profits have been small, hardly more than the margin covered by the existing tariff. This removed, and their net earnings would be so nearly extinguished that there would be no inducement for them to longer keep the field.

And now let us see what this abandonment of the business would mean: In the first place it would mean an early and marked advance in the price of horax to the American consumer. How great that advance would probably be is best denoted by the price that formerly obtained for this salt, which, up till the time that it began to be made on this coast, sold currently at 33 cents per pound in the markets of the world. For the past 15 years, since our salines began to be large producers, the price has not averaged over ten cents per pound, being at present not over eight cents per pound, a figure that it will not be likely to even exceed in the future if our home companies can be left in the enjoyment of the protection now extended to them.

With the destruction of this industry a large working force, consisting of laborers in the salines and the works attached, of mechanics, woodchoppers, teamsters, etc., would be thrown out of employment. The farmers, haymakers, and stock-raisers in the vicinity of the borate fields would be deprived of their best, and in most cases their only, local market, the loss of which would compel many of these people to emigrate from the country, while the several companies now engaged in the business would be out to the extent of their investments,

amounting to an aggregate of a million dollars or more.

Having stated the case of the home manufacturer briefly but fairly, we wait to hear what the advocate of free horax has to say in behalf of that policy.

## Amending the Alien Act.

Senator Stewart of Nevada introduced some time since in the United States Senate a bill for so amending the Alien Act as to prevent foreigners buying mining properties in the Territories. This bill having been called up a few days since, passed the Senate by a vote of 31 to 13. That it will pass the House and finally become a law is highly probable. What is remarkable in connection with the consideration of this measure in the Senate is the fact that it should have met with so much opposition in that body, seeing the objectionable clause was retained in the original through sheer oversight, it having been prepared and passed at the close of the session, when all was confusion and hurry.

Those who would naturally have opposed this bill had they been aware of its exact character, failed to do so, under the impression that it was designed to merely prevent the purchase by foreigners of large tracts of the public domain, a practice that had come to largely prevail and was just then the subject of much complaint. The extension of its provisions to the mines was an idea so absurd that its incorporation in the bill never, it may be presumed, occurred to the members of Congress most interested in the subject. As for the author of this bill, he frankly admits that this clause was inserted in it with no definite purpose, his acquaintance with mining matters being so limited that he did not know whether it would prove detrimental to that interest or not. In short, our legislator, knowing nothing about the mines himself, seemed to have proceeded on the hypothesis that if there were anything in his bill objectionable to the miners their friends in Congress would have looked after and sought to have it eliminated therefrom.

Conceived in ignorance and passed by mistake, it is well this law should meet with immediate correction. It would have been to the credit of our law-makers had this been accomplished with less noise and to-do, and at an earlier date. That a blunder so inexcusable and gross should be repaired so quickly and quietly as possible, were certainly a feat for all concerned.

## Good for a Worked-out Mine.

When the big bonanzas of the California and Consolidated Virginia mines, which made a number of millionaires, were worked out some years ago, the general impression prevailed that the Comstock mines, and especially the two mentioned, were "played out." Little ephemeral camps all over the coast made a great fuss over them and called attention to their superior advantages. But the Comstock miners kept on working away against all sorts of obstacles. Within the past two years the bullion production has gradually increased on the Comstock, and if the record could be shown for other camps, it would make them famous.

The March report of the Consolidated California and Virginia mine is as follows:

Mill.	Tons.	Gold.	Silver.	Totals.
Morgan.....	5,000	\$89,441	\$93,639	\$163,070
Eureka.....	3,730	109,056	143,369	252,416
Totals.....	13,730	\$178,497	\$241,009	\$420,456

The yield of the Morgan mill was \$13.88 in gold and \$18.72 in silver, while the yield of the Eureka was \$12.49 in gold and \$16.99 in silver.

Since the present discovery was made the mine has yielded as follows:

	Gold.	Silver.	Totals.
October, 1886.....	\$93,155	\$113,357	\$206,742
November.....	168,733	219,636	387,824
December.....	185,738	236,362	422,100
January, 1887.....	134,099	237,804	371,903
February.....	97,775	172,817	270,592
March.....	112,212	188,328	300,540
April.....	115,281	167,506	282,787
May.....	186,515	175,981	362,496
June.....	135,973	157,971	293,944
July.....	122,640	168,494	291,134
August.....	100,024	127,741	227,765
September.....	80,755	109,657	190,412
October.....	92,106	135,222	227,318
November.....	112,256	145,596	257,852
December.....	172,378	225,183	397,561
January, 1888.....	100,251	198,346	298,597
February.....	154,183	182,158	336,341
March.....	178,497	241,939	420,436
Totals.....	\$2,326,922	\$3,195,848	\$5,522,770

Dividends out of the present body of ore were commenced in January, 1887, and amount to \$7.50 per share, or about 3½ percent per month

at present prices of stock. The total dividends were \$1,520,000, having been consecutive since January, 1887, except last November, when the fire in this mine and lack of water power for the stamps compelled the trustees to pass the dividend. The two mines were some years ago consolidated into one. They stand way above any other mines in the United States as far as bullion product is concerned. For what people call "a worked-out mine" the Consolidated California and Virginia is doing very well. Even the record of the past year or so is magnificent.

## Preserving Grape Must and Skins.

Ferdinand Springmuhl of London, England, has just obtained, through the MINING AND SCIENTIFIC PRESS Patent Agency, a patent on his plan of preserving must and skins, which he has assigned to the American Concentrated Must Co. of this city. The invention relates to that branch of wine making which contemplates the making of wine at some future time and in other localities from grape must previously prepared. The object is the preservation of grape skins for an indefinite time for the purpose of wine-making, so that there may be obtained from the skins thus preserved, and treated with their own concentrated grape must, the identical wine which would be obtained from the fresh grape must.

In carrying out the process the inventor first separates the grape skins from the stems, the juice and seed by any of its usual appliances. He then presses the skins to free them from adhering juice and dries them as much as possible without extracting the color contained in the organic cells of the skins or heating them. The skins may be separated from the juice by centrifugal force instead of pressing, as it is necessary to carefully avoid heating.

The must or juice extracted from the grapes whose skins are prepared as above is subjected to a concentrating process so as to reduce it from a thin liquid, which it is when first extracted, to a liquor of thicker consistence. To do this, the process *in vacuo* is preferred. The concentrated juice is placed in a suitable receptacle so the grape skins may be mixed with it.

To do this, the pressed grape skins are placed in a vessel, and by connecting one end of said vessel with the receptacle containing the concentrated must, and exhausting the air from the vessel, the concentrated juice is forced into the vessel containing the skins, so that they become saturated with it. For convenience of operating, the inventor uses a metallic vessel, lined with tin, and of a slightly conical shape, of the height of the harrel for shipping the skins. The ends of the vessel should be closed, one end being connected with a vacuum pump and controlled by a valve, while the other end is connected with the receptacle containing the concentrated grape must, the connection being controlled by a valve.

Thus arranged, the air is exhausted from the vessel containing the grape skins by operating the vacuum pump, and at the same time by opening the valve controlling its connection with the concentrated grape-must receptacle, the thick grape juice enters every pore of the grape skins. As soon as the vessel is filled with the concentrated juice, the vacuum pump is shut off and also the connection between the vessel and receptacle. Air is then admitted to the interior of the vessel, and by removing the bottom the grape skins, impregnated with grape juice, fall into a barrel placed beneath. The harrel is then filled with concentrated grape juice, and it is ready for shipment. This condensed juice can be used without fermentation. It makes a very palatable drink which commends itself to those who do not approve of fermented liquors.

**SMELTER AT VANCOUVER.**—The Vancouver City Council has received notification of the acceptance of the proposition of the City of London capitalists for the erection of a smelter at Vancouver, B. C., the city giving a bonus of \$25,000. A smelter to treat 50 tons of ore a day will be built immediately at a cost of \$75,000 or \$100,000. The company hailing it has secured mines sufficient to supply the smelter without buying any ores, and will enlarge the works as the ore offered for sale increases. An American company is also considering the location of similar works at Vancouver.

THE hydraulic dock at the Union Iron Works is kept pretty busy, and is in constant demand.

## Comet A, 1888.

The comet which has been the subject of some little attention from a few early risers, and in all the morning newspapers, is a visitor to this planetary system, which was picked up by Dr. Sawerthal at the Capetown Observatory, Africa, on the morning of February 18, 1888. It is about halfway between being a telescopic comet and a naked eye comet, being very bright and interesting from the one point of view and not very much of a success from the other. It could, however, be well seen with the naked eye at about 4:45 A. M. on a few mornings of this month, before the present moon passed the full, and entirely dimmed the light of the new star. Mr. Chas. B. Hill of the Chabot Observatory furnishes us the following information and the accompanying drawing:

To the naked eye it presented the stereotyped form, the tail being unpronounced and not more than three degrees in length at the best, while in an opera-glass or a small telescope the effect was quite pleasing and interesting.

When the comet was first discovered at the distant Capetown Observatory, it was in right ascension 19 hours 11.5 minutes, and south declination 56° 04', being situated in the constellation of the "Telescope." Within a few days enough observations had been collected at the observatories in the southern hemisphere to compute an orbit for the comet, and this was rapidly done by Mr. S. C. Chandler of Boston, U. S., and Mr. Finlay at the Cape of Good Hope, the observations having been telegraphed all over the world by means of the modern methods of astronomical telegraphy. The elements thus deduced were immediately disseminated by the same process, and soon the whole northern hemisphere was on the outlook for the comet, which, moving very rapidly toward the north, and at the

same time to the eastward, was computed to reach the "perihelion passage" on March 18, 1888. The path marked out for the comet led up to the equator (reached March 28th), through the constellations Capricornus and Aquarius, passing about three degrees to the southward of the third magnitude star *Beta Aquarii*. This is the only bright star in the later portion of the comet's path, and served as an efficient mark by which to pick it up.

The comet followed very close to the prediction made so shortly after discovery. On March 18th it was telegraphed out here to the Pacific Coast that Prof. Swift of the Warner Observatory, Rochester, New York, had seen the southern comet, but California had already been to the front through the interest in such matters displayed by Mr. F. G. Blinn of Highland Park Observatory, East Oakland, who succeeded in picking up the visitor with his reconnoitering glass on the morning of the 16th. [Subsequently it appeared from the astronomical magazines that Mr. Frank Muller had detected the comet low down in the east on the morning of the 14th, he having the use of the great 23-inch Princeton refractor. This was probably the earliest American observation.]

On the morning of the 18th it was carefully observed with the micrometer by one of the assistants at the Chabot Observatory, Oakland, who has continued to secure places, by comparisons with the nearest available and well-determined stars, on all mornings when the weather would permit. A rough reduction of some of these observations has been obtained by the observer, and is given in the following table:

MICROMETER OBSERVATIONS OF THE COMET.				
(Made at the Chabot Observatory, Oakland, Cal., Fred. M. Campbell, Director; 8 1/2 inch equatorial. Observer—C. B. H.)				
DATE.		PLACE OF		
1888.	HOUR.	Right Ascension.	Declination.	
	Hours.	h. m. s.		
March 17th..	5 1/2 A. M.	21 20 27	-13 10'	
March 20th..	5 1/2 A. M.	21 23 35	-11 47'	
March 25th..	5 A. M.	21 39 34	-5 05'	
March 28th..	5 A. M.	21 42 43	-3 52'	
March 29th..	5 A. M.	21 45 51	-2 38'	

The comet is rising a few minutes earlier each morning, and will probably be within reach of our telescope for some time yet. It has grown

## Mining Accidents.

At the Water Lily mine, West Point, Calaveras county, the engineer had his hand crushed in a pinion while tightening a nut with a wrench. The hand was crushed nearly to the wrist, when the wheels were stopped by the wrench, and there he was held powerless with no one about the place to afford assistance and release from the terrible situation. The nearest help at that hour was at the Bazing Star mine, fully 400 yards away, where his cries for help were unheard. Suffering untold agony from the crushed and fastened hand, he finally took his knife from his pocket with the other hand, opened a blade with his teeth, and in desperation he cut off the hand at the wrist joint and thus freed himself. The unfortunate man, whose name is Merun, has gone to the hospital. Timothy Riley was killed last week in the shaft of the St. Lawrence mine, Butte, M. T. He had on the cage a sheet of heavy iron, and it is supposed it was too long for the cage. At any rate, when the cage was nearing the 100-foot level, the engineer felt it catching and jerking. He immediately stopped it. It was

## The Technical Society.

At the meeting of the Technical Society of the Pacific Coast, held on Friday night of last week, Marsden Manson presided. Mr. E. C. Burr described the discovery of a peculiar fungoid growth found in the sewer pipes of his house. The pipes became clogged and gave considerable trouble. He then applied a solution of caustic potash, and the result was there was found in the hopper a mass of fungoid substance which was removed from the pipes. One piece nearly the size of the pipe was 30 feet long. A specimen was exhibited which has an extremely repulsive odor. It is a slimy, tough substance, which had formed in course of time in the house drain pipes.

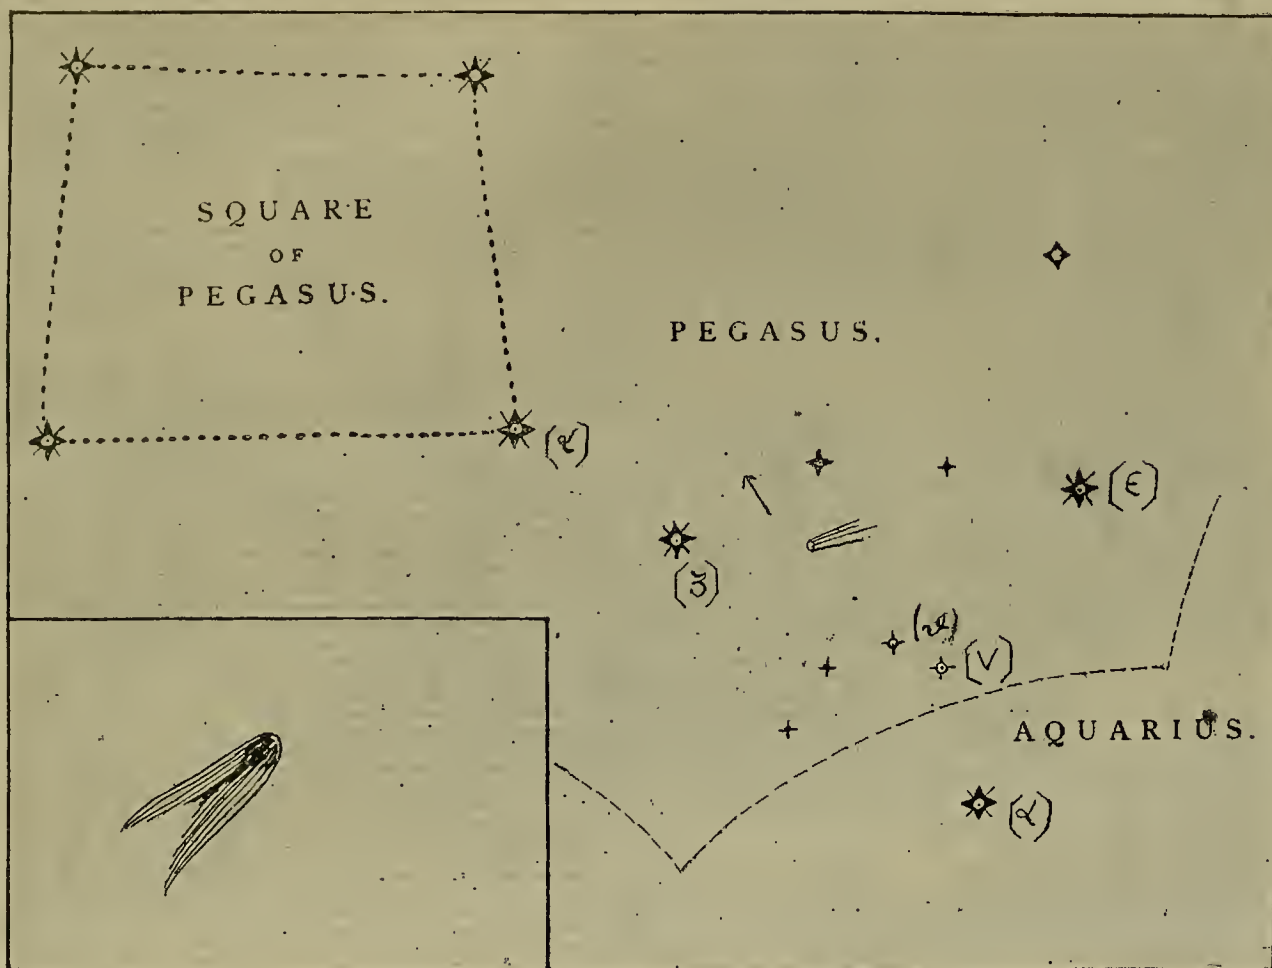

Arthur F. Price, the new secretary of the society, spoke on the subject of the adulteration of oils. He produced several samples and explained the method of testing by diffusion in water, showing that as low as one per cent of adulteration could be detected. By the method employed cards may be prepared which serve as standards for various oils and the adulteration of any can be determined.

President Manson presented to the society weather maps, supplied by the Signal Service office, showing the course of the remarkable storm which passed over the United States last month. It appears that the storm had its inception in the North or Central Pacific ocean and traveled over the continent, taking the form of a blizzard. When it reached the Mississippi valley it subdivided into two storm centers, which traversed in parallel lines Canada and the Southern States. From the meager data at hand, it is believed that the same storm then crossed the Atlantic ocean and passed over the greater part of Europe.

After the adjournment of the meeting, those present went elsewhere to celebrate in an informal manner

the anniversary of the foundation of the society. Speeches and remarks were made by Messrs. Manson, Price, Burr, Keith, Yale and others.

**PATENT INFRINGEMENT DECISION.**—The Supreme Court of the United States has just entered a decree for the largest amount ever given for infringement of a patent. It is in the case of R. A. Tilghman vs. Wm. Proctor, and the plaintiff is awarded \$320,715 damages for infringement of his glycerine patent. In 1854 Mr. Richard A. Tilghman of Philadelphia obtained a United States patent for the manufacture of glycerine and stearic acid from ordinary fat, by the use of highly heated water alone, under pressure in a close boiler. The invention revolutionized the manufacture of candles in this country, and led to the production of glycerine at such a price as brought it for the first time into general use. He visited England and sold his patent to the Prices of London, the great glycerine manufacturers. While engaged in the introduction of his invention into England, several large manufacturers in this country appropriated Tilghman's invention. He sued, and the lower court awarded him \$250,000. An appeal was taken, and now he gets the same amount with interest.

POSITION OF THE COMET ON APRIL 6, 1888.

perceptibly fainter, and will not again be suitable for observers without optical aid even after the moon has left the morning sky. A new ephemeris which represents the present movement of the comet very well indeed has been computed by Louis Boss of Albany, N. Y., and gives the following predicted places:

EPHEMERIS FOR GREENWICH, MIDNIGHT.			
1888.	Right. Ascen.	Declination.	
	hr. m. s.		
April 6.5.....	22 17 49	+8° 43'	
April 10.5.....	22 29 33	+12° 30'	
April 14.5.....	22 40 57	+15° 52'	
April 18.5.....	22 51 59	+19° 55'	
April 22.5.....	23 02 37	+24° 42'	

The position of this comet among the stars for the morning of April 6th is given in accompanying sketch, which is supplemented by a rough sketch of its telescopic appearance on a recent date. It should be easily seen with a good field-glass for several mornings yet. The enlarged sketch on the lower corner of the cut is a telescopic view. On the morning of April 5th the nucleus was seen in two parts, clearly divided about three seconds of arc; this observation was telegraphed to the Eastern observatories, and has received confirmation from a similar observation at Mt. Hamilton.

found that the sheet of iron had caught upon the timbers in the shaft. Riley was not upon the cage. On examination, his body was found at the bottom of the shaft, having fallen 500 feet. It is supposed that the iron by catching in the timbers knocked him off the cage.

Enoch G. Kellogg, son of the foreman of the Lexington mine, Butte, was killed last week by falling down an ore chute to the level below, a distance of 100 feet. He was 18 years of age.

Wm. Rowe, while working in the Gribble mine, near Junction City, Trinity county, was caved upon and killed. He had been warned of the danger but did not heed the warning.

John Polette was injured in the Winnemucca mine, Nev., by a rock falling upon him. Wm. Shea, in the Orleans mine, Nevada county, had his foot mashed by a falling rock. Men and crows were necessary to effect the release of the foot. Thos. Gill of Badger Hill, Nevada county, had his finger mashed by a two-ton howler rolling upon it.

In another column will be found the business card of J. B. Jardine of the Atlas Iron Works of this city, the manufacturer of the road-rolling machine illustrated on the first page of this number of the PRESS.

## SCIENTIFIC PROGRESS.

## Why Does Coal Produce Heat?

The combustion of coal is nothing more nor less than its combination with oxygen gas. When a fuel of any kind combines with oxygen, heat is produced. Why fuel should combine with oxygen no one can tell. It is one of nature's secrets. The chemist tells us that the oxygen and the fuel have an affinity for each other. But when this statement has been made we are no nearer to understanding why combination takes place than we were before. In text-books nothing will be found as to why heat is produced by the combination. On this point an all but universal silence prevails. We are told, however, by a few writers of the old school, that heat energy was stored up in this coal millions of years ago by the sun, and that this heat energy is liberated when the coal combines with oxygen. This is absurd. It will not be out of place to give here an explanation which is consistent with facts, and therefore appears to be satisfactory.

All bodies, substances, gases and liquids are supposed to be composed of multitudes of particles or molecules of almost inconceivable smallness, and these are supposed to be in motion among themselves. This motion is heat; that is to say, heat is neither more nor less than a kind of motion, and this internal vibration can be transmuted into a perceptible mechanical movement, or, on the other hand, mechanical movement can be converted into the invisible motion called heat. How the change takes place no one knows, but the change is none the less a fact. Now, the difference between a solid and a gas is that the motion of the particles or the molecules of the gas is much greater in extent than is the motion of the particles of the solid. Also, some gases have a greater range of motion than other gases. If by any means we can take the motion out of gas, say by compressing it into a vessel the sides and ends of which reduce the range of movement, then, as nothing is lost in nature, the invisible and insensible motion of the gas, which it has lost, reappears as heat in a sensible form, and we find that the sides of the vessel become hot. Now, the oxygen which has combined with coal has a very considerable range of internal motion, but when the oxygen has combined with the coal another gas, known as carbonic acid gas, is produced, as will be explained further on; and the particles of this gas having a much smaller range of motion than the particles of the oxygen have, the difference appears in the form of heat.

It is not necessary to tell readers that coal is not always the same. It is composed of various substances and gases. The principal are carbon, hydrogen, oxygen and certain impurities which make the ash with which we are so familiar. The carbon, hydrogen and oxygen are elements; that is to say, they are not composed of separate substances combined together. They cannot be split up into anything else. In 1000 pounds of anthracite coal there are about 915 pounds of carbon, 35 pounds of hydrogen and 26 pounds of oxygen. In a good bituminous or North Country coal there will be 800 pounds of carbon, 54 pounds of hydrogen and 16 pounds of oxygen.

The difference between the sum of these quantities and 1000 pounds is matter entirely non-combustible, which appears as ash. Of course, there are an infinite number of variations in the proportions which the constituents of coal bear to each other, but the figures we have given fairly represent good Welsh and North Country coals respectively.

The air we breathe is composed of two gases—oxygen and nitrogen. The latter appears to have no effect whatever on human life and combustion. It serves to dilute the oxygen. The two gases are mixed, they are not in chemical combination. By weight, approximately, 36 pounds of air contain 28 pounds of nitrogen and eight pounds oxygen. In bulk they are mixed in the proportion of, roughly, four to one—four cubic feet of nitrogen and one of oxygen, making five cubic feet of air.—*Mechanical Engineer.*

## The Time Occupied in Thinking.

One of the most beautiful applications of electricity which has of late been made is its use in the study of psychological phenomena. And why, indeed, is not the subtle power by which time and space are being annihilated, and human labor rendered less irksome, the most proper agent to assist man in the study of the facts of his own consciousness? In an elaborate article in the *Nineteenth Century*, Dr. J. McK. Cattell gives an account of the time measurements of thought made by means of the line drawn on a rapidly moving surface by a pen attached to the prong of a tuning-fork vibrating at a constant rate, by means of electricity. By a delicate apparatus constructed on this principle, duration of time may be measured to the one ten-thousandth of a second. The writer above named has found that the process of thought varies in its degree of rapidity in different individuals, children and old persons thinking slower than people of middle age, ignorant persons thinking more slowly than educated persons. In this way he also found he could measure the time it takes to perceive—that is, the time which passes from the moment when the impression reaches consciousness until the moment at which we know what it is. In his own case he found that it

took 1-20 second to see white light, 1 10 second to see a picture, 1-8 to see a letter and 1-7 to see a word. It takes longer to see a rare word than a common word, or a word in a foreign language than in our native tongue. It even takes longer to see some letters than others. "Will time," or time taken up in choosing, can be measured. It takes 1-13 second to judge between blue and red. To recall the name of a printed word takes 1-9 second, to a letter 1-6 second, to a picture 1-4 second. It takes less time to remember the name of a familiar word than a letter, though it takes less time to see the letter. The time of remembering can be measured. It takes 1-4 second to translate a word from one language to another when you are familiar with both. It takes 1-20 second longer to translate a word from a foreign language to your native tongue than it does in the other direction. We can think of the name of the next month in half the time we can think of the last month. It has been demonstrated that sensation does not travel through the nerves to the brain so fast as has been supposed. Its speed is not much greater than 60 miles an hour.

**THE NATURE OF HEAT.**—Prof. Dana says: "Heat is now believed to be not a form of matter, once supposed, but a 'mode of motion,' more particularly it is a very rapid undulatory vibration of the particles of matter making up the heated body. When heat is transmitted through a medium without raising its temperature, it is said to be radiated, and the undulatory motion is believed to be propagated at a very great velocity by the particles of a supposed elastic fluid called the ether. Thus, the heat of a stove is said to be radiated in all directions from it; so, too, the heat of the sun is said to be radiated to the earth, and the received is called radiant heat, or radiant energy. When, however, the heat is transmitted through a body at a comparatively slow rate, as from one end of an iron rod thrust into a furnace to the other, it is said to be conducted, and in this case the particles of the bar itself are believed to propagate the motion. A hot body is one whose particles are in rapid motion; but 'hot,' as the word is used, is only a relative term, for this motion belongs to the molecules of all bodies of which we have any knowledge, however 'cold,' and the rapidity of the motion determines the degree of heat (temperature), as manifested, for example, to our senses or to a thermometer."

**MEASUREMENT OF CLOUDS.**—The most important work in the measurement of clouds is now done at the University of Upsala, Sweden, by Messrs. Ekholm and Heggstrom. When opportunity offers, the heights of clouds are determined thrice daily by simultaneous observations at two telephonically connected stations about a mile apart. The angles of conspicuous points are carefully noted by means of specially adapted instruments, giving much more satisfactory data for fixing the distances than have been obtained by the photographic method attempted at Kew. The greatest height of any cloud yet measured is 43,800 feet, and the highest velocity is 112 miles an hour for a cloud at 28,000 feet. The most important result thus far reached from these measurements is the fact that clouds are quite regularly distributed in three layers, the mean summer levels for Upsala being: Low clouds—stratus, cumulus, cumulonimbus 2000-6000 feet; middle clouds—stratus cirrus 12,000-15,000 feet; high clouds—cirrus, cirro stratus, cirro-cumulus, 20,000-27,000 feet.

**THE SENSES OF ANIMALS.**—An interesting thought in regard to the senses of animals has been corroborated by Sir John Lubbock. Animals are supplied with complex organs of sense richly supplied with the nerves, the functions of which organs we are powerless to explain. One must regard his dog with more respect in the thought that in animals there may be several other senses as different from ours as sound was from sight; and even within the boundaries of our own senses there might be endless sounds which we could not hear, and colors as different as red from green of which we have no conception. These and a thousand other questions remained for solution. The familiar world which surrounded us might be a totally different place to other animals; to them it might be full of music which we could not hear, of color which we could not see, of sensations which we could not conceive.

**THE DEPOSITION OF ALUMINUM.**—Aluminum is one of the most difficult and uncertain of metals to deposit electrolytically. The following recipe is given by M. Herman Reinhold, who states that it furnishes excellent results: 50 parts by weight of alum are dissolved in 300 of water, and to this is added ten parts of aluminum chloride. The solution is heated by 200° F., and when cold 39 parts of cyanide of potassium are added. A feeble current should be used.

**VULCAESTON** is the name given to a new article just placed on the market. It has all the qualities of asbestos and vulcanized caoutchouc. Vulcaeston can be manufactured perfectly pliable, and, at the same time, as hard as ivory; it offers a perfect resistance to heat, fire, every kind of vapor, acid and chemical, and will soon find a great many uses and applications, especially in lithography and other graphic arts.

## MECHANICAL PROGRESS.

## Electrically Joined Metals in the Trades.

We think great changes are impending in the method of joining metals of similar and of diverse natures. Electric welding is being seriously investigated as to its probabilities, and before many months have passed there will undoubtedly be several systems in commercial operation. No mechanic has ever witnessed the joining of two metals by electricity without being greatly struck with the results and the very great advantages over old methods in cleanliness and homogeneity.

When electric welding becomes a settled fact, machine parts and all branches of hardware manufacture will be very greatly improved; where solder is now used the metals will be joined together electrically, and where a brass tip, shank or base is needed, it can be united to cast iron, wrought iron, steel, or any other metal, without the chance of being detached. Many things which are now drawn up in brass can be spun up in lathes and burned together, and cast-iron details may be reinforced with steel faces, which are an integral part of the piece. We do not exclude boiler shells from the catalogue of new structures or new methods made possible by electric welding, and instead of courses riveted together we shall have shells and flues in practically one piece, with very much greater tensile strength than riveted structures.

The one thing that has been doubtful about this system of electric welding is the effect it may have had upon the metal itself as regards the deterioration, but it has been shown by investigation and elaborate experiment that this fear is groundless.

To test the question, wrought iron droppings from the welding process were fused again by means of the arc to a bar of about 15 millimeters thickness, and this bar turned down to 10 millimeter. The breaking weight of this bar was 37.5 kilogrammes per square millimeter (23.8 tons per square inch), with an elongation of 17.5 per cent. The fracture was fibrous, like that of soft steel. This electrically fused iron resembles soft steel in other respects, notwithstanding its origin. It is malleable, can be welded, can be bent both cold and hot, and is scarcely harder than soft steel.

In the light of this testimony, we can hardly overestimate the value of electrically joined metals in the trades.—*The Engineer.*

**THROW OUT YOUR ANTIQUATED MACHINERY.** Said a practical mechanic lately: "A notable feature in good machine tools is that they do not so much wear out as become antiquated; hence one sees, in going round some workshops, machines in use of which the owners are very proud, but which should have been expensed years ago by others capable of doing at least twice the amount of work. They are retained simply because they are capable of doing a certain work, which is all very well if we neglect the question of cost, or it may be, as I have sometimes seen, in the case that they represented a certain sum in the stock book, but if carried to the scrap heap it would be necessary to write them off. Looking boldly at this question of capital account, we can easily see that the vital consideration in any workshop is the workman. If we put a workman's wages at \$4 a day, we see that, considering interest of capital and depreciation of machinery at the rate of 10 per cent, the workman is a sort of animated machine and the representatives of a capital sum of say \$1500, so that the question is not whether a man can profitably occupy a certain machine, but whether the machine can profitably occupy this man."

**A NEW SYSTEM OF MANUFACTURING METALS.** The 150 members of the American Institute of Mining Engineers, which recently held in Boston the 18th annual meeting of the institute, visited Fitchburg, Mass., on the 24th of February to examine the Simond's rolling machinery, a new device which is destined to revolutionize the manufacture of metals. It may be briefly described as a machine in which two flat surfaces, acting vertically or horizontally, and moving in opposite directions, with adjustable dies fixed upon them, roll in one motion a piece of metal regular or irregular shape and in almost any pattern desired. At a single stroke of the mechanism may be obtained a sphere, a cone, a chair screw, a bolt with thread and head, a car or carriage axle, and an endless variety of other forms. The visiting experts were amazed and delighted. "It is the greatest thing in half a century," said one. "It marks a new era in the manufacture of iron and steel," said another, and so the comments ran. This extraordinary machine has only lately become known to engineering experts, and has only just now been made known to the general public. We shall look with interest to further details.

**COPPER STEAM PIPES.**—Discussing the subject of copper steam pipes, brought up by the explosion on the British steamer *Elbe*, the *London Engineer* recently remarked: The question deserves consideration. Why use copper piping at all? It is difficult to see what precise advantage it possesses over good lap-welded steel or iron tubes. It appears, moreover, that a very good pipe might be made of thin steel

riveted. Such a pipe could not be calked steam tight, but might be brazed steam tight, its strength depending mainly on the rivets, while the brazing would be a substitute for calking. Now that a doubt has been cast on the merits of copper for high pressure work, it is possible that some ingenious individual will produce something as new and as suitable for its intended purpose as the corrugated flues which render high pressures possible at sea.

## Artistic Brass and Bronze Works.

Owing to improved modes in the manufacture and treatment of the surface of brass, it has recovered much of its ancient prestige, not alone for the articles solely in this metal, as tables and beds, but as mountings. A perfect passion for the employment of brass, one of the least tractable of metals, prevailed in England and the continent in the last century; furniture was capped with fanciful devices in it; figures furnished and a granulated ground were inserted for panels; the fireplace reflected back from brass surfaces the glow of fire; baluster rails and pillared supports of vases and statues shone. Desks and all articles of furniture were set with inlaid brass, and boxes adorned with the metal, like the ironwork on the cistas of the Venetians. Lettered brass plates and statues with heraldic adornments were set up in churches as memorials. With less pronounced employment of the metal, brass has advantageously been applied to purposes then unthought of, as in lighted heds, while we continue its use for handles and keyhole plates and furniture drawers. But it is in combination with other metals, such as oxidized silver, in card, tete-a-tete tables, coronas of chandeliers, supports and pendants, and for curtain and portiere chains and in various mountings that artistic ingenuity has been most displayed.

## Artistic Bronze.

But there is no metal of which the past furnishes so many artistic examples as bronze. These supply a vast repertoire for the modern worker, whose business it is to study style of treatment rather than to mechanically imitate. The reproduction, however, in this composite material, on a reduced scale, of some of the finest productions of the sculptors and other artists of former times—a valued resource of beautifying interiors—has done much to spread the love of art. The latest and most ambitious efforts in bronze are on the part of certain foreign artists who are reproducing in high relief, for wall adornment, historical scenes as delineated by celebrated painters, representing groups of persons in interior. It may be questioned whether the excellence now realized in expression of human figures in bronze, as far as delineations of action, sentiment and passion are concerned, was ever before so admirably realized. One high qualification of bronze for such artistic work is the variety of tones of which the surface admits, including the most delicate gradations of shade.—*Chicago Journal of Commerce.*

**POLISHING STEEL.**—A finely polished, lusterless surface on tempered steel can be procured by either of the following operations: After the steel article shall have been tempered, it should be rubbed on a smooth iron surface with some pulverized oil-stones until perfectly smooth and even, then laid upon a sheet of white paper and rubbed back and forth until it shall have acquired a fine, dead polish. Any screw-threads or depressions in the steel must be cleaned and polished beforehand with a piece of wood and oil stone. This delicate, lusterless surface is quite sensitive and should be rinsed with pure, soft water only. A more durable polish can be obtained by first smoothing the steel surface with an iron polisher and some powdered oil-stone, carefully washing and rinsing. Then mix in a small vessel some fresh oil and powdered oil-stone, dip into this mixture the end of a piece of slider pith, and polish the steel surface with a gentle pressure, cutting off the end of the pith as it shall commence to become soiled. In conclusion, it should be thoroughly cleansed in soft water, when the article will be found to have a fine, lusterless polish.

**MONSTER LOCOMOTIVES.**—Immense as is the strength and weight of some of the monster locomotives recently turned out by the Eastern shops, it is said that the culmination of magnitude has not yet been reached. Steadily they grow, these fruitful plants of our new civilization, and there is no telling where they are to stop. It is well that we have steel instead of iron for rails, and soon it will be Ajax, Hercules, Atlas, as well as Goliath rails, and it may be an aluminum or bronze metal for trunks of lightning speed and a hundred 30-ton cars means that substantial material will be required. It is said that the new locomotive works which the Pullman Co. are erecting will engage in the manufacture of these monster locomotives.

**PACKING RINGS.**—A recent English invention relates to casting packing rings ready for use without boring or turning. The rings are cast in a chill mold around a metallic core.

The cable of the second, or North Beach and Market-street division of the Ferries & Cliff House Railway system, 19,000 feet long, has been successfully laid.

## GOOD HEALTH.

## Old Age.

The Physical Changes of Advancing Years.  
Failing Mental Powers.

In continuation of this subject from our last issue, we subjoin the following interesting series of facts through which we may learn the methods by which longevity is attained, and also those matters which are constantly striving to interfere with reaching advanced old age:

The advance of age is indicated by signs which tell unmistakably that all the powers of life are declining. Thus the ravages of disease are repaired with less rapidity than during the more vigorous periods of life, or permanent defects are left, showing the inability of the body to restore itself completely. It frequently happens that losses of substances occasioned by disease are apparently filled up as in earlier periods, but a close examination of the replacing tissues shows them to be made of inferior stuff. The occurrence of the so-called degenerations is highly characteristic of age. Chief among them are the fatty and calcareous degenerations. Fatty degeneration is especially apt to show itself in those organs most essential to health, and whose failure interferes most directly with the phenomena of life. The muscles, especially of the heart, are most disposed to this change. Little granules of fat take the place of the contracting material essential to muscular action, and the organ becomes weakened in proportion to the number of fibers which have undergone this change. The liver, kidneys, and other glands are next most often affected by a similar deposit of fat, which takes the place of the secreting cells essential to the continuance of the performance of the important duties of these glands. Fatty degeneration may, and frequently does, attack the walls of the arteries, weakening them and leading to rupture and outflow of the blood contained therein. This is the change which usually leads to apoplexy and aneurism, quite common in the aged. Such bleeding leads to death or paralysis, mostly of one or the other side of the body. When the same process attacks the arteries of the brain, it makes them brittle and leads to the easy fracture so frequently seen in old age.

Calcareous degeneration frequently follows the fatty form. When this is the case the disposition of the arteries to break and permit hemorrhage is increased. But the most characteristic of the effects produced by this change is the mechanical interference it produces in movements of different parts of the organism, especially where flexibility is necessary to the proper performance of movements. Thus the ribs, breastbones, cartilages of the ribs and the substance between the numerous small bones of which the spinal column is composed, become stiffened and rigid from the deposits of lime salts. This renders free movements of these parts impossible and may occasion much pain. When the process extends to the valves of the heart the consequences are extremely disastrous. All the serious consequences of valvular disease of the heart present themselves the same as if they were due to inflammation, and death results from heart failure. If the coats of the arteries become calcified, they may become clogged and occluded by the formation of a clot upon their inner coat (thrombosis), or they may break with little provocation, producing, in either case, paralysis or death, after the same manner as that due to hemorrhage from fatty degeneration. A somewhat similar process of degeneration may take place in the crystalline lens of the eye, producing cataract and blindness, often curable by operation.

Calcareous degeneration attacking the walls of the arteries of the brain may produce disastrous results in two different ways—by making them brittle and thus tending to apoplexy, or by encouraging the formation of clots, which, sooner or later, shut off all blood supply in the region to which the vessel is distributed. The effect of depriving a part of the brain of its supply of blood is to cause its destruction by softening.

## Softening of the Brain.

Most cases of softening of the brain occur in old age and are brought about in the manner just indicated. If the softening attacks a part of the brain whose business is to begin movements, then paralysis, or loss of the power of voluntary motion, will be an important symptom. If a part of the brain used in thinking or the formation of judgments, comparisons, etc., is attacked, then failure of the mental faculties will follow. It is a matter of common observation that softening of the brain is almost certain to show mental failure, especially loss of memory, with transitory paralysis of individual limbs at first, passing into complete and permanent loss of the power of motion in the later stages.

Not so often in occurrence, but happening without great infrequency, is "senile gangrene." This is a mortification of one or both lower extremities, which is produced in a manner exactly like softening of the brain. Thus the inner coats of the arteries become rough and rigid from calcareous degeneration. The blood deposits a clot all along the inner surface because of this roughening. Finally there comes a time when all circulation is shut off from the feet and lower part of the leg. If the veins and absorbents are open and capable of draining the dead substance of its fluids, the

parts dry up, turn black, shrivel and become mummified. This is the dry gangrene of old age. In case the drainage of the part is defective, the fluids in the dead parts undergo putrefaction, the very characteristic odor of decomposing flesh arises, sloughs occur, and the surface breaks down into foul ulcers. This is the moist form of senile gangrene.

It may be easily understood that old age is not the only cause of this condition. It may occur in early life as the result of frost-bite and other injuries greatly impairing the vitality of the tissues or of the arteries. Removal of the dead parts is the only remedy for senile gangrene. The amputation should be made through healthy tissues far above the point where the "line of demarcation" separates the dead from the living structures. This is because the arteries are always diseased a long distance from the points which are actually gangrenous.

## The Period of Decline of the Bodily Powers

Is marked by a progressively increasing loss of power to develop animal heat. This is shown by the inability to resist chilly weather and the disposition for the hands and feet to become cold. There is of the same time an inability to perform muscular exertion. These two facts are closely related, for muscular contractions are the principal source of animal heat. The appetite, as a rule, remarkably lessens, while the waste materials are also diminished in amount.

The lessened activity shows itself in the mental operations also. The mind is less vigorous, as a rule, and original works of a literary or scientific character are seldom undertaken after the age of 60. Facts submitted to the judgment may be passed upon by the sage with great correctness and discrimination, for the influence of the feelings is partly, if not entirely, removed by the effects of age. This may require time; but the value of the opinions of the aged who have preserved their mental faculties is proverbial. The slowness of mental action is perhaps due to the slow processes of nutrition which mark the workings of the nerve cells as well as those of every structure.

The physical change in all kinds of cells seems mainly to be a deposit of fat granules, in the first place, which is followed by absorption of the fat and the substitution of lime salts in its place. The deposit of either fat or lime in place of the structures proper to any part, of course, hinders the normal work that should be performed by the structure which has undergone this transformation.

The characteristic changes which go along with old age, and to which the final stoppage of the machinery of life is due, are seen to be mostly degenerations of structures in which the normal active tissues are replaced by materials of inferior quality. Fat and lime salts are very poor substitutes for the healthy, contractile muscles, or the transparent structures of the eye. It has been thought by some that if we could prevent the introduction of earthy salts into the body by way of food and drink, the rigid arteries and degenerations generally of age might be prevented. The plan proposed for thus forestalling age is as follows: Drink nothing but distilled water, or a drink containing phosphoric acid and the juice of lemons, of which distilled water is the basis. Eat no vegetable containing much of the earthy salts. This would exclude spinach, cabbage, etc., from the diet. No tea nor coffee. Take plenty of milk. A much more rational diet would be one containing but little albuminous food, plenty of milk, no eggs nor lean meat, but as much fat as can be taken without discomfort. It has been observed that calcareous degeneration is almost always preceded by chronic changes in the kidneys, and these are certainly hastened by a diet of lean meat, eggs and the like.

Many individuals have become aged long before the number of years they have seen would entitle them to the distinction of longevity. A glance at the prematurely aged may give some hints as to the means of prolonging life beyond its usual limit. Sir Walter Scott gathers many of the causes of precocious senility together in the following eloquent stanza:

Danger, long travel, want and woe  
Soon change the form that best we know;  
For deadly fear can time forego  
And bleach at once the hair;  
Hard toil can roughen form and face,  
And want can quench the eye's bright grace,  
Nor does old age a wrinkle trace  
More deeply than despair. —Marmion.

Too rich a diet—rich in albuminous food—predisposes to gout, and this to kidney disease. Indulgence in strongly alcoholic drinks has the same result. The effects of "high living" are made still more serious by deficient muscular exercise, and all of these favor the development of fatty and calcareous degenerations in the heart and arteries. "Fast living," excesses of every sort, and indolence, are among the most certain hindrances to attaining longevity.

In advanced life the lungs are especially prone to inflammation. The pneumonia of old age is excessively fatal. Even an ordinary "cill on the lungs" is liable to become a very serious matter. The ribs and breastbone lose most of their elasticity, and breathing is not so deep or so free as it is in earlier years. Hence one of the reasons for the fatality of bronchitis and catarrhal pneumonia in the aged. One remarkable fact connected with the pneumonia of old age is that it may run its course to a fatal termination and give but little notice of its presence by significant phenomena. Hence this disease is very frequently overlooked. A large

number of cases of "senile debility," "senile marasmus," "deaths from old age," are, in reality, due to pneumonia. It is proper to call such cases deaths from old age, for if this factor had been absent the disease would probably have been recognized and properly treated, the element of old age having been the really important one in determining the fatal result.

It is very likely that the constitution and tendencies inherited from the ancestry have much to do with long life. Of course, leaving all accidents, epidemic diseases, etc., out of account. Hereditary tendencies include more than mere bodily form and toughness of fiber. There are mental and emotional tendencies which are equally important in determining the length of life to be attained by the possessor. Control over the passions and the ability to foresee and guard against consequences are not less important than the possession of good digestion and a nervous system perfect in all its parts. —St. Louis Globe Democrat.

## USEFUL INFORMATION.

## Utilizing Waste Material.

Much attention is now being paid to the utilization of waste material. A few years ago the tar and other material, with the exception of coke, which form the residuum of gas manufacture was allowed to go to waste. Now, nearly every particle of such waste is utilized. So important has this saving industry become that careful estimates place the capital invested in this one branch of utilizing waste at the enormous sum of \$250,000,000. Should the gas industry cease, that amount of capital would be withdrawn from the producing power of this country alone.

Cottonseed is another large source of industry. A few years ago there was no better use known for cottonseed than to dump it on the manure heap. The annual production of cottonseed oil now reaches far up into the millions in value. Within little over a year still another important advance has been made in this industry. The residuum, after expressing the oil, has heretofore been used simply as a "meal" for feeding cattle. A large establishment is just now going into operation to treat this meal by a new chemical process by which one ton of the meal is made to give up fully ten dollars' worth of a new and more valuable oil than that obtained by the expressing process, while the meal loses nothing of its nutritive value as cattle food.

Sawdust is another material which until quite recently has been considered a worthless waste. It has now become a valuable product. In some parts of the State of Maine sawdust is dressed into convenient sizes and inclosed in barrels for convenience of transportation. In this form it can be economically shipped. This mode of packing and shipping has become quite an important business. There is a large demand for it in this form, and the future of haled sawdust is quite secure for use in stables and for various other similar purposes—particularly in cities. Everybody knows the advantages of putting hay in bales for economy in handling and transportation. It is also largely used in its natural condition, or mixed and pressed with other materials, for fuel. The amount of sawdust that is available for the purpose of haling and transportation, taking all the various lumber regions into account, is immense. The percentage of lumber that is converted into sawdust in cutting, furnishes unmistakable evidence of the large quantity of this material that is produced.

Even city garbage is turned to profitable account in many places. In the city of New York it is made to turn at least \$18,000 annually into the city treasury. There are numerous other kinds of what was formerly considered worthless waste, which are now turned to profitable account and made to afford much employment for labor.

To convert a waste material into a salable article there is generally needed only a little inventive ingenuity to discover valuable properties hidden away and adapting them to useful purposes. This general truth is becoming more and more important in almost every line of industry.

**PRESERVATION OF FLOWERS.**—The *Chronique Industrielle* says that flowers may be preserved with all their brilliancy and freshness in the following way: In a well-corked bottle, dissolve 6 drachms of coarsely-cracked, clear gum copal mixed with the same weight of broken glass, in 1½ ounces (by weight) of pure rectified sulphuric ether. Soak the flowers in this mixture, take them out slowly, and expose them to the air for ten minutes, and then immerse them anew, and again expose them to the action of the air. Repeat this operation four or five times. The flowers thus treated will keep for a long time if care be taken not to handle them too much.

**A DURABLE CEMENT.**—An account published in one of the foreign technical journals states that the cement which was employed in the restoration of the great colonnade of the Louvre, of the Pont Neuf and of the Conservatoire des Arts et Metiers, consisted of a powder and a liquid, prepared according to the following ingenious formulae: First, two parts by weight of oxide of zinc, two of crushed limestone of a hard nature and one of crushed grit,

and the whole intimately mixed and ground, either in suitable proportions being added as a coloring matter; second, a saturated solution of zinc in commercial hydrochloric acid, to this being added a part, by weight, of hydrochlorate of ammonia, equal to one-sixth the quantity of dissolved zinc, this liquid being diluted with two-thirds of its bulk of water. In the use of this cement, one pound of the powder is mixed with 2½ pints of the liquid. The cement made in accordance with this rule is found to acquire a great degree of hardness in a very short time, and possesses the advantage of uncommon strength.

**CEMENT** is a term applied to that body which is capable of uniting homogeneous or heterogeneous substances. This action may result either from chemical combination, or it may be simply mechanical, and due to the adhesiveness of the cement, by which air is excluded from the surface to be united. In the former category may be classed the hydraulic, or building cements, used in architecture and formed from the argillaceous limestones which, on calcination, are rendered capable of setting under water with rapidity, of acquiring great hardness in a short time, and of being employed without the admixture of any foreign substances. Among the hydraulic cements the most widely known are the Roman, Portland, Medina and Mulgrove in England and the Kingston and Rosendale cements in this country. Roman cement was first manufactured by Mr. Parker of London from the septaria nodules of the London clay formation, found in the Flind of Sheppy; his process, which was patented in 1796, consisted in calcining the atoms nearly to the point of vitrification and then reducing it to powder by crushing. He applied the term Roman to his preparation from its similarity to that formed by the ancient Romans from puzzolana and trass, volcanic substances nearly allied to the septaria. Portland cement is so termed from its similarity in color to the Portland stone. It is not properly a cement, but an artificial hydraulic lime composed of a mixture of clay and chalk from the valley of the Medway; the materials are ground together under water and then dried and burned in proper kilns. Portland cement is noted for its extraordinary hardness and tenacity, but as it permanently expands in setting, must not be used when such a property would interfere with the solidity of the work.

## HANDY DEVICE FOR DETECTING GAS LEAKAGE.

A handy apparatus for detecting leakage of gas from house service pipes has been devised. It consists of a small pipe bent twice at right angles, and connected with the service before and after the main cock. A small glass bulb, partly filled with a mixture of glycerine and water, is placed on the pipe. A tube dips into the liquid in the bulb, and is so arranged that any gas passing through the small pipe bubbles through the liquid. The bulb is also provided with cocks at its inlet and outlet. If these latter are opened, and the main cock closed, and the burners shut off, any bubbles in the liquid show a leakage of gas in the pipes or fixtures beyond.

## THE ORIGIN OF THE AUGER.—An item

is going the rounds which purports to relate how the auger was discovered. According to this it would appear that in 1680 an Englishman saw some boys trying to make a hole in the ground with a piece of iron barrel hoop; after the barrel hoop had penetrated some distance it became twisted and then carried the dirt up to the surface nicely; noticing this, he invented the auger. This sounds very well until you happen to think that when the boys used that barrel hoop it undoubtedly twisted the wrong way, and instead of raising the dirt to the surface had a tendency the other way.—*Ex.*

## MORTAR THAT WILL STAND FROSTY WEATHER.

Mortar made in the following manner will stand if used in almost all sorts of weather: One bushel of unslaked lime, three bushels of sharp sand; mix one pound of alum with one pint of linseed oil, and thoroughly mix this with the mortar when making it, and use hot. The alum will counteract the action of the frost on the mortar.

## A CURIOUS BIRD'S NEST.—Near the town of

Soleure, in Switzerland, a bird's nest was recently found which was constructed entirely of the imperfect watch springs thrown out from the workshops. It has been deposited in the local museum.

## TO PRESERVE LEMON JUICE.—To preserve

the juice of lemons, mix it with one-tenth of alcohol and then bottle. By this means it will be prevented from decomposing.

**GILSONITE** from Utah is being used in the East. Fifty carloads have gone to St. Louis and Chicago from Price station on the D. & R. G. W. It costs the company \$5 per ton to mine and sack it, and \$15 per ton to send it to the railway. Sacks can be used only once, and require to be of the strongest material and double sewed. Insulators for telegraph wires, made of this material nearly two years ago and in constant service at St. Louis since then, have proven to stand well and be superior in power of insulation. But it is in paints and varnishes that the chief demand comes from. For these purposes the article promises to become in such demand as to build up an immense trade.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**BIG BAR BRIDGE AND VICINITY.**—Amador *Ledger*, April 3: We learn that some of the English people connected with the Rich Gulch (Calaveras) company have taken an interest with Messrs. Tripp and Littlefield in the old Kearsing mine, and have let a contract for 250 feet of a tunnel which will tap the vein about 200 feet in depth. The work is progressing very rapidly, and in a workmanlike manner. The prospects certainly promise good results. The Cleveland Mining and Milling Co. have completed their 5-stamp mill and tested the rock, to their great satisfaction, using rain-water from One Hundred Ounce gulch. By Monday of next week they will have their ditch connected with the Amador canal, when the mill will run without delay. A tramway 800 feet in length is completed from the old shaft to the new one. We understand that Whitaker Wright, the principal owner, will be here on or about the 15th, when it is the intention of the company to erect a new 10-stamp mill, with all modern improvements, on the site at the new shaft, and make a sinking in each shaft, also build boarding and lodging house, etc. We were shown some rock taken from the South Point mine, 1500 feet north of the Cleveland, a few days ago, which looks well and shows free gold.

**PLYMOUTH.**—*Ledger*, April 3: Plymouth is very quiet. The Pacific mine has shut down again, owing to the fire, which is still burning, and in all probability will continue to burn until the mine is flooded with water. The Cupps mine is closed down, so we are informed, but for how long a time is not stated. The Monmouth is working on good prospects. The owners are very sanguine with regard to their mine, and are talking of putting on proper machinery to work with before long. The War Eagle is taking out ore that is very rich in free gold. The owners of this snug little mine have a good thing of it, making considerable more money than if they were working for the best going wages paid to miners here. The people that left and went to other mining localities have mostly returned to Plymouth, and propose to stay here if they can get anything to work at.

**SUTTER CREEK.**—*Ledger*, April 3: The rich strike at the Wildman mine continues full of promise. The ledge doesn't seem to diminish and the rock is excellent. The company are now putting up electric lights, which will be adjusted in a few days, and will be a decided improvement on the lamp system.

## Calaveras.

**HOPEFUL.**—*Angels Record*, April 3: Mining of all kinds is looking very hopeful for good results in the various enterprises now progressing. In the Beatrice the tunnel is nearing the point where the lead will be tapped, when it is expected a valuable property will be disclosed. Two shifts are working with all speed to finish the work. In the Stanislaus district work is progressing very favorably in the different mines. Mr. Goodwin's mill is running up to its full capacity. A blast was fired in the Central hill gravel claim last week and did good execution, breaking up the bank most effectually.

**CONFIDENCE.**—*Mountain Echo*, April 4: The Confidence mine in this town, bonded recently by D. H. Jones, has been freed from water during the week, and a large force of men has been put at work. The mines of Angels have thus far only been prospected, and in a few months more the developments here will be productive of great good and astonishing results.

## El Dorado.

**MOUNTAIN PEAK.**—*Democrat*, April 3: The Hard Scabble, or Mountain Peak mine, north of Latis, a tar lying idle for the past six or eight months, has again been started up, Henry Baumbach and J. C. Trahebaugh putting their shoulders to the wheel. This mine is owned by a San Francisco company, which has already expended \$12,000 or \$15,000 and has not yet taken out a cent worth of gold. The mine has been run with a gold indicator, of which Prof. Howland is the manipulator. Mr. Howland is now in this vicinity, looking up some rich mines, which it is hoped he will be able to find.

**VANDALIA.**—*Mountain Democrat*, April 3: J. W. Kelly, superintendent of the Vandalia mine, four miles below Shingle Springs, was in Placerville on Tuesday last. This mine promises great results. The mill is kept constantly running on high-grade ore from a ledge 15 feet in width. The shaft has been sunk to a depth of about 170 feet, the ore improving and the ledge widening as they go down. Expert miners who have watched the development of this property from the first are firmly of the belief that it will prove one of the richest permanent mines in the county, if not in the State.

## Inyo.

**BORAX.**—*Inyo Independent*, April 7: At the present low prices for borax the profit on the article mined in Death valley must be very small. It has to be hauled 160 miles through a desert country where every article needed by men and animals is very costly, and where high wages must be paid to workmen. The owners of the borax beds have a very large capital invested, and the region has no other resource than this. To put borax on the free list would put a stop to the work in Death valley.

## Nevada.

**THE NEW EUREKA MINE.**—*Grass Valley Tidings*, April 7: Quietly, but persistently, work on the New Eureka mine, situated near the Hebrew cemetery, has progressed for a little more than a year and is still being actively pushed. The large, double compartment shaft is now down 250 feet and co-tracks are steadily sinking. The shaft is being sunk on what might be termed a "blind lead," for there is no ledge indicated on the surface. In sinking, patches of quartz, not veins, however, have been encountered. At present the formation at the bottom warrants high expectations, although Mr. Weldon, the resident manager, does not expect to uncover the ledge he firmly believes to exist before a depth of 300 feet is attained. With Mr. Weldon are associated Senator Walrath and John Skinner. The company propose to sink other shafts along the line of their claim, which extends west to Ben

Taylor's, when the ledge shall be uncovered in the New Eureka. For this purpose the plant now on the New Eureka will be employed and water-power used in its stead. A tunnel from the "Slide" is also embraced in the project. An instance which bears out this company's expressed and unshaken belief in ultimate success is found in the fact that a portion of the New Eureka shaft costs \$50 a foot to sink. Should the project prove fruitful, the company will engage in other like enterprises in this district, which, as Mr. Weldon remarks, "is in its first stage of development." Nine men are given employment at the New Eureka, and the company owes not a dollar.

**GRANITEVILLE.**—*Cor. Nevada Herald*, April 5: The Erie mine is owned by Frank Morse of Grass Valley. It is situated about 3 miles almost due south from Eureka South. The ledge on which the mine is located runs north and south. It is nearly vertical, having a pitch of about 80 degrees. It varies in width from 12 to 80 feet. The mine has a surface area of 600 by 300 feet. The known pay-shoot is about 300 feet in length. There is about 80 tons of rock on the dump, showing gold freely, and the rock taken from that same point last year paid \$18.50 per ton, and this will probably pay as good. There is good milling rock enough in sight above the water level to keep a 10-stamp mill running two years. The rock is crushed at a 10-stamp mill about one-half mile distant. In the course of a few days there will be from 12 to 15 men at work on the mine. The ledge is on the contact of slate with granite. The White mine is owned by Frank Whitt. It is 3 miles above Washington on Canyon creek. The claim is in area 1500 by 600 feet. The ledge runs north and south and pitches east 80 degrees. It is explored in width 20 feet; how much wider it is not known. The improvements are a shaft 40 feet deep and a tunnel 107 feet, and about 70 feet more to run to reach the shaft. The whole formation will pay from \$5 to \$7, and there is good water-power belonging to the mine.

**NORTH BLOOMFIELD.**—*North San Juan Times*, April 6: The great hope of this place is that the Last Chance drift mine, owned by R. D. Skidmore and others, will turn out well. A shaft is at present being sunk to strike the lower stratum of gravel. A large amount of money has been expended thus far on the mine. It has been stated that rich gravel had been struck in the Last Chance recently, but at last accounts this was said to be a mistake. It will take some time yet to determine the character of the mine. This mine lies in the direction of Relief Hill, about 2½ miles from North Bloomfield.

**DERBEC.**—The Derbec mine, under the intelligent management of Mr. Galavotti, has about 80 men at work. The mine has been closed two months or more, but again resumed work about three weeks ago. Drifting is being pushed forward day and night in very good gravel. William M. Davis, an old San Juaner, is foreman. We have no report from the Delhi mine in relation to the March run. All we know is that the usual dividend of \$10,000 was declared and paid. The General Grant mine is looking up. Good, rich rock has been struck in the upper tunnel. The owners of the Grant are very much encouraged with the prospects.

**RICH QUARTZ LEDGE.**—*Tidings*, April 6: Of the ore taken from Chas. Hegarty's quartz claim at or near Moore's flat, sufficient can daily be reduced in a hand mortar to defray all expenses of working the mine. A gentleman who claims to know where of he speaks is our authority. Mr. Hegarty is now in San Francisco for the purpose of making arrangements for developing the property on a large scale.

## Placer.

**MAYFLOWER.**—*Placer Republican*, April 4: The last news from the Mayflower mine is that the drift to find the pitch of the rim is in over 115 feet. The bedrock was lost at 68 feet, but they will run in gravel 36 feet, and sink a winze which will probably reach the center of the channel. After that work is done the tunnel will be extended to that point and the chute built. The new mill is progressing, the engine and battery rooms being covered last week. The Live Oak continues to look well. They have found the blue gravel which was lost several months ago and which was paying \$4.25 a ton. The Live Oak mill is running.

## Shaft.

**FRENCH GULCH.**—*Shasta Courier*, April 7: John Morrell & Co. are opening up their mine in good shape and the prospects recommend it. Some capitalists are after it with a sharp stick. One cleanup of the other new mine only turned out \$80 per ton.

**PROSPECTING.**—*Shasta Courier*, April 7: During this spring, summer and fall, French gulch and other districts in this county will be so thoroughly prospected, especially on the surface, that a mineral-bearing quartz ledge will have a slim chance to escape location.

## Sierra.

**KEYSTONE.**—*Sierra Tribune*, April 6: M. H. Mead has 25 men employed at the Keystone mine. The 20-stamp mill has been put in good repair and it will be started up in a few days. It is stated that there is enough good ore now in sight in the mine to supply the mill for at least a couple of years. In the meantime another level is to be opened out. The working of this mine will aid the interests of this section a great deal.

## Trinity.

**JUNCTION CITY.**—*Cor. Trinity Journal*, March 31: Junction City, situated at the junction of Canyon creek and Trinity river, is one of the many mining towns yet surviving the early excitements. The different mines are (commencing at the southern extremity of the district): Mr. Joe Ham's, situated on the west side of the river; the mine is supplied with water from Johnston creek. A Chinese company on Lang's Bar, worked by the waters of Dutch creek; the mine employs 18 or 20 men and has been worked for 20 years or more. Alex Carr's mine on Evans' Bar is at present the only mine being worked. Soldier Bar (Chinese company) mine, supply of water from Dutch creek; number of men employed, 8 or 10—said to pay very well. The Chapman and Fisher mine next comes in order. The supply of water is from Soldier creek. This mine is well fitted up with all modern machinery, and a vast amount of earth is removed each year. Mrs. Jane Gribble runs the mine adjoining Chapman and Fisher's; water furnished by Davis gulch; from all reports this mine is the richest on the river, but the water supply is very limited. The Post mine on the east banks of the river is very little worked; it is said to

be a good mine. Sheridan Bros' mine, which gets its supply of water from Simpson's creek, has been worked for a number of years on a paying basis. The Uncle Joe Sturdivant, on the west bank of the river, takes its water supply from Mill creek. All modern machinery in shape of large pipe and giants are used, and a tunnel some 400 feet in length, through solid rock, was completed some time since for the purpose of gaining sufficient fall and dump; the mine is in good working condition. Mr. Fred Haas is steadily running a 15-inch pipe at his mine. He takes water from Clear creek, and is digging a new ditch for the purpose of working some high ground that the old ditch does not cover; about 8½ miles of the ditch have been completed. The John Whitmore mine, which is the bed of Oregon gulch, has a large compartment flume in the gulch which he extends as the tailings are removed; it will in all probability prove a success in time. The next in order is Hayes' Red Hill Gold mine. This is in reality a group of mines. The water supply is taken from Canyon creek. The mine is the largest in Trinity county and immense sums of money have been expended in bringing it to its present state of perfection. The finest suspension bridge in Northern California carries the pipe across Trinity river to the mine; 18-inch pipe is used with a capacity of about 1400 inches of water. The Segalia mine receives water from Canyon creek. The water is brought across the river in pipes over a suspension work built last fall. David Evans' Red Hill mine is supplied with water from Connor creek. Mr. Evans works quite a number of men. Mr. Henry Jacob's mine comes next; it is worked by tunnels, the main tunnel being some 600 feet in length; it is undoubtedly one of the best mines in the county and is in shape to take out a large amount of bullion. The past season has been a poor one; although a large amount of water has fallen, it went off quickly and the chances are not favorable for a wet spring.

**JUNCTION CITY.**—*Cor. Trinity Journal*, April 7: First, we will take the busy little town of North Fork, or Bagdad, as it was called. Of its earlier history we shall say nothing except that at one time it was one of the most thriving of our northern towns, and promises to be again, as the East Fork mines are developed. The wagon-road, leading to the mines, is finished about two miles above North Fork. On the hill overlooking North Fork is the Rittsburgh mine, worked with water from North Fork gulch, now worked and owned by Chinese. Crossing the river, we next come to the Miller mine, owned by Mr. Miller; this mine is a good one but with a limited supply of water from Fobbles gulch. The Idaho Bar mine is worked by Chinese. The Stoddard mine is not worked now, but there is a large ledge of ore in the mine; a 50-foot tunnel has been run, which did not pass the ledge. It may in time be one of the largest quartz ledges in the country. The owners, Lorenz & Leibbrandt intend prospecting it more. The elevator at the McGillivray ranch, owned by Lorenz & Leibbrandt, is elevating the water and dirt 49 feet. This mine is worked with water from Canyon creek. The Mammoth placer mine in the Red Hill district owned by the same parties, is worked with water supply from the Connor creek. John Waldron is running a drift close to the mouth of Canyon creek. The Pratt mine and the Thomson mine are both small mines at the mouth of Canyon creek. The old Mortzuma mine, opposite Junction City on the other side of the river, is owned by Oscar Laws; the water supply is insufficient.

**EAST FORK.**—*Trinity Journal*, April 7: Mr. J. G. Trotter, who has just returned from the East Fork mines, expresses himself as well pleased with the prospects and thinks everything favorable for a good camp in the near future. At present 3 arastras are running; Day & Moor's, Enterprise Co.'s and Bergins'. There will probably be a large influx of prospectors this summer and large developments are looked for. The wagon-road which will be completed this summer will give parties visiting the mines an opportunity to conveniently reach their destination.

## Tuolumne

**QUARTZ.**—*Sonora Democrat*, April 6: Mr. Sharwood of Soulsbyville reports a genuine mining boom up there. Messrs. Oaks & Shaw have fine prospects for a pocket on Shaw's flat hill. The Platt and Gilson mine at Soulsbyville is two feet wide, and pays steadily right along \$50 per ton. It is reported that the Riverside mine, nine miles above Columbia, is about to have a 20-stamp mill built on it. The Black Oak mine of Soulsbyville has a splendid chute—two feet in width, and is richly rewarding its owners. The mine of Mr. M. Byrum, at Rough and Ready, under the supervision of Mr. McGinn, is, we are told, doing well. The main shaft is down about 60 feet, and the quartz is of good character. In consequence of the mining and general activities in and around Soulsbyville, that village is fast becoming a thriving settlement.

**GRAVEL.**—*Tuolumne Independent*, April 7: A rich mining strike in gravel was made at American camp last week by Mr. Newcomer. From the surface to about eight feet in depth the yield of gold is large, \$8 and \$10 to the pan having been obtained. From a place about six feet square \$200 was taken out.

**GOOD ROCK.**—The Platt and Gilson mines, consolidated, are getting out very good rock. The new hoisting works are in splendid order and the mine is being rapidly developed. The future of the property is most encouraging to all concerned. Parties from below, who are interested, have recently paid the mine a visit and express themselves perfectly satisfied with the outlook.

## NEVADA.

## Washoe District.

**CONFIDENCE.**—*Virginia Enterprise*, April 7: The joint north drift run by the Confidence and Challenge on the 1200 is in 117 feet having advanced 35 feet during the week. Shipping daily to the Brunswick mill 175 tons of ore, the pulp assays from which average \$39 per ton.

**SAVAGE.**—On the 400 level the south drift has been advanced 18 feet. In the north drift have in place the 16th sill floor set. On the 500 level the started main west drift from the new station. The south drift from the 600 level upraise that is to come up with this drift is advanced 48 feet. West drift 800 level has been extended 25 feet. West drift 950 level, has been advanced 38 feet, making its total distance 312 feet. Are extracting ore from the

several levels between the 400 and 900 ft. levels, and are shipping to the Rock Point mill 60 tons per day. Battery samples average \$26 per ton.

**HALE AND NORCROSS.**—From the south drift, 400 level, are shipping out ore of good quality. On the 700 level all the stopes are looking well and yielding the usual quantity of good ore. During the week have hoisted 1530 tons of ore and have shipped to the Nevada and Mexican mills 1355 tons, the average battery samples being \$35 per ton. Have bullion on hand and previously shipped amounting to \$150,000. Have not yet received full returns from the mills for the March crushing.

**GOULD AND CURRY.**—Have extracted 85 tons of fair-grade milling ore during the week from the 250 and 300 levels, which has been stored in drifts. On the 1300 level the west crosscut from the end of the main north drift has been extended 47 feet; total, 134. The formation is porphyry with streaks of clay.

**BEST AND BELCHER.**—On the 425 level upraise No. 2 near the north line has been carried 28 feet; total, 58. The formation is clay, quartz and porphyry. Fifty feet south of this upraise have cut out a station and will start to sink a winze in some good-looking quartz there that shows value by assay.

**OCCIDENTAL.**—In the upper tunnel south drift, 50 feet from No. 1 upraise, the west crosscut has been extended 4 feet; total, 25 feet. Fifty feet from the same upraise the east crosscut has been advanced 7 feet. The north drift: the top of No. 1 upraise has been extended 10 feet; total, 41 feet.

**CHALLENGE.**—The raise commenced during the week from the Confidence raise has been continued a distance of 20 feet on the slope. The Jack Challenge joint north crosscut is in 25 feet. It is run from what is called the north lateral drift.

**CROWN POINT.**—The 400 level winze is down 65 feet, the first 40 feet being vertical and the last 25 feet on the slope to the south. The bottom is in good ore. The 500 level east crosscut is now in 218 feet, the face being in clay and porphyry.

**CHOLLAR.**—North drift No. 1, 550 level, is in 320 feet. Average assays from this drift the past week were from \$25 to \$30 per ton. The west drift from the north drift on the 450 level is now in 92 feet in quartz of low grade.

**ALPHA AND EXCHEQUER.**—Are working on the 422 and 222 levels of Exchequer, and on the 382 level of Alpha. Are chambering for a winze 100 feet north of the Alpha shaft where there is a good prospect for ore.

**BELCHER.**—The 500 level crosscut is now in 218 feet in clay and porphyry. The north drift has been advanced 30 feet; total, 48 feet. The face is in quartz and clay, the quartz assaying from \$4 to \$20 per ton.

**ALTA.**—Are hoisting and concentrating about 30 tons daily. It comes from the 825 and 1150 levels. Have over 1500 tons of ore extracted and stored in drifts and on the dump.

**KEYES.**—The south drift on the 240 level still continues cutting rich strata of ore, which are striking toward the heavy body of quartz lying on the hanging-wall of the vein.

**BALTIMORE.**—Last week some of the pumping machinery broke down, but it was soon repaired, and are again driving the north drift on the 350 level.

**UTAH.**—The incline upraise on the 472 level has been carried 10 feet; total on the slope, 133 feet. From this point are cutting out a station.

**ANDES.**—Driving a little north of east on the 350 level, and north on the 240. This upper drift has some good quartz coming in.

**IOWA.**—The McBee tunnel has been advanced 12 feet during the week, cutting through some favorable-looking quartz and clay seams.

**SCORPION.**—The south drift on the 300 level has been advanced 18 feet, being all the work done in the mine the past week.

**WEST CON, CAL.-VA.**—Shaft making good progress and sinking in vein quartz, giving some assay values.

**SEGREGATED BELCHER.**—The south lateral drift was advanced 18 feet during the week; total, 284 feet.

**POTOSI.**—The south drift on the 550 level is in 360 feet. The face is in quartz, giving low assays.

**YELLOW JACKET.**—Are shipping 100 tons of gold-bearing ore daily to the Santiago mill.

**BENTON.**—Are still drifting on the 725 level, with no new development yet to report.

**LADY WASHINGTON.**—Upraising on the 725 level, and are now up about 210 feet.

**BULLION.**—Are sinking the winze on the 500 level.

## Aurora District.

**THE DURAND.**—*Esmeralda News*, April 7: The owners of the Durand mine say that the mine never looked better than it does at present. About 300 tons of ore were recently worked at the mill, from which two bars of bullion, valued at \$18,000, were shipped to S. F. last Tuesday. The owners expect to have their new steam pump in operation by the first of May, when they will be able to work on the rich ledge of ore known to exist at the bottom of the main shaft. Ore taken from below the water-line, and which was tested, went 50 cents a pound. As soon as the water can be pumped out and the mine put in working shape, a larger force of men will be employed and the mill kept in constant operation. It is understood that men will be put to work on other mines in Aurora.

## Eureka District.

**ORE SHIPMENTS.**—*Eureka Sentinel*, April 7: During the past week ore shipment, were made from the mines of the district as follows: To the Eureka Co., Silver Lick mine, 19 tons; Dunderberg, 19 tons; Secret mine, 1 ton; Paul Pry, 4 tons; Frazer & Molino, 4 tons; Martin Horton, 3 tons. Richmond Company—Phenix mine, 53 tons; Jackson, 63 tons; Dunderberg, 50 tons; Silver West, 1½ tons. We learn that 250 tons of bluish ore has accumulated in the Ruby Dunderberg mine during the winter, which will be shipped to the furnaces as quick as Broys' teams can haul it. Five hundred tons of speiss has been taken from the Eureka Co. dump during the time of overhauling the reduction works, the resmelting of which will commence as soon as operations will be resumed.

## Gold Run District.

**ADELAIDE COPPER CO.**—*Silver State*, April 5: Messrs. Roulstone & Bates, two experienced smelt-

ers, a few years ago purchased a copper-bearing lead ten miles from Golconda. They recently commenced developing the mine, which they incorporated under the name of the Adelaide Copper Co. The lead is favorably situated on a slope of the mountains, with a good natural road from the railroad at Golconda to the mine. They sunk a shaft 35 feet deep on the lead, from the bottom of which they are now crosscutting, and have run 25 feet across the ore body without reaching either wall, the shaft and drift being in ore. There is a streak of ore averaging 15 inches wide that carries over 60 per cent copper, and which is literally covered with flakes of native silver. Assays of the ore outside this streak gave \$50 in silver and \$34 in gold to the ton. The company is building a water jacket smelting furnace of 40 tons capacity at the mine. They intend to use coke in smelting, which will cost them, delivered at the furnace, about \$20 per ton. There is plenty of water at the mine for smelting purposes, and plenty of ore in sight to supply the furnace for an indefinite period, and in a few weeks copper bars, rich in gold and silver, will be one of the regular exports of this country.

#### Garfield District.

**ATHERTON.**—Esmeralda *News*, April 7: A new ore chute has been put in at the lower tunnel of the Atherton mine. It is calculated to hold about 150 tons.

#### Hawthorne District.

**PROGRESS OF DEVELOPMENT.**—Esmeralda *News*, April 7: As the mines of Hawthorne district are being further developed, larger and richer veins of ore are being encountered. There is one peculiarly different character of ore that is to be found therein. One man may go out in the district, locate a claim and in a short time open up a valuable gold mine; another man will take off a claim adjoining No. 1 on the south, and after a little work will strike a well-defined silver ledge; then again No. 3 will risk his luck on a prospect adjoining No. 1 on the west, and the chances are favorable that he will discover a ledge of lead ore that will work 70 per cent. Then comes No. 4; he will take up a claim adjoining the first named on the north. After a few months' work he will be hauling tons of copper ore to town to be shipped for reduction. The next man will work on a prospect in the district, and before a great while he will be taking out ore that will average him \$30 per ton in gold and 40 per cent lead. Therefore, it is to be seen that when a prospector starts to work he is not certain whether he will strike a gold, silver, lead or copper mine, or whether he will open up a ledge containing a percentage of each of the above minerals. Nevertheless they are willing to take their chances, as is shown by the number of leases taken on prospects within the past month.

#### Moss District.

**COPPER.**—Esmeralda *News*, April 7: S. A. Knapp and Johnny Warner have 4 men now at work on the Black Prince mine, and are extracting very rich copper ore. They have now about 40 tons of ore on the dump.

#### Seligman District.

**NOTES.**—Eureka *Sentinel*, April 7: The Crusader mine is looking away up. Thirty more experienced miners are to be put to work immediately. Several men will be set to work in the Dead Broke mine as the spring advances. The ore in the tunnel and 40-foot levels of the Purcell mine is improving in quality. The concentrating mill and works at Seligman are rapidly approaching completion, and will probably be ready to start up in two or three weeks. The vein of the Purcell series of mines crops out for a distance of 600 feet in place of 6.0 feet, as has been erroneously stated heretofore. The north and south incline shafts on the Purcell No. 2 mine have been connected by a drift all the way in solid ore from 3 to 8 feet thick. The drift is 160 feet long, and is on the 90-foot level. The laboratory concentrator lately received here has been put in operation to test the dry process of concentration on the ground, as well as to experiment on sizing of the ore from the Purcell mines, and the success of the mill, when it starts up, is assured from the fact that from each trial only \$1.50, or thereabouts, was left in the tailings.

#### Tuscarora District.

**BELLE ISLE.**—Times-Review, April 6: North drift on east lateral from No. 1 crosscut east, 250-foot level, extended 10 feet. The stopes have yielded their usual amount and grade of ore.

**COMMONWEALTH.**—150-foot level: An upraise was started from No. 1 south drift 100 feet south of main shaft and passed through ore 10 feet, the top of raise being still in ore assaying \$26. South drift was stopped on account of the upraise, but will be started as soon as the hanging wall side of the ore is reached. No. 2 south drift has been extended 11 feet; total, 47 feet. East crosscut from the north drift has been advanced 14 feet. This crosscut was dry when run, but began to swell for a distance of 50 feet back from the face. Timbers were put in as quickly as possible, and just in when the water broke in 30 feet from the face; this relieved the pressure and is drawing the water from the upraise. No work has been done in this upraise since cutting the ore, as there was so much water. A crosscut has been run from south intermediate drift, south of the shaft, and has cut into the same high-grade ore as that north, and ore now being extracted from this point will go over \$500 per ton.

**NORTH BELLE ISLE.**—North intermediate drift from No. 1 winze, 150-foot level, extended 9 feet. The ore is wider than the face of the drift and two feet of it is very high grade. This drift will reach the Nevada Queen line in a few days. No. 1 upraise, 70-foot level, extended 7 feet. The stopes on the 300-foot level are looking well. The usual quantity and grade of ore has been sent to the mill and stored on the ore dumps.

**NEVADA QUEEN.**—350-foot level: North drift on the east vein has been advanced 23 feet, in low-grade ore. A crosscut is being run toward the footwall, from a point near the face of north drift. The ore improves some as the crosscut is advanced. The upraise has been extended up 10 feet, all in very rich ore. Chutes were put in as well as air pipes, and better progress will be made.

**PONDERA.**—Since last report fair progress has been made all around. In north drift the end of crosscut has been advanced 5 feet; ledge hard and of low grade; are not saving it at present. Started this drift on the first of the present month. South

drift from shaft No. 2 advanced 6 feet. Are taking out some high-grade ore. The ledge is getting larger and of a lower grade of chloride.

**FOUND TREASURE.**—South drift, 150-foot level, has been extended 8 feet, the face showing good ore in disintegrated quartz. Upraise No. 1 has been carried up 10 feet, and will connect with the drift on the 100-foot level during the coming week. Upraise No. 2 has been carried up 10 feet; total, 30 feet. Both raises continue to yield high-grade ore from their faces.

**NAVAJO QUEEN.**—North drift from west crosscut, 200-foot level, has been advanced 16 feet. The ledge has increased in size to 6 feet. On account of the increased width of ledge the ground has to be timbered. Everything running smoothly.

**GRAND PRIZE.**—An upraise has been started from the 300-foot level stopes. The vein continues up strong and shows splendid ore in the top.

#### ARIZONA.

**VARIOUS CAMPS.**—Prescott *Journal-Miner*, April 7: G. W. Murray is hauling ore from the Bigges mine to the sampling works. E. E. Wann, superintendent of the Elita mine, left for Cherry creek today. Ten carloads of ore have been shipped from the sampling works since last Friday. Geo. Rhoepeter has sold one-half of the Lone Pine mining claim. Big Bug, to R. H. Burnister. Robert Schofield made a cleanup a few days ago at his Big Bug mill, getting a good-sized bar of gold bullion. Dunstuckton has sold one-third of the Morning Star and Columbus mines, Big Bug district, to Dr. R. K. Robinson and F. H. Taylor. Messrs. Berrington & Harlan came in today with a bar of gold bullion from the Howard mine, making the second one within two weeks. George Merwin is said to have made a strike in the Dosoris recently, and has nearly a carload of \$400 ore ready for shipment to the sampling works. A miner, just in from the Congress mine, says the ore at the bottom of the shaft 240 feet deep, is richer and a wider body of it than at any other point. A carload of mining machinery came in yesterday, consigned to N. C. Shekels, superintendent of the Crowned King Mining Co. It will be followed soon by two more carloads. The shaft in the Congress mine is now down to a depth of 220 feet. There is a larger and better body of gold sulphurets at the bottom of the shaft than at any point in it. Eight tons of ore are now en route and will arrive at the sampling works tomorrow from this mine.

**NEW GOLD LEDGE.**—Prescott *Courier*, April 4: Jones' ten-stamp mill is doing quite well. Its manager has put a force of men at work in a new gold ledge near Mr. Barrington's house. Bank of Arizona has just shipped a \$2000 bar of gold for Harlan & Barrington. Mr. Prout, superintendent of Copper Basin, is pleased with developments. A great many miners outfit in Prescott yesterday. Mr. Cockburn, having recently returned from San Francisco, has definitely started the Arizona Sampling Works for the summer's business, since which time four carloads of ore from the Bogges mine have been run through, sampled and shipped; two carloads from Diamond Joe's Congress mine; two carloads from Moore & Doggett's Amulet mine; one carload from the Blue Dick and two mixed carloads from surrounding districts.

**TOMBSTONE.**—Epitaph April 7: Rich ore is being extracted from the bottom of the 70-foot shaft in the Southern Cross adjoining the Ground Hog. Chlorides have struck good ore in the Hard Up mine. The difficulties over the Telephone mine have been amicably adjusted. A contract has been let for a hundred-foot shaft on the Hidden Treasure, now down 35 feet in ledge matter. This week a new double compartment shaft was started on Mammoth ground to tap the large ore bodies developed below by drift in the Bunker Hill. Although every effort has been made to keep quiet the recent discovery of coal in the Chiricahua, yet enough is known to warrant the statement that coal exists there in considerable quantities. Another Cochise county resource, Rich ore was this week brought in from Morrison and Carr's claim near Atlatope springs. Quite a number went out to the strike this week and many new locations were made. Late reports from the Whittines state that the ledge has not yet been cut in the drift from the bottom of the 40-foot shaft in the South American mine, yet indications are favorable.

#### DAKOTA.

**IRON HILL SMELTER.**—Deadwood *Pioneer*, April 7: Supt. William E. Tehune of the Iron Hill smelter was in the city yesterday. The smelter has again shut down, after a run of 12 days, during which 400 tons of ore was treated. The principal portion of this ore was drawn from the Iron Hill, though other mines also contributed. The Spanish R supplied 40 tons of very excellent quality. The condition of this property is steadily improving, and more ore is now available than at any time since it has been worked.

**FLOAT.**—Thomas H. Whit, owner of the Snow Storm mill, reports that he expects to have the building erected on its new site and machinery placed within the next six weeks. Stamps will begin dropping not later than June 1st. The plant will do custom work, operating principally on ores of mines situated in Whitecloud gulch.

#### COLORADO.

**IDAHO SPRINGS.**—News, April 7: During the first quarter of 1888, ending March 31st, there were shipped to Denver from the station at Idaho Springs, 5,294,600 pounds of ore. Hubert McCoy shipped a lot of Argo ore to Denver this week. Few people are aware that within a few miles of this town is a mine of uranium of considerable value. Books & Co. are taking out a lot of fine-looking smelting copper from their tunnel, about one-half mile up Trail creek. Bell, Redd & Co. continue to show large quantities of heavy ore in the Salisbury. Mr. Morris made a 3-ton shipment from the Indiana, on Chicago creek, on Tuesday last. The ore ran very well in gold. J. C. Simmons has secured a lease of the Fraction mine. There is more ore being hauled down Chicago creek this spring than ever before. Most of it is coming from Cottonwood gulch. The Homestake up Chicago creek is looking splendidly. Some of the leasers on the Cincin-

nati up Gilson gulch have fine bodies of ore. Jim Eart & Co. are leasing on the Ship Ahoy, beyond Gilson gulch, and have one of the finest streaks of ore in that section. Electric lights are now being placed throughout the Mayflower mine. In sinking the main shaft of the Yamartine this week, an eight-inch streak of rich ore was encountered. The Freeman is turning out lots of low-grade ore. Old Seaton still holds her own. The Tropic, Casino, Victor, Kangaroo, Crystal, Metropolitan, Sarti Fe and other lodes are producing good ore. The Mountain King mine in Spring gulch started up on Monday. Contractors are driving the main tunnel on the Gen. Taylor an additional 105 feet. Lewis & Stansbury have discovered a neat little well-defined vein, carrying yellow copper and mill dirt. This lode is on the north side of Clear creek, between the mouth of Banner creek and Mill City.

#### IDAHO.

**FROM SMOKY.**—Wood River *Times*, April 4: A gentleman just back from Smoky says that the whole region generally is looking very well. At the Carrie Leonard the deep tunnel is being driven right along, while the stopes in the upper levels are showing considerable ore. At the Silver Star the shaft is still going down in good ground, and another level will soon be opened, when the mine and mill will be worked with a full force. At the King of the West the 400 level is being opened up, and shows considerable ore. At the Tyranny there are large ore bodies exposed, but the miners are devoting all their attention to making an upraise, which will thoroughly ventilate the mine. The Dollarhide group is supposed to be sold to English parties. At the Galore stormy the deep tunnel is in about 350 feet, with about 150 feet to run.

#### MONTANA.

**BONDED FOR \$100,000.**—Inter-Mountain, April 4: To-day a bond was filed for record in the county clerk's office, whereby Thos. Couch received a six months' bond upon the Harris Lloyd tunnel property, including the Pennsylvania, Johnson, and Little Ida lode claims, and a part of the Rnb Roy. The consideration named is \$100,000, half of which is to be paid at the expiration of six months and the other \$50,000 within 90 days thereafter. Mr. Couch agrees to put at least four men at work within 30 days, and has the privilege of putting as many at work as he wishes to. All ore extracted is to be held until the expiration of the bond, when its value may be applied upon payment of the bond, but if the deal is not made it shall all revert to the person giving the bond.

**A NEW DISTRICT.**—Montana *Mining Review*, April 4: Late year there was discovered near the well-known Elkhorn mining district, a new district at the old camp of Dogtown. The majority of claims located are in black limestone, the ores being galena, assaying on an average about 40 ounces silver to the ton and 50 per cent lead, besides carrying gold as high in some samples as \$30 per ton of ore. The veins show at the surface as thin seams or stringers, but a little development work shows them to be large, workable leads capped by the limestone, through which the ore protrudes in the shape of stringers as stated. The Helena, Boulder Valley and Butte railroad, running within five or six miles of the new camp, will undoubtedly insure the early and thorough development of the latest addition to Montana's already numerous array of wealth-producing districts.

**AMONG THE LEDGES.**—Phillipsburg *Mail*, April 3: John C. King, a mining operator of Chicago, is visiting James K. Pardee and taking a look at the prospects of Phillipsburg and vicinity. From the Silver Chief, the property of the Hope Mining Co., a test shipment of five tons to the Phillipsburg sampling-mill has just been made. The Hattie lode, in Dunksberg district, has encountered in the shaft at a depth of about 100 feet, two feet of high-grade silver-bearing galena. We understand this property is in process of incorporation. The Bi-Metallic continues shipments of smelting ore at a rate a little in excess of one carload a week, and without having any information concerning development and prospect we learn from authentic sources that everything is looking extremely well. Nothing definite can be learned concerning the location of the new Granite mill. The results of the numerous recent surveys have been forwarded to St. Louis, but nothing has as yet been heard from them.

**COMBINATION.**—In the tunnel on the Royal Bounty in crosscut No. 2, 150 feet from the tunnel mouth, another strike has been made of five feet of high-grade ore, much of which is free milling. This is part of the same ore body developed by the first crosscut and is known now to be of considerable extent. The mill will start to work about May 1st.

**WEST GRANITE.**—The Butte crosscut is in 535 feet in good working ground offering no obstacles to fair progress. In the east drift at the 400-foot level of the Rattlesnake the header is again widening and filling with very promising looking vein matter. While the water remains the same and gives no trouble, the work is being somewhat retarded by bad air. This, however, will be remedied as soon as air pipes can be put in.

#### NEW MEXICO.

**DEVELOPMENT WORK.**—Silver City *Enterprise*, April 9: Harvey Whitehill is one of a party of prospectors now out looking for the Adams diggings. The mine where tellurium was found by Haskell is only half a mile from Pinos Altos, and had long been worked by parties who did not suspect that it contained tellurium. The Bremen mill has shut down awaiting the arrival of quicksilver. A lot of ore from the Young Man mine was being worked which carried manganese sufficient to flour the quicksilver, considerable of which floated off and was lost before the character of the ore was discovered. James Doan this week sold ten tons of gold ore from his Dallas mine in the Burros to Crawford & Milstead. A sample was taken of a part of the ore which averaged \$50. Dave Tullock of the same camp also sold four tons to the same parties, which sampled \$40 per ton. Six men are being worked on the Last Run mine at Gold Hill. The ore is very rich in ruby silver, and has widened from 4 in. on the surface to 11 at the present depth. It is the first regular vein of ruby ore discovered in this section. Many new mines are being opened up at

Pinos Altos, and several deals of minor importance have been made recently. Four mills are running on ore. Some changes are being made in the Bell & Stephens mill, but it will be running again in a few days. The Deep Down mill will be running in a few weeks, making 6 mills in the camp, none of which will lack for ore. A partial cleanup was made in the Bell & Stephens mill Sunday last and something over \$7000 in retort was turned over to the Key manager.

#### OREGON.

**OUR MINES ABROAD.**—Bydrock *Democrat*, April 7: Never before in the history of Eastern Oregon have her mines been so thoroughly advertised abroad as we find them now. Letters from this section, many of them lengthy and fairly descriptive, are published every week by the leading journals of the State, while now and then we are favored with a complimentary notice of the same from some far-off Eastern paper.

**A GOOD SHOWING.**—There is but little doubt that a transfer of the valuable Cracker creek mines to a syndicate of Eastern capitalists will soon be a matter of record, consideration as named, \$1,000,000. These mines are located in Baker county, yield an assay of \$100 in gold to the ton, and possess every appearance of being inexhaustible. Of Mr. Bourne's recent visit to the camp, when he was accompanied by a representative of the syndicate above referred to, the Portland *News* says: "Jonathan Bourne, Jr., from the Cracker Creek mine, reports that there are some 1600 tons of rich ore on the dump. The north drift is in 320 feet and the south drift 230 feet. The exploration shows already an ore chute for a distance of 675 feet."

#### UTAH.

**REVIEW.**—Salt Lake *Tribune*, April 6: The bullion report for three months of the current year (exclusive of all ores) is as follows: January, \$327,141.43; February, \$285,687.79; March, \$283,263.98; total, \$896,093.20. A number of operators make no current reports, and are of course not included in the above. The Ontario product for the month of March was of bullion, 91,984.70 fine ounces; ore sales, \$8767.11. The regular monthly dividend of 50 cents per share, \$75,000, was paid on the 31st, making \$225,000 for the three months of this year, and the total dividends to \$150,000. The Daily output for March was 90,622.57 ounces of fine bullion; ore sales, \$12,110.92. Dividends Nos. 12 and 13 were paid on the 31st, being \$12,110.92 a share, or \$75,000. Total dividends to date, \$450,000. The receipts in this city for the week ending the 4th inst., inclusive, were to the aggregate value of \$125,759.14, of which \$93,304.45 was bullion and \$32,454.69 was ore. For the week previous the receipts were \$106,854.71, of which \$80,789.36 was bullion and \$26,065.35 was ore. The Ontario product for the week was 42,322 fine ounces of bullion; no ore sales. The Daily output for the week was 17,615 ounces of fine bullion; no sales of ore. The Horn Silver keeps up its small operations and its silence. Fine bar receipts in this city for the week were to the value of \$59,936.97. The Hansner smelter produced for the week, \$18,275 in bullion; the Germania, \$15,089.48.

#### WASHINGTON.

**TERRITORIAL NOTES.**—Stevens Co. *Miner*, April 3: The Old Dominion mine is working a full force of men. Reports say the mine is looking far better than ever before. Several owners of properties on Bruce creek are doing their assessment work in that district. It is reported that work will be resumed on the Young America at an early date. The mine can give employment to 30 men. There are some large ledges of iron on Narcise creek, which will pay to work for the gold there is in the rock, upward of \$20 per ton having been returned by the assayer. John Koon is back from a two weeks' prospecting trip up Mill creek, where he claims there is a rich mineral field. A larger amount of work is being done on mines in Chewelah district than ever before. The Eagle mine is producing the bulk of the ore which will be shipped, and it is reported that they will ship to Colville. The smelter started up again last Tuesday with a present run of ore on hand. It is probable that when the present supply has been worked, arrangements will be made by which another month's run will be on the yards. Evan Johnson, who has been prospecting on Mill creek, brings in the news that he has made a discovery of mineral in that section on that worth big money and he will show up a silver mine there before many months. Dan Clarke and Tommy Bruhl came in from the Little Dalles district last Saturday evening, where they have been at work on the Excelsior mine. They have a splendid mineral showing and a high-grade class of ore in the mine. Harry Mumm came up from Spokane Falls last Friday, and has bled himself away to Bruce creek, where he will commence work on the Agnes and the North Star. The Agnes is a fair prospect, but the North Star has six feet of facing in galena. Henry Earne came down from his iron mine, on Clugston creek, last week. He has shipped up about 100 tons of iron from the surface. The ledge is fully 25 feet in width, and two shafts of 12 and 14 feet, respectively, show a strong indication of hard carbonaceous lead over which iron appears to be a capping. It is a sure thing that a liberal expenditure of capital on this property will develop a veritable bonanza in silver. Wm. Clousey came in from Ososyoos lake again this week on one of his regular trips. He stopped at Rock creek on his way out, and found that camp to be full of the right kind of life and everybody delving deep down into the earth for precious gold, and plenty of it. Big capital has become interested in these mines and is exerting the proper force to show up what is in them. Miners are flocking to the mines in great numbers. On his way out Mr. Clousey says he met no less than 20 parties, in one day, bound to the Northern El Dorado. In the Summit district there are several good prospects, a good mine, the Daisy, a thought a district was never half prospected. A thorough inspection is therefore necessary to prove the real value of that locality. In speaking of the Daisy, it has by far the large ore-producing capacity of any mine in the Colville country, and in real value in dollars and cents it will overshadow any other two or three properties in the Territory. We are informed that work on this mine will be resumed soon which will be an event of much interest to the camp.

THE

DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to supersede the old stamp in mills of the largest capacity.

TATUM & BOWEN,

34 and 36 FREMONT STREET, SAN FRANCISCO, CAL

Manufacturers of Mining and Sawmill Machinery, Engines, Boilers, Etc.

THE RAND DRILL COMPANY,

23 PARK PLACE, NEW YORK,

Are now so situated with their new works as to offer to the miners of the Pacific Coast small Air Compressing Plants at such prices that almost any small mine can afford to put in power drills if they have none in use.

By their new and patented systems (by which the duty or performance of drills is not reduced with use) it is no longer necessary to buy a Compressor of double capacity than the drills are expected to require, in order to keep up the supply of air necessary on account of the wear of drills and compressor.

Besides having the newest and lightest designed small drill plants, the Rand Drill Company, as is well known, has built, and is now building, the largest Compressor plants in this country, and has patterns for all sizes up to 40-inch diameter of cylinder.

In respect to capacity in speed of drilling, perhaps it is in order to say that in every authoritative contest for speed yet initiated, the Rand Drills have, without exception, been victorious. This fact, coupled with another important one, that the drills use much less air and cause less repairs, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained them from the California market no longer exist, they are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor now being built for the Anaconda mine in Montana.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and

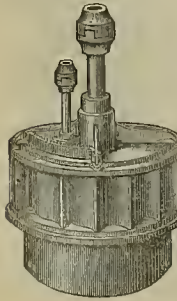

GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco.

# JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

# PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

**POWERFUL OPPOSING CURRENTS**

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

**10 TO 200 TONS PER DAY,**

Including a Sectional Steam Boiler supplying all the power required.

**PNEUMATIC PULVERIZER COMPANY,**

## List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey &amp; Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey &amp; Co.'s Patent Office Library, 270 Market St., S. F.

FOR WEEK ENDING APRIL 3, 1888.

- 383,416.—DEVICE FOR CLOSING PURSES—Emilie N. Ames, S. F.
- 380,473.—BED-PAN—Kale M. Duffey, Atria, Oregon.
- 380,431.—TRUNK HARNESS—W. H. Gabbs, S. F.
- 380,433.—HAND-PIECE FOR DENTAL ENGINES—H. S. Grace, S. F.
- 383,435.—ELECTRIC ARC LAMP—Aug. H. Harding, Oakland, Cal.
- 380,489.—ROTARY ENGINE—Jefferis & Thurman, Lincoln, Cal.
- 380,395.—ROOF-CLIMBING DEVICE—F. Kramer, Los Angeles, Cal.
- 380,453.—TRAVELING THRASHER—R. R. Moore, Modesto, Cal.
- 380,341.—STATION INDICATOR—T. W. Monroe, S. F.
- 380,342.—TRAVELING THRASHER—C. K. Myers, Stockton, Cal.
- 380,401.—VISE—E. I. Nichols, S. F.
- 380,463.—PRESERVING GRAPE MUST AND SKINS, F. Springmuhl, London, England.
- 380,612.—HAND NAIL DRIVER—J. Weichhart, S. F.
- 380,374.—EARTH SCRAPER—Wilkinson & McCourt, Acampo, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

**ROTARY ENGINE.**—A. L. Jeffers and W. C. Thurman, Lincoln, Placer Co., assignors of one-fourth to J. C. Ingram. No. 380,489. Dated April 3, 1888. This consists of an outer stationary case, an inner rotary shell or cylinder having pistons moving radially through its periphery, and a cam by which they are actuated, a stationary abutment adjustable through the outer case and fitting against the face of the inner cylinder, together with steam and exhaust passages and certain details of construction.

**TRUNK HARNESS.**—Wm. H. Gabbs, S. F. No. 380,431. Dated April 3, 1888. This invention relates to that class of devices for rapidly and effectively binding trunks, chests, boxes, etc., by means of encircling straps, and which may properly be called "trunk harness." It consists of a harness composed of two main portions, one for the top of the trunk and one for the bottom, each portion consisting of a center or centers, from which straps radiate so as to pass over the top, bottom, sides and ends of the trunk or chest, and provided with suitable fastening devices, such as buckles, rings, and straps, for the purpose of securing them all together. The object is to provide an effective "trunk harness" which may be readily applied and as readily loosened, either completely or partially, for the purpose of opening the trunk or chest.

**HAND-PIECE FOR DENTAL ENGINES.**—Henry S. Grace, S. F., assignor of one-half to Chas. W. Dicker. No. 380,433. Dated April 3, 1888. This patent covers, in a dental hand-piece, the exterior casing, the interior cylinder, within which are fitted a rotary cam shaft and spiral spring which actuates the mallet, and a spindle having the tool-holder and adjusting mechanism with an intermediate reversible connecting piece. In connection with this is a clutch mechanism by which the operative parts may be engaged or disengaged, and a means for connecting the operating parts with the flexible shaft. With this mechanism is employed a tip which may be attached or detached at will. This tip, by means of an extension at right angles with the point of the plugger, enables the operator to apply the tool so it may be operated backward or on a line parallel with the hand-piece, or at any other novel angle, thus admitting of reaching places to the teeth difficult of access.

**PLOW.**—James Porteous, Fresno. No. 380,052. Dated March 27, 1888. This is one of that class of plows in which a single beam is made to carry two plow bottoms; and the invention consists in the combination, with a single straight beam, of two plow bottoms and in the form of standards carrying said bottoms, said standards being secured directly to the beam and bent outwardly in opposite directions, whereby the requisite width between the lines of travel of the plow bottoms is obtained. The invention further consists in the novel form of the standards and in the flanges by which they are bolted to the beam. In plows of this class, where a single beam carries two plow bottoms, it is usual to bend the beam, so as to provide for the separation of the plow bottoms, and, in some cases, where a straight beam is used, blocks of wood have been bolted to the sides of the beam so as to secure the necessary separation. It is the object of this invention to secure the required width in the most simple manner and by the most effective

construction, avoiding both the bent beam and the blocks, with the straight beam, and using instead a single straight beam and bolting the standards directly to it, the separation of the plow bottoms being effected by bending outwardly the standards.

**TRAVELING THRASHER.**—Rufus R. Moore, Modesto, Stanislaus Co. No. 380,453. Dated April 3, 1888. This is a machine for thrashing and separating or cleaning grain, said machine being constructed to travel about the field, and having a receiving table and carrying belts from which the grain is delivered directly from the spout of an independently driven header which travels by its side. These receiving and carrying belts deliver the grain to the thrashing and separating mechanism, and the whole is driven directly from a central traction and bearing wheel placed beneath the machine and nearly or quite in line with the draft pole. In combination with this is a train of gearing driven directly from this shaft and means for disconnecting the thrashing cylinders and feeding belt from the gearing. A mechanism is also employed for connecting and disconnecting the wheel itself from the bearing axle, means for applying a brake to the periphery, means for adjusting and strengthening the frame of the centrally supported machine and other details of construction.

**APPARATUS FOR HEATING CARS.**—Frank J. Crouch, Oakland, Oregon. No. 380,247. Dated March 27, 1888. Pipes are placed in the upper part of the locomotive fire box and an air-pump forces air through these coils or pipes, this hot air being led in pipes through the cars of the train. A small amount of steam is also injected into this pipe to moisten the air. Large drums are placed at both ends of each car, which the hot air heats. Foot-panels are placed at the car seats, and have valves which, when touched by the foot of the passenger, allow the hot air to escape from the panels. The passengers in each seat have control of the special foot pan or warming apparatus which connects with that seat, and may turn the air into it or out at will. The train may be heated as soon as the locomotive is connected with it. There will be no danger of fire in case of accident, as there are no fires in the cars, and from the numerous pipes of distribution the atmosphere of the car may be maintained at a comfortable temperature at all times.

**SHINGLES.**—Hugh C. Henderson, S. F., assignor of one-half to N. W. Bell. No. 380,203. Dated March 27, 1888. Shingles are usually made of rectangular strips about 16 inches long, 4 to 12 inches wide, and having a thickness of about three-eighths of an inch at one end and tapering to a thin edge. The sides are intended to be parallel, but the shingles are usually wider at the thicker end than the thin end. This is a defect difficult to avoid, as the thin end cuts away more rapidly in the jointer than the thick end. When the sides taper, when laid in the usual way, the shingles are usually under or quite in contact at the lower end with a space between which gradually widens from this point upwardly toward the narrow end. Within this space dirt collects, accumulates and forms a dam which dam will sometimes be nearly up to the line of the overlapping layer of shingles which holds the water falling on the roof, causing it to set back into the space between the shingles and by capillary attraction creep up between them even above the line of the course above. The water will thus run through any cracks, nail-holes, etc., causing the roof to leak. It also causes the shingles to become damp and rot, and the nails become rusty. Even if the shingles are cut parallel, when laid there is often a receptacle for dirt and paint formed at the lower end. This invention is designed to overcome this difficulty. It consists in forming the shingles with a portion of the lower end of each edge cut away in a bevel or inclined form so as to present a diverging or widening opening at the lower end of the shingles. These new shingles when laid will have a widening space between them commencing near the lower end of the course above and opening outwardly to the exposed end of the shingles, which allows all the water that falls to run off easily.

**ELECTRIC ARC LAMPS.**—August Harding, Oakland. No. 380,435. Dated April 3, 1888. This invention relates to that class of electric lamps in which means are employed, controlled by an electro-magnet in the main circuit and an electro-magnet in a derived or shunt circuit around the arc for automatically adjusting the carbon points; and it more especially relates to an electric arc lamp patented by the same inventor Jan. 18, 1887, and in which there is employed a shaft and an electric motor tending to turn it in one direction only, said shaft being connected by suitable gearing with the carbon-holder or rod, whereby it is both raised and lowered. The invention consists in certain improvements in the means for transmitting the motion from the shaft to the carbon-holders or rods, said improvements consisting in peculiarly constructed clutches fixed upon the shaft and acting in connection with friction gears loosely joined; in swinging brackets or bangers carrying pistons forming part of the chain of gearing, and meshing with the ratchet faces of the carbon-rods, said brackets or bangers being separately and independently controlled to throw their pistons into and out of engagement by electro-magnets forming part of and peculiarly connected with the main circuit, whereby one is brought in while the other is thrown out of

circuit; in the means for dropping either rod by short-circuiting said magnets when the arc becomes abnormally long, and in other details of construction. The objects of this invention are to improve the mechanical transmitting devices by which the power of the rotating shaft is transmitted to operate the carbon-holders or rods; to provide for operating only one at a time, the others being out of gear; to provide for dropping the rod or holders when the arc becomes abnormally long by reason of the failure of the controlling mechanism to operate, and to provide simple and effective means for hanging one rod up at the moment it disengages the other.

## Mining Share Market.

The fact that the Comstock is turning out more bullion monthly than it has for years does not seem to have very much effect on the stock market. The activity in the mines is by no means followed by activity in stocks. The most important news from the mines is from the Jacket-Challenge north drift, being run on the 1000 level of Jacket to meet an incline upraise from Confidence through the Challenge south ground. The Virginia Enterprise says: The strike was made at a distance of about 200 feet in. This ore body is believed to be the northern continuation of the ore which was being worked from the 800 level of the Jacket at the south end when the big fire of April, 1869, occurred, when so many lives were lost. There has not been a pick in those diggings since. At that time the mine was paying monthly dividends of \$5, and it cost \$18 per ton for reduction and \$2.50 for hauling. The mill returns were also poorer than now. Striking the ore at that point on the 1000 level traces it with some degree of certainty from the 800 level toward the south end, the 1000 at the north end, the 1100 winze of Confidence and the 1200 of Challenge, revealing a steady inclination of ore body all the way.

The milling situation counts pretty satisfactorily for the duty of the boom. The failure of the wire-rope system of transmission at the C. & C. was the first staggering blow inflicted on the situation. But this will all be mended. The wire-rope system will be made a success and the Nevada mill will make the necessary changes in its process of amalgamation to successfully mill the ores on which it is running.

## New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco: SONOMA VALLEY LAND CO., April 7. Capital stock, \$1,000,000. Directors—A. D. Bacon, F. P. Bacon, I. C. Stamp, F. B. Hooper and Geo. H. Maxwell.

MAGALIA AND BUTTE M. CO., April 7. Location, Butte county, Cal. Capital stock, \$10,000,000. Directors—A. Abbott, N. L. Leunham, Varney W. Gaskill, A. E. Shattuck and J. F. Fassett.

KAWEAH RIVER AND GIANT FOREST R. R. CO. Object, to construct a road from a point near where the Kaweah river crosses the section line running north and south between sections 16, 17, 20, 21, 28 and 29, in township 18 south, range to Giant Forest, in Tulare county. Capital stock, \$300,000, in 5000 shares. Directors—W. S. Runyon, Jas. A. Waterman, Wm. B. Lake, Alva Udell and M. S. Eisner.

MIDLAND R. R. CO., April 10. Object, to construct and maintain a railroad from a point near the proposed terminal of the Kaweah River and Giant Forest Railway to the most favorable point of intersection with the Southern Pacific Railroad in Tulare county. Capital stock, \$180,000. Directors—W. S. Runyon, Jas. A. Waterman, Wm. B. Lake, Alva Udell and M. S. Eisner.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Savage, April 7, \$15,000; Cons. California and Virginia, 7, \$130,844; total for March, \$420,485; Mount Diablo, 5, \$5548; Alice, 5, \$24,960; Moulton, 5, \$9600; Hale and Norcross, 10, \$15,000; Standard Cons., 10, \$6172; North Belle Isle, 10, \$22,000; Hanauer, 5, \$1900; Germania, 5, \$3558; Hanauer, 6, \$1950; Germania, 6, \$1720; Hanauer, 6, \$1950; Moulton, 7, \$3552; Argus, 7, \$7819; Hanauer, 8, \$1765. During the week ending April 7, inclusive, mineral shipments out from Salt Lake City were as follows: Fifteen cars bullion, 367,726 pounds; 39 cars silver and lead ore, 1,211,545 pounds; 4 cars copper ore, 129,800 pounds; 2 cars matte, 58,200 pounds; total, 60 cars, 1,767,271 pounds.

CHINAMEN are cleaning and putting ditches in repair preparatory to their spring operations in the placers at Tuscarora, Nev.

## ASSESSMENT NOTICE.

## Butte Creek Hydraulic Mining Company.

Location of principal place of business, San Francisco, California. Location of Works, Butte county, Cal. NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 27th day of March, 1888, an assessment (No. 15) of five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary at the office of the company, No. 213 Market street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 7th day of May, 1888, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Monday, the 25th day of May, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. LOUIS R. LEVY, Secretary. OFFICE—No. 213 Market street, San Francisco, Cal.

## Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, JR.

This new and important book on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hardy-gurds, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dewey & Co., Publishers, 252 Market St., San Francisco.

## DEWEY &amp; CO.'S

Scientific Press

Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us offer to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St. S. F.

## San Francisco Cordage Factory. Mining Machinery For Sale.

Established 1856.

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice

## TUBBS &amp; CO.

611 and 613 Front St., San Francisco.

## FOR SALE.

2 Triumph Concentrators.

1 New 12-inch, 35 H. P. Engine.

VERY CHEAP. Apply

130 Sansome St., room 12.

Having completed our tunnel, we offer for sale:

1 No. 4 Burlington Air Compressor, with shaft arranged to be run by steam or water power.

1 No. 4 Duplex Clayton Air Compressor.

1 Air Tank 48 in. by 16 ft.

1 Llewellyn Water Heater, 24 in. by 8 ft.

1 No. 3 Knowles Pump.

1 Small Hooker Pump.

7 Burlington Tunnel drills.

1 Lot of Drill Extras.

1 "E" Battery for blasting.

1 Triple-Geared Hoisting Engine, built by Copeland & Bacon.

The machinery is all in good order and can be seen at our works. For prices and other information, address

BIG BEND TUNNEL & M'G CO.,

Big Bend, Butte Co., Cal.

## THE PELTON WATER WHEEL

Gives the highest efficiency of any Wheel in the world, and is everywhere recognized as the standard for high pressure service.

UPWARDS OF 100 IN USE.

From 12 to 20 per cent better results guaranteed than can be reduced from any other Wheel in the country.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Hoisting, Pumping or any other purpose where water power can be used.

## ELECTRICAL TRANSMISSION.

Power from these Wheels can be transmitted by electricity several miles with small loss, and made available for running Mills, Pumping and Hoisting Works, Trains, etc. Address

The Pelton Water Wheel Co.,  
127 FIRST ST., SAN FRANCISCO, CAL.

## HORACE D. RANLETT,

Ores, Mining, and Commission,

420 Montgomery St., S. F.

BUSINESS MANAGER OF

UNION COPPER MINE, Calaveras Co.,

NEWTON COPPER MINE, Amador Co.

Correspondent as Agent for Smelters in London, Liverpool, New York, Boston and Baltimore.

Twenty years experience, in California, purchasing Ores and dealing in Mines.

Special attention given to management and sales of mines and purchase and shipment of copper produce.

## QUARTZ MINES FOR SALE.

Under good bonds, several first-class Gold Quartz Mines, located in Amador county on the true lead; well developed and ready for mills. Samples and all particulars at office of the above.

## Atlas Iron Works

J. B. JARDINE, Proprietor,

—MANUFACTURER OF—

ENGINES, BOILERS, SHAFTING,

—AND—

ALL KINDS OF MACHINERY,

213 & 215 Mission St., bet. Main & Beale,  
SAN FRANCISCO, CAL.

Estimates given for any kind of iron work. Punching and shearing machinery a specialty.

The BUYERS' GUIDE is issued March and Sept., each year. It is an encyclopedia of useful information for all who purchase the luxuries or the necessities of life. We

can clothe you and furnish you with all the necessary and unnecessary appliances to ride, walk, dance, sleep, eat, fish, hunt, work, go to church, or stay at home, and in various sizes, styles and quantities. Just figure out what is required to do all these things COMFORTABLY, and you can make a fair estimate of the value of the BUYERS' GUIDE, which will be sent upon receipt of 10 cents to pay postage, MONTGOMERY WARD & CO. 111-114 Michigan Avenue, Chicago, Ill.

# \$1,000 CHALLENGE!

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS (\$575.00) F. O. B.

OVER 1400 ARE NOW IN USE. Concentrators are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 5, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 43 additional Frues and more stamps have been purchased.

ADAMS & CARTER.

Protected by patents May 4, 1869; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

THE FRUE ORE CONCENTRATOR OR VANNING MACHINE.

ADAMS & CARTER, Agents Frue Vanning Machine Co., Room 7, No. 109 California Street, SAN FRANCISCO, CAL.

# \$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

JOSHUA HENDY MACHINE WORKS,

## The Gates Ore Crusher.

The engraving on this page represents the Gates ore crusher, a machine which has been used for some time in the East for crushing macadam, rock, etc., and in Montana and Colorado for ore. It has not been used much on this coast, but Rankin, Brayton & Co. of the Pacific Iron Works now have the agency here. They recently shipped one for fine ore crushing to the Wenban mine, Cortez, Nev., and another is going to the Palmetto mine, Nev.

The engraving shows the construction of the machine. It is not exposed to one-fourth the strain that comes to other crushers, because the whole surface of all other crushers' faces come in contact with stone or ore, while not one-tenth of this crusher's face can strike ore at one time, being on a circle.

The top of the shaft is stationary, while the bottom is placed in the hub of the gear wheel, about half an inch out of center; this gives the shaft a gyratory motion, like holding a pencil at the top with your finger and thumb, and then moving the bottom around in a circle. There is positively no grinding motion, and so but little wear. One set of chill faces have been in constant use for two years, and are not half worn out. The continuous crushing gives this breaker the advantage over the jaw-crusher that a rotary saw has over the up-and-down saw.

The crushing head does not revolve like a bark-mill or coffee-mill (as many suppose), but while the shaft at the top is held, the shaft has a gyratory motion; but not a rotary motion, not a vibratory motion, but a continuous motion. This gives great capacity.

By being able to do finer work than an ordinary crusher, the capacity of a quartz-mill is increased. All work that can be done by a crusher is done more cheaply than in a battery, and as this crushes the ore fine, and continuously, the stamps have less to do with its product than they do with coarser ore. They have one of these crushers at the Homestake mine, Dakota, that they call the Big Jumbo, of a capacity of 100 tons an hour, and does the crushing for several mills. It is run by separate power at the mine itself, and not at the mill, which has become the practice in large operations. The crushed material is afterward distributed at the mill.

In some places in the East, very large machines of this type are made. There is one on the Burlington road, not far from Chicago, where 1000 tons of rock are crushed per day for railroad ballast. It takes a five-ton carload at a dump. These machines are also made specially for quartz work, and are arranged for either coarse or fine crushing. They have a very large wearing surface, and the size of

product can be regulated by raising the shaft. The head or concaves do not have to be changed to effect the size of material. This machine discharges freely, and there is no danger of its choking. By a peculiar safety device, there is no danger of breakage by sledges or other hard substances getting in by accident. The crusher has a very large capacity, though it requires comparatively little power.

A DISPATCH from Seattle, Washington Territory, dated April 18th, says: A rich discovery

LIQUID FUEL FOR STEAMERS.—On recommendation of Supervising-Inspector Lubbok to Inspector-General Damont, that petroleum is not safe fuel for large boilers, the Secretary of the Treasury directs that all permits for its use be withdrawn in this district, except for small steam launches. Inspector Lubbok claims that the heads of some of the stay-bolts on the side of the fire-box of the steamer Oakland were nearly hurled off, and a few hours more use would have caused a disaster. This seems strange in view of the fact that the late General

## California Slate.

We have been shown some very excellent sheets of roofing slate from the Chili Bar slate quarry, belonging to W. D. Perine and G. J. Mothersale. The quarry is on Chili Bar, south fork of the American river, El Dorado county. It is the only slate quarry really opened and being practically worked in the State. There is another in the same vicinity, but not yet opened. The Chili Bar quarry has 60 or 70 "squares" (of 100 feet each) now ready for

shipment, and more is being quarried and split. Some have already been furnished for Napa and Merced.

Very large sheets may be obtained, but those which we have at this office are 22x12 and 18x10. The blocks are blasted out and then the sheets are split with a chisel. There is plenty of slate in El Dorado county, but it is difficult to find exactly the right kind for roofing purposes. Mr. Mothersale says he has been some 12 years looking for good slate in California and this is the only quarry of fine-grained material he has been able to find. It is of good dark color and fine grain, and will do for roofing purposes, mantels and billiard-table halls. If prepared and planed, it will serve for school slates also. Our informant has been in the slate business for 30 years, and the Chili Bar slate is as good as he ever handled. He slated the Hopkins mansion, the Lane Institute, the Deaf and Dumb Asylum and other buildings.

Work on the Chili Bar quarry was started up about eight months ago, but the cost of shipment to Shingle Springs is expensive; in a week or so, freight trains will run over the new railroad, and a better market for the product will result. They will be able to furnish the slate very cheaply in the

future. However, redwood shingles are so good and so lasting that it will be difficult to introduce slate roofing except for the best class of houses.

This California slate is superior to most of the Eastern, being so fine, smooth, and good. When first quarried it is easily split. They have readily split 15 sheets out of a block three-quarters of an inch thick. It is tough, and does not easily break, nor does it crack at all when the nail-holes are punched. In fact, the sign at the quarry is made from a sheet of slate, the letters having been easily punched out without any breakage of the sheet.

THE Carlisle Gold Mining Co. of New Mexico recently paid a dividend of \$50,000 in London, equal to 25 cents per share, and making a total of \$250,000 to date.

JAMES SALOMAN, working in the St. Lawrence mine, Butte, was killed by an explosion of powder on Wednesday last.

THE GATES ORE CRUSHER.

of copper ore was made at Discovery bay yesterday. Samples are pronounced to be of an unusually fine quality, and the vein from which it was taken is eight feet thick.

MICHIGAN is credited at least with one gold mine, known as the Ropes. Its product for the year ending March 1, 1888, was \$28,940. The expenditures for the year were \$76,084, of which \$40,000 was obtained by assessments.

It is stated that a New York corporation is making all necessary arrangements for the construction of a furnace at or near Luning, Esmeralda county, Nev.

A CORPORATION was formed at Stockton Saturday to mine gypsum in Nevada and mill it there, making Stockton the company's place of business.

A PIONEER miner named John Burton committed suicide at Downieville on Wednesday, by exploding a giant powder cartridge on his breast.

Master-Mechanic Stevens and Capt. Foster were both of the opinion that the oil fuel was less trying on boilers than ordinary coal. Inspector Lubbok is to personally investigate the Julia disaster and report in full to the Supervising Inspector-Generals.

ALVAN G. CLARK, who made the great 36-inch lens in the Lick telescope, is already considering the matter of a 40-inch lens, although the scheme has not yet taken definite shape. The cost of a 40-inch lens would be about \$100,000.

MANUS McBRIDE, superintendent of the Pittsburg coal mine at Somersville (Mt. Diablo mines), was shot on Monday by one of the miners while in a dispute on pay-day. The wound is not fatal.

DURING the month of March, seven mines in the Lake Superior district, Michigan, produced 4056 tons mineral, equivalent to 6,000,000 lbs. ingot, against 6,200,000 lbs. ingot for the same month last year.

## CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

## El Dorado County Mines.

EDITORS PRESS:—In the early history of quartz mining in this county, it was the prevailing opinion that the gold was principally found near the surface of the ground, and that the gold-bearing quartz veins extended to no very considerable depth. The consequence was that all the prospecting was done near the surface, and if a "bonanza" was not immediately unearthed, the work was suspended and the ledge pronounced of no value. The theory for this conclusion was that the placer mines having been very rich in almost every mining camp in the county, the gold must have come from the surface deposits. Recent operations, however, by some of the more sanguine and energetic miners, have tended to displace this theory, and the result of such operations is proving most satisfactory to all interested in the mines of this county. During the great excitement of 1862 and '63, thousands of "pot-holes" were sunk in all parts of the county, wherever the sign of "croppings" could be found, only to be abandoned after the expenditure of a few hundred dollars and a few months' hard labor. But now the scene is changed, and after two decades

## These Old Locations

Are all being looked up, and prospecting in a scientific and systematic manner is beginning to develop numerous valuable ledges to the immense satisfaction of their owners. We shall not attempt in this brief communication to enumerate a great number of these claims, our purpose being only to show that the gold is not all upon the "outside," but that on the contrary the veins increase in richness as greater depth is attained. We had occasion to visit the Vandalia mine, on French creek, a few days since, and were much pleased with the outlook of this mine. The company have just placed in position two Frue concentrators which were doing excellent work, and we were assured by the gentlemanly superintendent that they were exactly the thing, inasmuch as the sulphurets contain much fine gold, which it was almost impossible to save by means of amalgamated plates alone. Said he: "We are now down 170 feet, and still going, and as we get deeper on the vein the richer it is, and we intend to continue to sink and develop our mine, which we are fully convinced is valuable property." They have at present only five stamps running, but will add more as occasion may require. The engine is of 40-horse power, and the mill is put up in the best possible manner, with a view to its enlargement as the work progresses.

## The Shaw Mine

On Indian creek, two miles northwest of El Dorado, is being worked with good results. This mine, famous for its rich pockets, is running its mill to its fullest capacity, and we learn that a new and much larger mill is now being placed on the mine, and will be in running order in a short time. This mine is paying well and promises to become a veritable bonanza to its owners. The Starlight, about two miles southwest of El Dorado, is one of the best developed mines in this vicinity. The company has several inclines run to a depth of 200 to 400 feet, from which drifts are run in all directions, and all showing rich milling ore. Not less than 10,000 tons of ore may be seen piled upon the dumps ready for milling. No mill has yet been erected on this mine, but we learn that it is the intention of the company to build a mill in the near future.

The Pyramid mine on Dry creek, owned by Messrs. D. C. W. and J. W. Hodgkin, will resume work about the 1st of June. This is one of the largest veins of quartz in this portion of the county, the main shaft, 140 feet deep, showing a 16-foot ledge at the bottom with excellent prospects.

The Pine Hill Gold and Silver Mining Co. (incorporated) have started a new double-compartment shaft on their mine on Pine Hill, and we are informed that they intend to sink a perpendicular shaft 200 feet deep, from which a crosscut will be made and the vein thoroughly prospected. The original shaft was sunk to a depth of 50 feet, developing a very large body of sulphurets ore rich in free gold, and also containing a good percentage of silver. Their present shaft will be thoroughly timbered in the most approved manner and will be second to none in the county. The work of sinking will be commenced on or about the 1st of May. Many other valuable properties might be enumerated, but we will mention only one, which we think must prove to a demonstration that the mines of our county are not all on the surface. We refer to

## The Springfield

Located about two miles southeast of El Dorado. This mine is, perhaps, one of the best in the county to-day, because it is the best developed, but we have no reason to doubt that the mines we have herein mentioned will prove equally as valuable when they have been equally as well developed. The genial superintendent, Mr. Poundstone, greeted me cordially on our visit to the mine a short time ago, and kindly gave us all the information we desired concerning the workings, machinery, levels, depths, etc., and upon our signifying our desire to see the "bottom" of the mine, he generously

ly granted us that privilege, and at seven o'clock P. M. we found ourselves in company of the underground foreman—a thorough miner and gentleman—descending the shaft at a gradual pace, and soon we were halted at the 1000-foot level, where we were shown through all the drifts and stopes, and made acquainted with the various ways and means of underground mining. After spending some 20 minutes or more, we were lowered to the 1200-foot level, thence to the 1400-foot, and finally, to the 1600-foot level, at each of which places we were conducted through the various drifts and stopes where we had a splendid view of the vein in its various forms and beauties. The vein has a uniform width of about four feet, and is of a bluish-white color, and maintains about the same appearance throughout its entire depth, and we do not see any reason why it may not continue an unlimited depth without any material change, except that it may continue to increase in richness. We were informed by the superintendent that it was his intention to still continue to sink, and demonstrate the fact that our mines, to be valuable, must be prospected to a greater depth than has heretofore been the custom. The Springfield is equipped with a 10-stamp mill, and all the machinery is run by hydraulic power under a pressure of nearly 400 feet. Burleigh drills are used, and the entire machinery is of the best quality, and every department of the mine shows that great care and good judgment are exercised in the management. We believe the time is now at hand when those seeking to develop our mines must and will adopt the course pursued by the management of this property, and whenever they do, the people of El Dorado county will begin to see a repetition of the glorious days of '49. A MINER.

Shingle Springs, El Dorado Co.

## "The Matting Process."

EDITORS PRESS:—In your issue of March 31st, some one, wisely obscuring his identity under "J," attacks my paper on "Matting Dry Auriferous Silver Ores" in a manner which shows that he has not thought it necessary to acquaint himself with its contents before offering criticism.

To any one who has taken a sufficient interest in the subject to carefully read the results of our experiments at Toston, it will be evident that this protesting "J" has been a trifle "previous" in his remarks, in fact that even a superficial knowledge of the subject would not come amiss to him.

In 1875 Prof. Egleston gave us a detailed account (see Transactions of the American Institute of Mining Engineers, Vol. IV) of the "Boston and Colorado Smelting Co.'s" works and operations, to which establishment "J" refers as a brilliant example of the concentration of the precious metals by means of an iron matte (sic) and there is probably hardly a Western metallurgist who has not at some time visited these works, or is not fully acquainted with the processes in use there, excepting perhaps their method of separating gold from copper.

This Colorado matting process was known to me from personal examination made some years previous to the Toston experiments. Probably if "J" had not been so much "impressed" by what appears to have been his first introduction to a modified gas-producer, he would have observed at the Central City establishment that the precious metals are concentrated in a matte carrying from 25 to 30 per cent copper. Now collecting gold and silver in a copper matte as practiced at Butte, Denver and elsewhere, is a very different matter (no pun intended) from using an iron matte—sub sulphide of iron—(?) for that purpose, as my "metallurgical brother" will discover if he ever makes a practical acquaintance with the subject.

At Toston we attempted to collect the gold and silver from silicious non-smelting ores by fusing them with iron pyrites (FeS<sub>2</sub>), and I have still to learn of this process having been put into use elsewhere in the United States previous to the publication of my paper.

The "vague rumors" referred to experiments made, I believe, in Saguache county, Colorado, by some one whose name I could not ascertain.

Toston, M. T.

W. L. AUSTIN.

## Wickes, Montana.

EDITORS PRESS:—Wickes is the location of the Helena Mining and Reduction Co.'s smelter and works, and since Governor Hauser and his party have taken hold it has been actively operated, and I believe has paid fair interest. They have been having more ore than they knew what to do with for the past year. With the production of their own mines, the Alta and Comet, and the large shipments constantly arriving from the Cœur d'Alene district, they have not been able to keep the smelter running constantly; not on account of lack of ore, but rather on repairs. It is very unfavorably located for various reasons. The most forcible of these is their shortness of room, and their water facilities are very poor, so that it is really discouraging for a company to spend any large amount of money in a place when they are hampered for room as they are now. The Minah mine, owned by Messrs. Briscoe & Sites, is making regular shipments of ore, and has been

continuously for nearly two years. Their ore yields handsome returns. The amount of the product for 1887 I did not learn, but the shipments during seven months of 1886 aggregated over a quarter of a million.

The Montana Central roadbed is now graded much closer to their mine than the Northern Pacific, and when the large tunnel, one mile above Wickes, is completed, the main line will run less than half a mile from the Minah mine, and thus will enhance their facilities for handling ore. R. G. H.

## The Newton Copper Mine.

EDITORS PRESS:—The Newton copper mine property is located four miles east of Ione, on the stage road to Jackson, Amador county, at an elevation of about 800 feet. The situation is all that could be desired both for convenience in working and beauty of location. While the earth is made to give up its treasure of copper from the rocks below, the surface of the mine yields its crop of fruit, grain and vegetables. As the surface takes in a ranch of 100 acres, the owners can be both ranchers and miners. By reason of its location the mine can be worked 365 days in the year. The mildness of the climate is proven by the fact that the mine ranch furnished the table with green peas at Christmas. While this does not excite comment on the part of a Californian, yet to the general mine operator it is a marked contrast to the usual condition of the climate in mining localities.

The Newton mine was discovered in 1860 by Mr. J. Newton, by whom it was operated in a small but successful way until 1867, when the mine came into the control of Glidden & Williams and Oakes and Oliver Ames of Boston, and was operated by C. T. Meader until 1868; then Mr. H. D. Ranlett took charge of the mine and operated it until 1876. The mine then passed into other hands until 1887, when the present owners, Mr. H. D. Ranlett and J. A. Ferson, became the possessors. From 1876 to 1887 the working of the ores was in the hands of a theorist. Under his management an extensive and expensive plant was erected in 1876, which proved one of the most marked successes as a failure ever recorded in California copper mining. The receipts of the nine years under this system showed from 1877 to 1885: Expense account, \$102,140 65; receipts \$50,906 45; theoretical gain of \$51,234 20, in Irish dividends.

The ore during this time carried an average of eight per cent in copper, of which about one per cent was extracted. The failure was due to the success of "Frierberger's" zeal as displayed in brickyards, elevators, roasting stalls, revolving barrels and every known or unknown contrivance for frequent handling and consequent expense in the treatment of the ore. By reason of faulty roasting, the ores were mostly converted into an oxide instead of a sulphate of copper, and were therefore not soluble for leaching purposes; hence the failure. From '85 to '87 the property was in the hands of a custodian. When Messrs. Ranlett & Ferson became owners, operations were conducted in the most simple and practical manner possible. Under their management the old works have been in part torn down and the balance allowed to remain for the present as a monument to theory.

At present the ore is run out of the mine in a car which dumps upon a pile of wood. When the pile has attained sufficient size the pit is covered over with earth and the wood underneath set on fire; a few holes on the top of the pit furnish sufficient draft. Once fired the ores continue to roast for eight months, when a spray of water is turned on to the pit, the leached solution flowing into sluice-boxes filled with scrap iron, where the sulphate of copper attacks the iron, destroys it and forms a precipitate of copper cement, which is then dried and sacked for shipment. For simplicity and inexpensiveness nothing more could be desired, two men by this method converting the soluble copper of 30 roasted tons into one of copper cement as against 10 men by the former processes with the attending expenses of foreman, engineers, firemen, and the enormous expense of constructing and maintaining an extensive plant.

That there is no evil unattended by good is exemplified here by the handsome returns and steady output realized by the present owners from releasing the old leach-pile of improperly roasted ore which day after day continues to give up its treasure of copper. The old dump of waste rock proves itself also a contributor of no mean proportion. By reason of the ores readily decomposing by the action of the elements alone and mechanically forming the sulphate of copper which is washed and leached out as are the roasted ores, I doubt if there is another copper property where nature alone will do the work, and that so effectually. In the readiness with which these mines' ores can be treated lies the great secret of their successful and profitable working, as the ore is naturally a leaching ore. No better exhibition of "something from nothing" was ever given, and that something a handsome return on the investment year after year from ore discarded by the former managers.

The mine is operated by one working shaft 400 feet in depth, from which four levels have been run 300 to 400 feet in length. The vein is four to eight feet in width. On the north side the ore of the first 100 feet remains untouched

and forms a handsome reserve. The chute expands from 200 feet on the surface to 400 feet on the 400-foot level, and grows richer in copper as depth is attained. The roasting ores carry an average of seven per cent in copper, while the shipping or smelting ores give 14 per cent on the average; frequent bodies yielding 20 per cent. The strike of the vein is northwest by southeast. There is scarcely any dip, the vein being almost vertical. The mine has been pronounced a true fissure by the well-known experts Mr. Howe, M. E., and Mr. Reese of Falkenau & Reese of San Francisco. For the present Messrs. Ranlett & Ferson will mine the ore from the reserves above the 100-foot level and work the ores in the old dump and leach-pile. They have a force of men at work taking out the ores from the old waste dump and placing the same in piles for roasting. They expect by midsummer to have on fire 4000 or 5000 tons of ore. Later on they will sink the main shaft an additional 100 to 200 feet and extract the smelting and shipping ores known to exist at that depth. Should the body of ore prove as extensive as everything now indicates, large smelting works will be erected for the treatment of all the ores on the mine.

The present owners have no desire to dispose of more than a minority interest. Should they do so, it would be with the object of securing sufficient working capital to put the mine at once in condition to work it to the fullest capacity. The old roasted dump-pile alone will yield 50 tons of copper without extracting one pound of ore from the mine. In view of location, character of ore, simplicity and inexpensiveness of treatment, nearness to railroad and the present boom in copper, Messrs. Ranlett & Ferson have every reason to shake hands with each other over their fortunate and now profitable investment. E. H. SCHAEFFLE.

## Ten-Mile District.

EDITORS PRESS:—This district lies 22 miles southwest of Helena, M. T., and is now connected by railroad with Helena by a branch of the N. P. R. R. One of the most prominent properties in this camp is the Peerless-Jennie, a silver and lead property. It is operated by an incorporated company and is superintended by Mr. Vaughan. The mine is shipping ore regularly, I believe, to the Holden smelter at Denver with satisfactory results. A force of miners is regularly at work taking out ore.

The Lee Mountain mine, also a silver and lead property, owned by Messrs. Caplier, Murphy and others, has been thoroughly tested, and when they can have their ore reduced at living rates will have no difficulty in realizing fair returns from their mine. The Red Mountain properties, lying adjacent to the town, are owned for the most part by the Montana Central railroad and will be inactive until they iron their branch. This it is expected they will do as soon as their reduction works at Great Falls are completed. Until this is done the town of Rimini will undoubtedly be dull, as there are not enough men employed to make it a lively camp. Quite a town was built here on expectations some two years ago; two fair-sized hotels and four or five stores were built and the usual number of other establishments. One trip daily is made on the road now and then, and a considerable amount of cordwood is shipped to Helena from along this road, thus creating a fair traffic for the railroad in connection with the supplies and ore shipments from the Peerless-Jennie. H.

## On Milling Ores.

The different methods of milling gold and silver ores come up occasionally for discussion, and indications of progress are always welcome. As the only object of milling these ores is the extraction of the precious metals imbedded in them, all devices for this purpose should aim at speedy reduction, economy of operation and a minimum loss of the precious metals. Strictly speaking, there are only four radically different methods by which this work can be done, namely, by rubbing the quartz to sand, as in the arrastra; by pounding it to sand, as in the stamp-mill; by crushing it, as in the rock-breakers and Cornish rollers, and by granulation, as in the rotary granulator. Some devices combine, in a measure, two or more of these processes. It is pertinent to inquire which of these methods, in the nature of things, must be the best. Manifestly that one, other things being equal, which is least destructive of the precious metals. As native gold is a soft metal and the quartz in which it lies imbedded is extremely hard, it necessarily follows that all rubbing, pounding and bruising of the soft, yielding gold against the hard, sharp quartz, must be rapidly destructive of the gold, the very thing to be avoided.

## The Stamp-Mill Method.

The loss of gold by attrition in the stamp-mill has for years received serious consideration, and a few pertinent facts will afford an intelligent understanding of this method. In gold-bearing quartz, yielding \$20 to the ton, for example, there will be an average of one cent's worth of gold in each pound of the rock, since there are 2000 pounds in a ton and 2000 cents in \$20, and in \$10 ore the average is, of course,

one-half as much gold in a pound of rock, or two pounds of rock to one cent's worth of gold. One cent's worth of gold is nearly the size of an ordinary pin-head, and the number of grains of sand of the size of a pin-head in a pound of ore is definitely determined by simple computation, and it is known to be a little over 98,000. In other words, there are nearly 100,000 grains of hard, sharp quartz to one of soft, yielding gold in one pound of rock worth \$20 a ton, and in \$10 rock nearly 200,000 grains of sand to one of gold.

#### Amount of Attrition.

The next step is to determine the amount of attrition, or how many times this pin-head of gold in \$10 rock is bruised, pounded, rubbed and ground with this mass of nearly 200,000 grains of sand before the whole is liberated. This problem is simple and easily solved. One stamp, weighing 750 pounds, and credited with crushing two tons in 24 hours, dropping 90 times, or striking the quartz 90 blows in a minute, in one hour will strike 5400 blows to crush one-twelfth of a ton, and in 12 hours will deliver 64,800 blows to reduce one ton. If the ore yields \$10 per ton, or 1000 cents, clearly it takes a fraction over 64 drops or blows of the stamp to liberate one cent's worth of gold, and it has been hammered, bruised, rubbed and ground 64 times against the sharp, hard quartz before it could make its escape. It is not surprising that about 20 per cent or one fifth of the gold is thus lost by attrition, and it is reasonable to suppose that this lost gold will be found as "elimes" in the water, and hence that the water from the battery will show it by assay. After all, then, it takes pretty good rock to yield \$10 a ton in this wasteful, wicked and wonderful stamp-mill.

#### The Granulator.

For convenience of illustration and simplicity of reasoning, the numerous devices, combining the rubbing and pounding processes, will be passed by, as they are alike guilty of attrition, and attention will be directed to the simple granulator as presenting a strictly diverse method from that of the orthodox stamp-mill. As comparatively few are familiar with the granulator and its mode of operation, a little information is desirable. The granulator consists of two vertical disks of iron, one being 18 inches in diameter with a concave face like a deep iron dish, and the other, 14 inches in diameter, with a convex face, somewhat like the bottom of a soup-dish, the peripheries being placed together on the lower right-hand side of the face of the larger disk, thus forming an opening on the upper side between the disks to receive the quartz the size of English walnuts, or even hen's eggs, the rock having previously passed through the rock-breaker. The disks are adjusted to do coarse or fine work by a set-screw, resting on a stiff steel spring, and a simple device provides for the passage of pick points or gads without injury to the mill. The faces of the disks, against which the quartz is broken, the only parts that wear, are made in the form of plates and bolted fast to the solid head or body of the disk, and these plates are readily removed and renewed. In a complete mill there are three sets of disks, arranged one in front and below the other as steps of stairs, so that the rock may pass for gradual reduction from one to the other by gravitation on a vibrating wire screen. The mill is run by belts and is a self feeder.

#### The Granulator Method.

The disks revolve together and in the same direction, the larger one going at the rate of 600 revolutions per minute, and the smaller one 700, thus producing a twisting and crumbling motion and pressure on the ore the moment it comes in contact with the faces of the rapidly whirling disks. The rock passes instantly through, crumbled and crushed into small fragments (one quarter of its fine enough), and the whole of it falls immediately upon a shaking wire screen, the fine going through the screen and on its way to the concentrator, while the coarser portion passes directly into the second set of disks, where it is again twisted, crumbled and granulated as before, only much finer, the disks being set closer together, one-half of it being now fine enough, and all falling again upon the screen, only the coarser part, usually about one-fourth of the original mass, is left for final treatment by the third set of disks, where it is granulated to sand, and in most ores it is little else than pure quartz sand, the precious metals and sulphurets having been already almost entirely eliminated.

#### Without Attrition.

A simple statement of the operation of the granulator reveals the patent fact that it is a method of reducing gold and silver ores without attrition of the precious metals, for the reason that, by this method, the ore breaks or yields at the point of least resistance, or where it is weakest, as where there is a seam or cavity containing gold or sulphurets, and in passing through the first set of disks, which reduces the ore to the size of coffee grains, nearly all the free gold and sulphurets are set free from the gangue and go through the screen without a bruise or mark on the gold, while the sulphurets may be broken between the thumb and fingers as they come from the concentrator. When ore is reduced to the size of coffee grains, in this manner, any practical miner knows that the small, solid pieces left contain comparatively little free gold and almost no sulphurets. On going through the second set of disks, the ore is reduced to the size of rice grains, and is found in the bands of the assayer little else

than pure silica. In a true granulator, there is, in fact, no grinding of the ore whatever, it being simply crumbled into sand.

There remain yet for consideration the questions, which method is the most expeditious? and which is the most economical? A full answer to these questions would exceed the limits of the present review, and is deferred to some other time. It is sufficient for the present to state that the granulator machinery weighs but one-tenth that of a stamp-mill of like capacity, is sold for one-eighth the cost of stamp-mills, and takes but half the power; a ten-ton mill costs but \$500, weighs but 1000 pounds, the heaviest piece 240 pounds, the plates or wearing parts only 80 pounds, costing five cents per pound, and will be renewed by the agent at ten cents a ton for every ton of quartz reduced by this method.

#### Granulated Ore Concentrators.

Concentrating granulated ores, that is, successfully handling both coarse and fine pulp at the same time by one machine, has been a hard problem in the milling of ores, but it has been finally solved by a perfect concentrator, made entirely of iron and steel, except a few small brass parts, the heaviest piece weighing but 102 pounds, the whole but 1000 pounds, and it should last a lifetime, as the only wearing parts are the scrapers, which are occasionally renewed at trifling cost. The basis of this concentrator is a vibrating iron table, 32 by 78 inches, inclined from head to foot, with the surface subdivided from end to end by thin iron ribs an inch high into narrow lanes four inches wide. These lanes have a series of depressions or basins in them 18 inches long and 1½ inches deep in the lowest place, with a rille at the lower end. The table is operated by a cam, the throw or motion being toward the upper end or head of the table. The force of the throw drives the pulp or granulated ore toward the head of the table, gravitation settling the heavier parts into the sand in the basins, and would send it all over but for the action of the water which is evenly distributed with the pulp at the upper end of each one of these narrow lanes, and flowing down, filling the basins in its progress, it passes away with the gangue over the foot of the table. It thus appears that we have three contending forces at work—the throw of the table, attraction of gravitation and the flow of the water, the force of the throw driving all the heavier parts of the pulp, such as sulphurets and free gold or silver, toward the head of the table, gravitation sinking them into the sand, each stroke or throw sending them forward and downward beneath the rolling sand which the flowing water is moving slowly on toward the foot of the table. The separation, which we see thus going on, is rendered complete by the action of the automatic scrapers which plunge down into the pulp at the lower end of the basins and travel along on the bottom of them beneath the mass of pulp, gathering the sulphurets and gold settled there, and, rising out at the upper end, they carry a portion of the sulphurets and gold over the rille of the basins above, where it is deposited, when the scrapers ride back again above the moving pulp and flowing water to the lower end of the basins and once more dive down to the bottom as before and move forward with their next load of sulphurets and gold. But the scrapers perform another essential service in keeping the pulp in a soft, loose condition by this constant plowing through it, so that the sulphurets and free gold will always sink into the soft bed to the bottom of the basins where they are caught by the scrapers and moved forward, the force of the throw finally carrying them over the head of the concentrator into a vat which stands ready to receive them. Amalgamation is the next step, and is a simple and easy operation. [The above article is from the *Resources of California*. The machines referred to are the Stiles granulator and concentrator.—EDS. PRESS.]

**SILVER LEAD ORES.**—Representative Woodhurn of Nevada says that one of the most important objections to the Mills tariff bill seems to have been overlooked, even by the opponents of that measure. It is proposed to reduce the duty on lead from \$20 to \$10 per ton. Woodhurn says if this reduction should go into effect it would mean the shutting down of scores of silver mines in Nevada, Colorado and Montana, Idaho, Arizona and Washington Territories. The value of lead in low-grade silver ores now pays, under a protective tariff, the cost of mining.

**MARIE A. VALENTINE** has filed a bill in equity in the United States Circuit Court, against Samuel D. Valentine, Thomas B. Valentine, George Horn, William Werry, Joseph Werry and Philip Nichols, to restrain them from working the Big Oak Tree mine in Placer county. The complainant alleges that she has brought a suit in ejectment against the respondents to determine the title and possession of the property, and prays that they be restrained from working the mine until the action has been decided.

**WAR BALLOONS FOR RUSSIA.**—The Russian Government has ordered a number of air balloons to be made in London, to serve in case of war. Each balloon is provided with a car in which six men can be placed. The balloons will be made of incombustible materials, and so disposed that they can be filled by means of hot air.

## The Mines and Miners.

BY PEDRO CASTERA.

(Continued from our last.)

[Translated for the Press from *El Minero Mexicano* by M. N. M.]

### The Immured Miners.

The darkness of the works was relieved only by a reddish light, which was struggling in an atmosphere charged with nauseating vapors of sweat, of blood, of pitch, of smoke and powder. The air was rent with cries of pain, of horrid imprecations, of blasphemies, of *ayes*, of complaints, but above all was heard the energetic and powerful voice of the mandon de barras, who exclaimed whenever a man fell wounded: *Adelante! Adelante!* (forward) *sin novedad!* (no danger.) I cannot describe the scene, but I know that it was horrible and at the same time magnificent. When I arrived and they heard the whistles and cries of command, they received me with a salute of applause, of hurrahs and of savage howlings. The work went on. "We want air!" cried several. "Some of you to the ventilators," I ordered. We were on the planes (lowest workings) of the mine, and notwithstanding the great velocity with which they worked the two fans, we were hardly able to breathe. "The water increases," screamed others. "Man the pumps," I said, and soon the water was diminished. In this incessant struggle, six hours without repose, they had extracted four dead bodies. The foreman said to me: "It is impossible to continue; there are already ten or twelve wounded, and"—I did not let him conclude. It was a critical moment, and if the men became demoralized all was lost. "Continue your work! Go on!" "Very well," he replied, "but we need timber to prevent the caving of the hill." "Let it be brought!" "It is all in use." "Use your men!" "¡Jesu Cristo! Men for props?" "For props! Yes, señor, but in action; *Adelante!*" The men, encouraged by these words, with shouts advanced to again contend with the rocks and stones that were crushing their brothers. Four hours later eleven of the unfortunates who were buried alive had been saved, and, weeping, were embracing the knees of the harreteros. The voices of the other five could be heard through the wall of stone that separated us from them, mournfully soliciting the services of a priest. This I can never forget. New efforts, new struggles, but without avail. The doomed men would die of hunger if not of asphyxia. One day and night more we labored, but it was all in vain.

### Un Padre!—Un Padre!

They murmured with feeble voices. The priest of the Real was sent for. He descended on the shoulders of a miner. Those following were exclaiming: *Un padre!—Un padre!* The priest, raising his voice, said: *Retire, my sons; you have done all that is possible; let religion do the rest.* That accent, mild, tender, modest, but at bottom energetic, dominated the situation. The placemen kept their arms, and the harreteros, who a few moments before appeared demons, began to file out sadly silent, occupying the next works. The priest and I remained alone in the gallery opposite an enormous heap of blood-stained rubbish that some torches were illuminating with a fantastic and flickering light. Standing there, grave, tranquil, erect, with authority, he fixed on me a serene look that was an interrogation. His beautiful brow was crowned with gray hair.

I drew near him and said in a low tone, "Padre, I do not think that I have fulfilled my duty. Destiny can be controlled, if one does not give way to it." "That is true; but here the death of these unfortunates does not designate a lack of foresight or exhaustive effort, it denotes the act of God," and the forefinger of the right hand of the priest was pointed upward. "No, not by Him—I have been vanquished by this wall of rock," I murmured. The priest laid his hand upon my head, which was burning.

### "Vanquished—Yes, and Pardoned;

Vanquished by Him who can defeat all; pardoned in His name by me. I forbid now any further labor." I withdrew then to the other works in which the harreteros knelt praying and prayed with them. The confessions of the imprisoned men were heard through the wall of stone. When they were concluded, the priest blessed and absolved them, and all the harreteros began their mournful alabado. The bells were tolling slowly, but by reason of the distance, we could hardly hear them. The harreteros would have suffered death rather than begin work again, after having been prohibited by the priest. I spoke to them, exhorting them, and even menacing them, but all was useless. The priest led me near the wall. "Señor amo," cried the unhappy men, "we have children." I could not speak. I did not shed a tear, but something furious and very black was in my soul. That honorable old man, that holy pastor of souls, whose name he forbade me to reveal, spoke to them, and promised to take under his protection their children. He complied with his promise, and to-day they occupy a place among the useful and laborious artisans of Mexico.

The words and groans of these victims of the unforeseen were depressing, and became more and more inarticulate. Some hours passed. The five men had perished. The priest drew me out of the mine almost by force about an hour before the sun rose. The sky was blue—

intensely blue and serene. Light cirrus imitated white swans wandering in the immensity. "The fountain of light" was sending forth torrents of fluid gold, which, breaking over the green and diamond-angled leaves, appeared like a rain of liquid rubies. Some hours later the intoxicated harreteros and their women were dancing beneath the burning rays of the mid-day sun.

The foregoing account I had from one of those heroes who lives in our memory by this simple episode.

### El Tildio.

The Real in which the event that I am going to relate took place is on a slope of the Sierra Madre, which passes through the State of —. At that point, the hills, which are the beginning of the Sierras, form a semi-circle that resembles an immense amphitheater constructed by giants. Between their two segments, the plains, covered with pasture, extend, until they are lost in the horizon, and in the evening look like a sea of sparkling fire, under the purple light of the sun. In the declivities, dales, angles, and little mesetas of the hills, mines are scattered in beautiful disorder, and on the plain are various haciendas (buildings, offices, smelteries, etc.).

One morning in the month of February, 1873, all the visible landscape was covered with snow, which had fallen during the night. Our country presents a great variety of climate. In the Real of the Espiritu Santo, of the State of Michoacan, the temperature rises to 35° Reanmur, and on the 14th, in the vicinity of Potosi, it fell to 7° and 8° below zero, with snow in abundance. The cold was intense, and the plains carpeted with snow were dazzling to the sight. Spirals of smoke from the smelters ascended, describing fantastic forms above the white of the llanura. Afar off the

### Plines of the Sierra.

Likewise draped with snow and standing out against the pale blue of the sky, seemed like immovable sentinels contemplating the vastness by which they were surrounded. The tiled roofs of the tiros, the divers offices and the great number of cottages of the miners were glistening in the whiteness, and little threads of water produced by the thaw, were running in all directions, distributing the light in a harmonious array of colors. It might be said that the clouds had cast upon the earth a shower of diamonds. The sun was shaking its golden head in space, slowly ascending and contemplating the landscape with an infinite look of love.

The women of the laborers, who were carrying to the latter their breakfast, were moving gracefully over the white ground of the snow, in their red, blue and yellow skirts; and the groups of harreteros crossing the hills, the mules descending the paths loaded with metal for the furnaces, the madereros dragging great beams and morillos, the carboneros carrying the alma for the forges, and the boys throwing snowballs, formed the life of that picture designed by nature with the essence of coloring and by the great Artist with the simple appearance of the sun.

The joyful sound of the chiro-bell calling to mass, the cries of the muleteers, the hammer strokes upon the anvils, the dull and distant detonations of the harrenos and the festive songs of those at work in a morning so luminous, placid and smiling, communicated to the spirit an unconscious faith, a sweet tranquillity and an infinite confidence in nature, clothed as it was in innocence, in whiteness and in light. The exquisite transparency of the atmosphere, the stir of the multiform life, the developing motion caused by the rising heat—all these splendors of the divine model, presented a landscape worthy to be copied by Vicenzo della Bruna or described in the artistic style of Gauthier.

(To be Continued.)

**SECOND GROWTH FORESTS.**—Among the problems which have remained unsolved to the present day is the growth of a second forest upon the site once occupied by a forest which usually differed in character from the later growth. It has been supposed that the seeds from which the second forest sprang had been lying undeveloped in the ground for a great length of time, perhaps centuries, but the improbability of their retaining their vitality for such a length of time, and under the conditions to which they must have been exposed, makes the theory rather implausible, and besides, the origin of the seeds is not accounted for. A practical woodsman of Indiana supposes that the seeds from which the second forest arises are carried in great numbers and from long distances by birds and the small animals which are found in the forests, and supports his view by relating observations of incidents in which it was actually carried out on a small scale.

THERE has been found in the mountains east of this city, says the *Tulare Times*, an extensive bed of chlorapatite, a mineral composed mainly of phosphate of lime. A piece of this mineral has been assayed and yielded 52 per cent of phosphoric acid. It may not prove profitable to extract this phosphoric acid, but the mineral itself is one of the best fertilizers known, and no doubt would prove valuable in reclaiming our alkali lands. No mineral substance possesses more influence over the growth of edible plants, such as wheat, oats, barley, turnips, etc., than phosphoric acid does, hence this discovery may in time prove a great boon to our farmers.

## TABLE OF CONTENTS.

EDITORIALS.—California Slate; The Gates Ore Crusher, 245. Passing Events; Reflections on the Mining Stock Market; Better Go Slow on Copper, 248. Cases for Entomological Specimens; Thawing Out Giant Powder, 249.

ILLUSTRATIONS.—The Gates Ore Crusher, 245. Sectional View of Box for Thawing Out Giant Powder; Plan View of Interior of Box for Thawing Powder, 249.

CORRESPONDENCE.—El Dorado County Mines; The Matting Process; Wilkes, Montana; The Newton Copper Mine; Ten-Mile District, 246.

MISCELLANEOUS.—On Milling Ores, 246. The Mines and Miners, 247.

MECHANICAL PROGRESS.—Important Investigation in regard to Manganese Steel; America's Iron and Steel Progress of Serious Import to England; Casting Great Guns; Wire Drawing; Remarkable Marine Engines 250.

SCIENTIFIC PROGRESS.—Ancient Microscopes; Improvement of Land by Nitrate; What a Blizzard Is; The Multitude of the Stars; Electric Resistance of Cobalt; Black Gold, 250.

GOOD HEALTH.—The Human Stomach; Too Much Hugging and Kissing of Children; Danger in Falling Trees, 251.

USEFUL INFORMATION.—Artesian Wells Long Known in China; How to Care for Silverware; A Marine Novelty; Magnetic Properties of Iron; To Detect Alloys in Gilding; Substitute for Gum Arabic; New Magnesium Lamp; Long Distance Telephone in France; The Heaviest Block of Marble; Casting Steel Wheels; Protection of Boiler Tubes; Pencil for Writing on Glass, Etc., 251.

ENGINEERING NOTES.—Another Great Bridge Proposed; Improving the Ohio River; Canal Construction in Canada, 251.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 252-3. MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 256.

## Passing Events.

A mill is now at work on the tin ores of the Southern Black Hills, Dakota, and has recently shipped a lot of concentrates to be smelted. At present they can turn out two tons of concentrates per day, but expect to produce 100 tons a day. This looks like business at last, and no doubt if this venture is successful, other mines will be properly worked. We have never before had any American tin put in marketable shape, although small blocks have been made from California and Dakota mines.

The discovery of gold in Lower California still continues to cause some excitement in the southern part of the State, and a number of people have gone to the "find." It will be well, however, to take the stories with a "grain of salt." The country is a very dry one at best, and few people ever made any money gold-mining thereabouts.

The prospects for quartz-mining in California were never better than this season. Nearly all our well known mines are doing well and many new ones have been opened and are being developed. In the working of gold ores much has been learned in the past few years, and we can now mine and treat ores cheaper than ever before.

A railroad is to be built into the great copper camp of Bisbee, Arizona, to save cost of transportation in coke, crude hullion, etc.

Four Chinese hydraulicers were arrested on Monday, near Omega, Nevada county, and taken to jail at Marysville.

## Reflections on the Mining-Stock Market.

The downward course of mining stocks in view of the condition of the Comstock and other mines represented on the board is certainly very paradoxical. It is admitted that the leading mine on the Comstock are now in the most prosperous condition that they have been in for ten years. The California and Virginia has paid 16 dividends from the last discovery of ore, and all reports indicate that these dividends will be earned for an indefinite period. The Hale and Norcross promises dividends next month, and Potosi is prospering, as well as several other mines, which are practically off the assessment list. The outside mines, also, are in better condition than ever, North Belle Isle having disbursed in the past five months \$250,000 in dividends, with assurances of indefinite continuance. In fact, it would seem that dividends are sure, unless the managers act dishonestly, for speculative purposes.

Notwithstanding such situation, stocks continue to decline, and those surest of dividends, and those actually paying dividends, decline the most. Since December, every dividend paid by the California and Virginia has sent the stock down more than twice the amount of the dividend. What is the reason? Some say that the Committee of Reform appointed by the regular Stock Exchange to investigate the management of the mines has so disgruntled the inside managers that they have withdrawn their support of the market. There is little reason in this assertion. Any well-intended conference of stockholders in the minority with their managers, to ascertain whether the mines are managed economically and honestly, should meet cordial reception. All other corporations expect investigation, and are frank and open in their reports to stockholders. Mining corporations should be equally frank with their stockholders. While it must be confessed that mine managers do not seem to record stockholders' reports as do commercial corporations, there are other reasons for the vagaries of the stock market.

There can be little doubt that inside holders bear good dividend stocks to buy them in cheap, while doubtful or assessment stocks they sell because they wish to make the public carry them, and at a price that will not justify forfeiture for non-payment of assessments. This would seem to be the role that has been played for some time. Another disturbing element in the market is the conduct of unprincipled brokers. A customer gives an order for stocks and pays in his money on a margin. If the broker believes the market will decline he buys no stock and chances accounting for it on a lower market without a transaction on the Board. Or if he has purchased the stock, and he sees the market declining, while the customer holds back from selling, the broker sells the stock on his own account, helping on the downward tendency, and when called by the customer accounts for the stock at the ruling price without a sale. In this way he speculates on his customer's money, and at the same time helps to thwart his hopes of an advance. The November flurry brought out such practice.

The natural course of stocks, by reason of promising or unpromising developments, which the public would always be glad to gamble over, is so thwarted by such tricky manipulation that it is a wonder that anybody buys them. Whichever way an investment is made, insiders and brokers contrive to defeat the purpose of the investor. The course of the market is driven without regard to the reports from the mines. As far as affecting the market, all reports might as well be unpublished. Stop a dividend and the stock may bound up rather than drop down, as did California and Virginia, when it passed one dividend. Levy an assessment and the chances are that the stock will advance. In short, actual prosperity of the mine brings adversity to the stock-owner, and real adversity brings him prosperity.

In the former case the mine needs no help, and the stock may go to the insiders as cheaply as possible. In the latter case the mine cries for work, and the insiders make the public carry all the stock, if possible, and pay all the assessments till election time comes round and it becomes necessary to keep the management.

It behooves the insiders and brokers to consider well their ways, or they may "kill their goose."

## Better Go Slow on Copper.

The present is a good time for owners of copper-bearing deposits or of shares in copper-producing mines to dispose of the same, which implies, of course, that the present is a good time to refrain from investing in properties of this kind. Yet, trusting to a continuance of the high prices now ruling for that metal, there will be those who will make the mistake of purchasing these properties as there will also be those who will for the same reason make the mistake of refusing to sell them; these two classes of people, both the outs and the ins, disregarding the advice of the astute broker who counseled his clients to "buy 'em when they are low and sell 'em when they are high." That the price of copper will be kept up for several months is probable; but that the present abnormal rates can become permanent or even hold for any great length of time is out of the question. The foreign syndicate that now controls the market selected a good time for inaugurating their scheme. Toward the close of last year, when they had perfected their plans and were ready to commence operations, the price of copper was low and stocks in first hands much reduced. They were, therefore, able to negotiate the purchase of large lots of this metal on favorable terms, having at the same time a much depleted market to supply.

At the outset of their career other fortuitous circumstances and events contributed to work in their favor. The fire in the Calumet and Hecla mine, started a little while before, proved much more serious than was at first supposed, materially reducing production from that prolific source. Winter being at hand, no increment of plant could be made in the Michigan, Montana or other Northern mines, where more than half the world's output of copper is made. Even in California, Arizona and other Southern countries no largely increased production could at once be brought about. It required time to rehabilitate the mines and reduction works that through long disuse had fallen into a state of decadence, as many of the formerly producing properties in these countries had done, there having been in Arizona experienced the further difficulty of obtaining suitable fuel for smelting purposes on short notice.

From the start, and up to this time, everything has seemed to favor the aims of the great French syndicate. Until recently it has been found impossible to increase the output of copper to any great extent, and thus the monopoly has been able to maintain prices at nearly the highest figure reached since the advance began. But the question is, how much longer can this be done? In the attempt to answer this question we have first to consider the extent to which consumption will be reduced by reason of the high prices demanded for this metal, and which reduction an English authority put at one-third the quantity formerly consumed. Supposing this to be a fair estimate, we have here a potent factor working toward lower prices. That the output of copper, through the impetus lately given that industry, will very soon be increased in a like ratio there is reason to believe. The agencies tending to bring about a reduction of prices will be equal, therefore, to 66 per cent as compared with the former status of the trade.

In California the output of copper this year will be more than double the annual product made for many years past, while the rate of increase in Arizona and Montana will not be so large; it will hardly fall below 50 or 60 per cent on the yield of last year. Being universal in their effects these high prices will, in like manner, stimulate the industry throughout all the other copper-producing regions of the world. It has, in fact, done so already. What the result must be it is easy to foresee. That the price of this metal must in the early future undergo a marked decline seems inevitable.

Meantime, it will transpire that the more sagacious holders of shares in the big copper companies will have unloaded their holdings on the general public. Scores of worthless claims purporting to be mines will be put off on those confiding in a continuance of high prices and others anxious to profit by the copper boom, all hoping that, if not very lasting, it will last at least long enough to enable them to make a turn and get out before the crash ensues.

As years ago during the silver craze growing out of the Comstock discovery, so is there now danger that a like unhealthy excitement

will be bred of this copper furor, which, although it cannot prove so widely disastrous, will, if suffered to fully mature, result in a deal of mischief. The consequences likely to attend any unchecked development of the copper boom would perhaps find more apt illustration in the case of quicksilver, which, ten years ago, when the price of that metal had reached its acme, led to such activity in that branch of mining as soon caused the price of quicksilver to tumble below the point of profitable production, its sudden depreciation bringing heavy loss to those who had too hastily embarked in the business of mining for this metal.

As regards the proper policy to be observed in the case of copper, it seems to us that parties having pay bodies of ore already developed or deposits known to be rich, should at once proceed to work them to their fullest extent, making in the meantime as few costly improvements of a permanent kind as possible. Where the ore is rich enough to warrant shipment, the mine being without other than boasting plant, it would probably be best, in most cases, for the owner to sell to the smelters or to purchasers in the general market, and thus avoid the expense and delay incident to the equipment of their properties with reduction works. The idea we wish to inculcate being haste to avail of the present high prices and an avoidance of unnecessary expenditure in doing so. Experience teaches that such in all cases of this kind is the wisest course to pursue.

That an immediate decline in the price of copper will ensue or that the decline when it commences will be rapid is not very likely, there being little probability that this metal will soon touch as low figures as have obtained within the past two years. And yet the very reverse of all this may happen. It may turn out, as in the case of quicksilver, that such an over-production will come of the prevailing high prices as will precipitate them below the lowest point yet recorded. In the use of quicksilver there was nothing else that could be employed in its stead. Manufacturers having found substitutes for copper, it may happen that this metal will in some instances be permanently displaced, and thus its use come to be considerably curtailed.

When copper shall again fall to 10 cents per pound, should it ever do so, the owners of small mines and most small producers will have to retire from the field. It will then be possible for only companies having heavy bodies of at least fair-grade ores and making the metal on a large scale to continue the business with profit. Even some companies thus situated have within the past two or three years found it expedient to restrict production or close their works altogether. None of the Arizona companies, not even the largest and most prosperous, have, during the above period, run their smelters to their full capacities. These companies, influenced by the present high prices for copper, having only recently gone into full blast, and yet these parties have never disposed of the product of their mines for less than 10 cents per pound, the prices realized having generally been much more.

At 15 cents per pound, the American mines could supply nearly the whole world with copper. With the price reduced to 10 cents the output of these mines would be proportionately less.

ACADEMY OF SCIENCES.—At the meeting on Monday night Julius Koehig and Wm. T. Baggett were proposed as members. The death at Berlin of Baron Von Richtofen, the famous geologist, was announced. At the time of his death he was President of the Geological Society of Berlin. M. F. Gutzkow spoke of the deceased as a gentleman of many virtues and a profound student, highly respected by all who knew him. Dr. Harkness spoke briefly of the pine-tree fungus, a growth discovered by him some years since near Colfax, in this State. Dr. George Hewston read a short paper on the lamprey. It was reported that 131 volumes and pamphlets had been received in the library.

TIN.—A Chicago company is now running the only tinmill in the country, on the tin ore from mines in the Southern Black Hills of Dakota. It is said there are fully 100 tin mines within 15 miles of Custer sufficiently developed to warrant putting up mills. Tin concentrates were recently sent to Chicago to be smelted, and the result will be the first American tin ever put on the market.

## Cases for Entomological Specimens.

Mr. Chas. F. McGlashan of Truckee possesses probably the best entomological collection on the Pacific Coast, and certainly the best arranged one. The collection is especially rich in butterflies, as he has spent many years in gathering the different genera and species. Aside from his own collection, Mr. McGlashan supplies those found on this coast to Eastern and European collectors. His system of preserving and exhibiting specimens is novel and very effective. The specimens are so arranged that the lower as well as upper side may be observed and studied, and the method of mounting is such as to prevent the attack of any parasitical insects.

Mr. McGlashan has recently patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, his peculiar system of preserving and exhibiting entomological specimens. The case is made wholly of glass, preferably in the form of a six-sided box. It is made in sections, each side being a separate piece—that is to say, the top is one piece of glass, its bottom another piece of glass, and each of its sides one piece of glass. The meeting edges of each piece are beveled or chamfered to an angle to suit the particular case, and these joints are thoroughly cemented together, so that the sections of the case become practically a single piece, forming a hollow shell or casing which is permanently and hermetically sealed.

Before finally sealing the sections of the case the specimen is placed in position in the following manner: To the inner surface of the bottom section is firmly cemented a small piece or standard of soft wood or cork, and on top of this a small sheet of absorbent material, such as unsized or blotting paper. The impaling pin is then passed through the body of the specimen and through the blotting paper, its point being inserted into the cork, so that the specimen is thus supported in approximately the horizontal central plane of the case and may be observed from all sides.

The piece of cork or soft wood which serves as a standard differs from ordinary things of the kind, in that, before being placed in position, it is treated with a suitable insecticide—such as orosote, carholie acid, cyanide of potassium, chloroform, etc.; and the piece of absorbent paper is treated in the same way. The pieces of paper, in addition to its object of giving forth a vapor destructive to parasites upon the specimen, serves also to steady the impaling pin in the cork standard, and further, the medicated cork and piece of paper will prevent the injurious attacks of those parasites that may drop from the specimen upon the bottom of the case.

The main feature of the invention is the mode of preserving the specimens, which consists in mounting them within an all-glass case permanently and hermetically sealed. Each specimen is excluded from the air for good. No harm can come to them, as would be the case if doors were provided to afford access as in an ordinary show-case or where the joints are made simply with paper pasted over them, for in both instances the air, dust and dampness find access to the interior and soon spoil the specimen.

The specimen may be inspected from all sides and above and below. The construction of the case is of the simplest character, requiring no ledges, dovetails, grooves or clamps to hold the sections together, but simply requiring the edges to be mitered or beveled to other suitable angles and all held together as one piece by means of a proper cement. Hermetically sealing the case prevents destroying insects from getting in. The label or description of the specimen, its history, and any matter of interest connected therewith, may be firmly cemented to the inner surface of the glass.

The Bald Mountain Extension Co., a Sierra county drift mine, has, during the past two months declared two dividends, Nos. 16 and 17, aggregating each \$3000. Everything is prosperous at the mine, and 70 men are kept at work. Some friends of the PRESS are interested in this rich mine, and we are pleased at their good fortune.

SPECIAL circulars of air compressors for elevating acids, working pneumatic riveters and sinking caissons for piers of bridges, also of vacuum pumps for ssaling incandescent electric lamps, have been issued and can be had by addressing the Clayton Air Compressor Works, 43 Dey street, New York.

## Mexican Mines.

We had a conversation this week with a gentleman who has just returned from Sonora, Mexico, and who, while he thinks the mining region a very rich one, does not think it a favorable place for Americans to invest. He says the moment the officials find a mine is paying they also discover new means of taxing its owner. Labor is cheap but provisions are high. In Sonora there are 18 or 20 American reduction works, but only four or five are running. There are many prospectors and miners, but they seem to have a hard time of it. It is difficult to get any very good food, and even

themselves. In this way mines can be bought cheaply enough, for everybody seems to have them. Reduction works are few, and what there are belong to private companies who only work their own ores.

THE DIVIDEND PLACER MINING Co., recently incorporated, is to open mines in Kelley Creek district, White Oak township, El Dorado county. We have seen the prospectus which states that the company has purchased and bonded the Pelton placer claims and others, making a total of 393 acres, of which 150 acres is considered first-class mining land. Various owners held this land, but the lower claims con-

PLAN VIEW OF INTERIOR OF BOX FOR THAWING GIANT POWDER.

rich people were satisfied with tortillas and beans. There is little show for small capitalists, and freighting and teaming is very expensive. Water is usually to be had from springs on the mountain-sides, but bodies of water for large mills are rare.

The ledges in the mountains usually take a southeasterly course. Sometimes in this foot-

controlled the water so that little work was done by the others. There has, however, been work enough to have yielded about a quarter of a million of dollars in gold dust, with only about a third of the property mined, and that not thoroughly. The company thinks it will take out several hundred thousand dollars' worth from the claims it owns. The prop-

SECTIONAL VIEW OF BOX FOR THAWING GIANT POWDER.

hills, or on the dead level, very rich pockets are found which are easily worked. The classes of ore in the mines vary greatly. Some is free-milling, some smelting, and some require roasting; this occurs in mines very close together.

Our informant saw a mine only three miles from the railroad which has some old shafts and tunnels upon it, and on the dump about 10,000 tons of refuse ore which was thrown away by the miners of a hundred years ago, when the picked ore was worked in arrastras. Assays of this refuse rock went \$84 silver, \$20 gold, \$60 silver, \$15 gold, and \$58 silver and \$30 gold.

There was plenty of wood, and water could be procured about two miles distant. Within a belt of a mile there were three mines of this character. Everybody has mines for sale, but the only way to get hold of good ones is to go there and stay a few months and see the mines

erty is to be worked systematically and a reservoir is to be made of sufficient capacity to insure a supply of free water for the entire year; ditches are to be built and pipe purchased, for which purpose 2000 shares of the stock are to be sold. The management expects to complete all preparations and commence working by December of this year. A. J. Hare, 173 Railroad avenue, South San Francisco, is secretary and D. C. W. Hodgkin president and treasurer of the company.

THE Sacramento Bee says: Ground has already been cleared for extensive additions to the Southern Pacific Company's shops in this city. The shops will be increased about one-third, which means the employment of at least 1000 more men.

On the 17th inst. Isaac Thatcher, a miner, was injured, though not fatally, by boxes falling on him in the Bald mountain extension dump.

## Thawing Out Giant Powder.

A good many accidents happen in the mining regions every winter from thawing out frozen powder. There are proper means for doing this, but they are not always taken advantage of. Mr. Wm. O'Keefe of Helena, Montana, sends us sketches of a box intended for thawing powder, which can be made by any one. It will thaw out the powder in 20 minutes, and keep it in condition for three or four hours after the candle has gone out. The box may be nailed up to the wall near the work and needs no watching, as the candle cannot be blown out. It is made out of a candle-box, and three short pieces of candle will work it 24 hours.

One side of this candle-box forms the top. The box *A* is 17 inches long, 9 inches wide and 10 inches deep, with sides extending half an inch above the ends. It is covered with paper on sides, bottom and top, and then half-inch board sheathing put over that. *B* is the top or lid of the box to lift off. Around the outer edge and on top of the lid is tacked a strip of old gum hoot-top with the lining side down to keep the joint close. The lid should have an eight-inch play so it will come off easily, and the rubber extends over and covers up the open joint.

*C* is a piece of tin 6x13 inches, nailed to the bottom of the lid to reflect the heat downward to the powder. *D* is a piece of board 3½ inches high to form a bin at each end of the box. *E* is a rack on top of the board *D* on which to rest the powder. *F* is a bin filled with oatmeal or huckwheat. It is partly covered by the rack *E*. This will retain the heat a long time, and if the powder should "melt" the drops cannot explode by concussion. Charcoal dust should not be used.

*G* is a piece of board covered with tin, and there are two pieces of hoop iron nailed upon it to grip the candle. They do not extend entirely around the candle, so the grease will drop down and cool. This is lifted in and out. *H* represents the candle, four inches long, and *I* is the handle to the lid.

Mr. O'Keefe devised this box last winter and has used two of them while he has been running some tunnel work. The boxes work to perfection, he says. The powder was not easily thawed on the bodies of the men in that cold climate, and the time lost, and danger with a stove, is well known. In this box the sticks are thawed to the center, and one may go at any time and find the powder ready.

A three-eighths hole should be put on the side near the bottom of the candle, and two should be made in the lid. If the candle will not burn, more holes may be made in the lid. Care should be taken not to make too many holes, however, as this will result in cooling the inside of the box. As Mr. O'Keefe says, carrying powder makes some men sick, and when put in a boot it is only half-thawed. Hot water cannot always be procured, but this box furnishes a good and safe means of thawing powder.

It is proposed now to carry into effect the original proposition of making a large canal bringing water from the American river to the town of Folsom. It is to be six feet deep, 32 feet wide and with a fall of nearly a hundred feet. This will give employment to prisoners and give power for manufacturing purposes, and make Folsom a manufacturing town with unlimited water-power. The canal will also furnish water to irrigate a large tract of land.

VICE-PRESIDENT OAKES of the Northern Pacific says the sale of 80,000 acres of timber land in Washington Territory, within 30 miles of Tacoma, has been consummated. The transaction involves the construction of a line from Tacoma, to be known as the Tacoma Southern, to cost \$2,000,000.

THE four Assistant Commissioners to the Melbourne Exposition will be F. B. Wheeler of New York, L. R. Miller of Lynchburg, Va., Mr. Stevens of Boston, and Mr. Kemble of New Orleans. The Chief Commissioner is Frank McCoppin of San Francisco.

THE Hawaiian sugar crop this year will amount to over 100,000 tons, of which about 60,000 tons come to the American and the balance to the San Francisco refinery.

THE Santa Rosa & Carquinez railroad is rapidly nearing completion.

## MECHANICAL PROGRESS.

## Important Investigation in Regard to Manganese Steel.

Two very important papers were presented at the late meeting in London of the Institute of Civil Engineers, by Mr. R. A. Hadfield, giving the result of his important researches into the promising field of steel manufacture. The papers were entitled "Manganese in its Application to Metallurgy," and "Some Novel Properties of Iron and Manganese."

## Manganese Steel for Castings.

Mr. Hadfield said that his company, some time ago, was in search of a material suitable for making castings which should possess hardness and toughness, as ordinary steel castings did not combine those qualities. The question of manganese was one of the subjects most particularly treated. The result of experiments showed that, while the belief hitherto held that steel became brittle and comparatively worthless when the manganese exceeded 2.75, was correct, when more of the same metal was added, so as to obtain in the material under treatment not less than seven per cent of manganese, the result was a new metal.

The apparent paradox thus took place, that while manganese alloyed with iron, if present in the proportion of not less than 2.75 and up to 7 per cent, gave a very brittle product, when its proportion was increased to not less than 7 and up to about 20 per cent, the result was a material possessing peculiar and extraordinary strength and toughness.

## Experiments With Cast Bars Containing Manganese.

The brittleness of the cast material seemed to partake more of the nature of glass, or other similar substance, than of steel. Cast bars, about 2½ inches square in cross section, 30 inches long, were supported upon bearings 2 feet apart, and broken under hydraulic pressure, the breaking load being carefully noticed in each case. One of these specimens, containing 0.37 per cent carbon and 4.45 per cent manganese, was fractured under a pressure of 3½ tons; while a bar of ordinary cast iron stood 12 tons, and the higher percentages of manganese, 17 and 20 per cent respectively, stood 29½ and 38 tons.

## Further Valuable Experiments.

Another instance was afforded by a bar casting containing 4.73 per cent manganese being dropped from a height of three to four feet on a floor paved with cast iron, when fracture occurred in two or three parts of the bar at the same time, showing its extraordinary fragility. Pieces from another specimen, containing 0.48 per cent carbon and 4.9 per cent manganese, though exceedingly ductile when hot, in the cast state, when cold, could be reduced by a hand-hammer to a fine powder, no cohesion seeming to exist between the particles.

## The Experiments Continued.

On the other hand, a specimen of forged material, containing 13.75 per cent manganese, and 0.85 per cent carbon, when water-toughened, had a tensile strength of 65 tons per square inch, with 50.7 per cent elongation; and another specimen, 69 tons and 4.6 per cent respectively. In the latter case the tensile load, calculated on the area of the bar at the moment of the fracture, was equal to 102 tons per square inch. Tools made from this material, said Mr. Hadfield, had afforded some remarkable results.

## The Qualities of Manganese.

The experiments of Mr. Hadfield have now led the firm to the conclusion that manganese possesses in a most remarkable degree toughness to resist severe usage, and hardness to prevent permanent set without bending or buckling.

## How to Prove Manganese in Steel.

An approximate idea of the amount of manganese contained in steel, said Mr. Hadfield, might be formed by passing a magnet over specimens; as the percentage of manganese increased, the effects of the magnet diminished. Upon reaching about eight per cent, there was no attraction in the bulk, though five drillings were influenced; but when 20 per cent was reached, a magnet capable of lifting 30 pounds of ordinary steel or iron would only lift pieces weighing a few milligrams.

We collate the above from the English correspondence of the *American Manufacturer*.

AMERICA'S IRON AND STEEL PROGRESS OF SERIOUS IMPORT TO ENGLAND.—Sir Bernard Samuelson, a gentleman of large experience as an English steel-master, is warning his countrymen against the danger which threatens England on account of the rapid advance which this country is making in its iron and steel progress. He warns his countrymen to prepare for the increasingly serious competition from nations who are already competing with England. He says: "Of the increase of 760,000 tons in our equipments of iron and steel last year, compared with those of 1886, about 400,000 tons were due to increased demands from the United States. The enormous increase and production of iron and steel in the United States did not," said Sir Bernard, "at present affect our trade in neutral markets. Still it was worth while to mention that whereas, in 1881 the production of pig iron in the United States was only one-third that of the United Kingdom, it has been increased from year to year, till last

year it amounted to more than seven-eighths of England's own production." Some of the English iron-masters are flattering themselves that they will be greatly benefited by our proposed tariff revision; but Sir Bernard tells them that such revision, if it is realized, will not be without its drawbacks.

## Casting Great Guns.

The big gun recently cast at the works of the Pittsburgh Steel Casting Company, at Pittsburgh, has been taken from the annealing furnace and found to be in excellent condition. It was put into the furnace on February 24th, and gradually heated up to 1400° F. Then it was slowly cooled and hardened, again raised to 1400°, and after being allowed to remain at that temperature for a time, finally withdrawn from the furnace after having remained there two weeks, the heat being kept up by means of natural gas. Superintendent Hainsworth has expressed himself as being perfectly satisfied with the results so far, and expects to have the gun ready to ship by the 20th inst. The final test will take place at Annapolis, and if it proves successful Mr. Hainsworth is ready to begin the casting of a gun 111 tons, as large as any ever cast.

The diameter of the gun's bore is to be increased one-half inch. On trial it will be placed by the side of one of the "built-up" guns and fired by alternate shots. If the trial should prove a success, of which the builder, Mr. Hainsworth, has no doubt, it will work quite a revolution in the manufacture of great guns.

England's largest built-up gun weighs 111 tons and cost \$225,000. It is made of 43 separate pieces, is 43 feet long, and will throw a projectile 13 miles, which is five miles farther than any American gun. If this gun is a success Mr. Hainsworth will offer to make one of equal size and performance with the great English gun, with a guarantee of better quality, and at a cost of only \$175,000, a saving of \$50,000 over the cost of the English make. Thirty years ago the largest gun made was only ten feet eight inches in length, and weighed but five tons.

The discovery of Lieut. Graydon, that dynamite shells can be safely fired from common ordnance, as at present constructed, is another important step in this direction. The havoc-working power of shells so charged and projected is almost irresistible, and is considered quite sufficient to destroy the most powerful ironclad, with a few well-aimed discharges.

WIRE-DRAWING.—At one of the meetings of the German Society of Engineers of the Lenne district, Herr Baedeker delivered an address embodying the results of a series of experiments to test the accuracy of the opinion held by wire-drawers that wrought iron is least affected by excessive pickling, mild steel a little more and hard steel considerably more. At the same time he undertook to investigate the question whether sulphuric acid and hydrochloric acid acted in a different way—that is to say, whether either of these acids pickle more readily than the other. The test was carried out by using as a basis for comparison the number of bendings which a wire would resist without breaking after the different treatment it had received. The result was that wrought iron and mild steel are attacked about the same way, while hard steel suffers more, and that there is very little difference between the action of sulphuric and hydrochloric acid, the drawback with the latter being that the fumes are more troublesome to the workers. It was ascertained that a short period of pickling suffices to considerably affect the ductility of hard steel. It is a well-known fact that wire over-pickled becomes fit for use again when allowed to lie in a dry spot for a considerable length of time, and that annealing may be used to remove the objectionable influences of pickling. Both these methods are not, of course, applicable in ordinary practice, and, therefore, another method was studied. Mr. Baedeker found that moderate warming for a fair length of time brings back the quality of the wire to its ordinary standard, and, as most wire is dipped into milk of lime and is then dried, the heating required can easily be carried out in drying ovens.

REMARKABLE MARINE ENGINES.—The enormous size that modern marine engines have reached can hardly be believed by those who have not watched the growth of them during the last few years. The City of Rome's engines have six cylinders, three of which are over seven feet in diameter; and they indicate 11,890-horse power. The Etruria and Umbria each have three cylinders, two of which are nine feet in diameter and the remaining one six. Thanks to these monsters, the Atlantic ocean has become a great ferryway, and the voyage that once required over a month has been made in six days and a quarter. None of the celebrated Atlantic mail steamers have triple expansion engines, but two large vessels that are now building are to have triple engines with forced draft. They are to develop 18,000 horse power and are expected to eclipse all of the others in point of speed. Two vessels of the present navy of Italy develop 18,000 horse power, and two others, now building, are to develop 19,500. But the most wonderful marine engine yet designed are those of the Sardegna, which are to comprise 12 main cylinders, arranged triple expansively, and are to develop 22,800 horse power. This vessel, in all, is to contain 62 engines, comprising 90 cylinders.

## SCIENTIFIC PROGRESS.

## Ancient Microscopes.

Mr. Frank Crisp, vice-president and treasurer of the Linnean Society, and secretary of the Royal Microscopical Society, gave a lecture at the Royal Institution on Feb. 3d on "Ancient Microscopes." In the library, on specially placed stages in the theater, and on the lecture table, were some 600 microscopes of early dates, while on the tables of the library were shown many early books containing figures of microscopes.

Among the works were those of Robert Hook, 1665, Adams, with a plate of a solar microscope, Pierre Lyonet, with a plate of a dissecting microscope, and a practical work by Adams, a maker, dated 1747. The first reference made by Mr. Crisp in his lecture was to one of the latest productions of Powell and Leland as a type of our present perfection. Turning from this to the odd shapes of the early works, Mr. Crisp said he meant in his title by the word "ancient" any microscope made earlier than 100 years ago. We now look for clearness of vision, stability and absence of all needless adornment. It is interesting to see from what our present work has been evolved. One striking point is that though we now make only of brass, the "ancients" made of wood, ivory, tortoise-shell and papier mache. But they also excessively ornamented their microscopes.

To illustrate this there was held up an elaborate stand for a really weak microscope made for Cardinal Lambart, afterward Pope Benedict XIV, where the silk linings and the large space for the papal insignia made the whole affair ludicrous in the eyes of a man of science. After others belonging to popes and distinguished people had been shown, a strange green-colored one for George III was held up. But, it was remarked, no good recorded work had come from any of these. They were like toys. In tracing stability for a microscope it was shown how long it took to acquire this. Some were placed on the table which a puff of breath blew over. At length there seemed to be acquired stability to such an excess that adjustment was difficult.

It appeared to us now strange that it took so long for the right use of a mirror to be understood. The old way of getting a focus was really barbarous. Some drawings of old microscopes were shown on the screen, odd pictures with tubes five feet long, and men standing on hillocks to use them. The explanation was that where an eye was at first used to indicate the point of observation, subsequent draughtsmen put in the entire human figure, and so lengthened tubes for artistic effect. On the whole, however, we have to be thankful for what the ancients did, as from their work has come our modern powerful instrument.

IMPROVEMENT OF LAND BY NITRATE.—M. Barthelot has sent to the "Academie des Sciences" an exceedingly interesting note upon his work in reference to the general conditions under which azote (nitrate) undergoes fixation in vegetable land. He has found from his long experiments that certain clayey soils and certain sands have the property of fixing atmospheric nitrate, and of enriching themselves slowly and progressively in organic nitrate matter, consisting of organisms or derived from them. Land should not be considered as a mineral substance, inert and invariable in its composition, but as matter filled with living organisms, of which the chemical composition, and especially the richness in niter, vary and change according to the presiding conditions of the vitality of these beings; in fact, these organic compounds appear to belong to the tissues of certain microbes contained in the soil. In order that these phenomena may occur, the soil should be porous, that is, accessible to the circulation of air, able to receive a small measure of water, and be of a temperature varying between 15 and 50 degrees. The phenomenon of the enrichment of the soil in nitrate matter would therefore differ according to the seasons. Again, it would be limited in the case where no vegetation, properly so-called, were developed in the ground, in which case the possibility of its being produced on the part of these beings or substances contained in the land appears to cease after a certain time. For practical agriculture there is as yet no definite conclusion to be drawn from these splendid works, but it must be recollected that the problem is quite distinct from that of nitrification in arable land, as otherwise great confusion would arise from erroneous conclusions.

PURIFICATION OF WATER BY ELECTRICITY is the latest electric discovery. This is said to have been accomplished by two Pittsburgh gentlemen, Prof. Black and R. W. Smith. A patent has been applied for and details are for obvious reasons suppressed; but it is claimed that very remarkable results have been achieved, and that the destruction of all animal and vegetable life, and the entire removal of everything deleterious to health, can be successfully accomplished, resulting in the production of water absolutely pure. It remains to be seen, says the *Western Electrician*, whether this can be accomplished on a sufficiently economical basis for general use. If so, it will be a great boon, as impure water is a fruitful cause of disease, and there is probably very little water in use which is even

approximately pure. In the rural districts the water obtained from wells and springs is largely impregnated with mineral impurities, and surface water is filtered through strata of rock and soil, while the unfiltered surface water obtained from brooks and ponds is still more impure. In large cities the sewage is, in many cases, a constant menace to the purity of the water, and wells in the vicinity of cemeteries, barnyards and privy vaults are poisoned fountains.

## What a Blizzard Is.

A person ought to have gained a clear idea of what a blizzard is after reading this extract from the *Toronto Globe*:

A blizzard is simply a strong, cold wind moving unchecked over leagues of light, unpacked snow. It sweeps up that which has previously fallen, carries it away in the color of a vast shaken fleece, distributes it so that each atmospheric atom has its little particle, and drives along all with a steady fury. Whether fresh snow is falling can seldom be determined by people out in a real blizzard. As far as the eye can see upward, and that is but a little space, the hurry of minute pellets hurling through ether across an unrevealed sky prevails, and the hurrying sameness on every side is varied only by occasional tall and hending wreaths where the wind whirls in shifting column. A confusion of the senses, comparable to none produced otherwise, spalls one submitted to the enormous and blinding force of such a snow-filled wind, and scarcely a distinct thought remains except that the awful cold forbids crouching for rest and shelter. To our personal knowledge one in such a storm keeps with difficulty upon a railway track lifted three feet above the surrounding prairie, and may be lost by five steps the wrong way after stumbling down from the embankment, which, being white, becomes instantly invisible. It is recorded on good authority that teamsters halting with their horses have been snowed over 30 feet deep by blizzards, and have survived by heating out breathing chambers till the cessation of the storm enabled them to dig themselves to upper air. The formation of a drift about a halted man, or horse, or sleigh, is sometimes wonderfully speedy, and the drift, once established, grows by virtue of its obstructiveness. In some well-authenticated cases lost persons have been found by the drifts over them and dug out alive, in others the spring has revealed corpses still unthawed among the last white relics of winter. In blizzards people have often been unable to see across the street of a northwestern town, and sometimes men lose their direction in trying to reach the opposite side of a well-built way.

THE MULTITUDE OF THE STARS.—In some remarkable mathematical observations by M. Hermite concerning the number of stars, he shows that the total number visible to the naked eye of an observer of average visual power does not exceed 6000, and of these the southern hemisphere contains somewhat the larger number. In order to see this number of stars the night must be moonless, the sky cloudless, and the atmosphere pure, and here the power of the unaided eye stops. An opera-glass will bring out 20,000, while a small telescope will bring out at least 150,000, and the most powerful telescopes yet constructed will show more than 100,000,000. Of stars of the first magnitude or greater apparent brightness there are 20, and, in passing from one order of magnitude to the succeeding, it is found that the number of stars follow the law of an increasing geometrical progression, of which the first term is 19, and the ratio three, there being, therefore, 57 stars of the second magnitude, 171 of the third magnitude, and so on, the number having thus increased to over 30,000,000 when the 14th magnitude is reached. M. Hermite concludes from his various observations that the light emitted by all the stars upon the whole surface of the globe is equal to one-tenth of the light of the full moon.

ELECTRIC RESISTANCE OF COBALT.—Dr. G. Fae of the Royal University of Padua has made a series of experiments on the variations of electrical resistance in cobalt and antimony in a magnetic field. These show that when antimony is brought into a magnetic field there is an increase of electrical resistance both along and across the lines of the magnetic force of the field. The increase across the lines appears, however, to be the greater of the two. In the case of cobalt a diminution of resistance was found across the lines of force, and an increase of the same along the lines of force. Antimony, therefore, behaves like bismuth, and cobalt like iron and nickel.

BLACK GOLD—A NATURAL ALLOY OF GOLD AND BISMUTH.—Mr. R. W. E. MacIvor has recently analyzed a specimen of black gold obtained at Maldon (Victoria) found in the granite veins which are met with in the quartz of that country. When fresh broken, the ore is crystalline, malleable, and of a silvery appearance, but on being exposed to the air, it becomes dull and blackens. Running through a sieve eliminates the bismuth and leaves the pure gold. Mr. MacIvor's analysis gives its composition as follows: Gold, 64.211 per cent; bismuth, 34.398 per cent; silicate matter, 1.591 per cent. The black gold is therefore in reality a natural alloy of gold and bismuth.

## GOOD HEALTH.

## The Human Stomach.

Dr. C. N. Ellenwood of this city, in a recent lecture before the Cooper Medical college, gave the following description of that wonderful organ—the stomach: The doctor described the average healthy stomach as a muscular sac, lined with a mucous surface, the whole resembling the winding of a Scottish bagpipe. It is from 13 to 15 inches long, and its walls are of the thickness of about three sheets of blotting paper. In a transverse direction it is about five inches and its normal capacity is about five pints. Experience or education has incurred in the stomach the habit of distension, an important function of which the old nomads have availed themselves. But in our present dissipated condition, when these meals are taken daily and easily obtained, there is no need for such an education of the stomach, and five pints is even sufficient capacity for any Thanksgiving dinner.

The wonderful activity of the stomach in the assimilation of food, the revolving of the latter in from about one to three minutes in order to be completely churned up to facilitate digestion, the expulsion of the soft particles of food into the intestines, the retention of the hard substances followed by their expulsion, if not of too great caliber, were in turn described.

The muscular fibers producing the churning process and the propulsive power in ejecting the juices to precipitate digestion, were treated of in turn.

Considerable attention was also devoted to the wonderful structure of the mucous membrane, the depressions in whose surface resemble vacuoles, being open mouths, 1,400 of an inch in diameter. They are thickly placed, and are in close relation with the blood-vessels, supplying the material by which the gastric juice is elaborated. How these glands form the juice, the speaker said, was extremely difficult to explain, but he made the comparison to the growing and nutrition drawing roots of plants, the blood in the glands furnishing the nutritive material.

During the intervals of digestion the stomach is inactive, and the membrane is covered with a translucent, viscid, alkali fluid, furnished by the goblet cells. Fright from a sudden shock arrests at times for hours the process of digestion; so does any depression of the system. Fear, rage, excitement, stimulants, or the overloading of the stomach have the same effect, all of which teaches that we must, when sitting down to the table, be free from the depressing influences of the mind over business or other matters, and appreciate the danger of depressed physical or mental conditions of every kind. Busy people who are the ones to abuse their stomachs most by quick eating and by having their minds weighted with the cares and troubles of business, are the first to complain.

The daily secretion of gastric juice in the stomach is 14 ounces, which is passed off with the assimilated food, and the secretion is proportionate to the amount of food taken, but less when eating is observed too frequently, while overloading likewise delays digestion.

The process of the transformation of foods in the stomach and their dissolution into component parts to be absorbed and serve the purpose of nutrition to the body, were elaborated upon, but the lecturer freely admitted that these chemical and physical changes were not yet thoroughly understood. The speaker inveighed against the use of condiments, highly seasoned articles of food, and the pleasures of the table generally, asserting that the consumption of plain, simple and wholesome viands, intelligently cooked and gracefully served, are by far more conducive to good health and sound intellect, between which and the stomach there is a close relation.

The speaker also ridiculed the saying that to eat well is to leave the table with the feeling that one could eat more. His advice was to eat enough to satisfy the appetite, but not leave the table either hungry or feeling stout, heavy, or uneasy.

**POISON FROM HUMAN TEETH.**—The poison conveyed by the human teeth is one of the most annoying that a physician ever has to deal with, writes Dr. A. C. Robinson. "A bitten ear or nose is months in healing, where a more important wound inflicted by an instrument would readily yield to simple remedies. I have under my attention several and most complicated cases of blood poisoning, in which the patient had but slightly abraded the hand in the course of a fight by striking the knuckles against the teeth of his opponent. I have known hands thus poisoned only saved from amputation by the application of all the resources of science. Tobacco or whisky, or disarrangement of the stomach from many other causes, may be responsible for this poisonous condition of the teeth, and I am not prepared to say that a man with good health and a clean, sweet mouth would convey the poison, but I can only speak of the frequency of this class of cases and the difficulty of attending them successfully."

**TOO MUCH HUGGING AND KISSING OF CHILDREN.**—It is precisely in that natural aptitude for emotion, in that type of mind which is exquisitely sensitive to impressions and generously swayed by sympathetic feeling, that one of the great dangers to the perfection of womanhood, physical and mental, may be said to reside. Many and varied influences tend to in-

crease this emotional excitability until it often becomes a fixed habit of mind; as undens sensibility of the supreme centers to emotional ideas is created, which can only be maintained at the expense of sound health of body and of mind. First among these are certain home influences that are brought to bear upon a little girl from her earliest childhood, which foster in her self-consciousness and introspection. Dr. Taylor says: "In my large practice among children I am certain that scores are literally killed by the excessive amount of emotional excitement which they are forced to endure. All this hugging and kissing and talking to them is to excite responses of the same emotional nature in the child for the pleasure and gratification of the parents and friends." And again he says: "I believe that three fifths of the spinal diseases which occur in children are directly traceable to mental overaction. And this because a large proportion of these cases get well without other treatment than a withdrawal from the exciting cause of emotional disturbance."—*Pop. Science.*

**DANGER IN FALLING TREES.**—Danger from falling limbs continually lurks in the redwoods during the working season, and many accidents, fatal or otherwise, are reported every season. When a heavy tree comes crashing to the ground branches are broken off by coming in contact with neighboring trees. These great limbs lodge and sometimes remain in that position. But often, and when least expected, a breath of wind will loosen them from the lodgment and hurl them on the head of the workmen below. Close watch for these dangers has to be kept by those employed in the redwoods.

## USEFUL INFORMATION.

**ARTESIAN WELLS LONG KNOWN IN CHINA.**—The more we learn of China, the more we are astonished at the multiplicity of devices, long known there, but more recently of independent discovery among the civilized nations of the earth. It has recently been learned that the Chinese have been using artesian wells, even through the hardest rock, from time immemorial. The French Abbe Huc, lately returned from an extensive tour and long residence in China, describes the process of boring these wells employed there as follows: "A wooden tube six feet in length is first driven down through the surface soil. This tube is held at the surface of the ground by a large flag-stone, having a hole in the center to allow the tube to pass through and to project a little above it. A cylindrical mass of iron, weighing about 400 pounds, hollow and pointed at its lower end, and having lateral notches or apertures, is jerked up and down in this tube at the end of a lever, from which it is suspended by a rope. This kind of "monkey" disintegrates the rock, the debris of which, converted into sludge by water poured in, finds its way through the lateral apertures into the interior of the cylinder. By raising the latter at intervals, this sludge is removed from the hole. The rate of boring in rock of ordinary hardness is one foot in 12 hours. Only one man is employed at one time to work the lever. By this means wells of 1800 feet deep are sunk in about two years by the labor of three men relieving one another every six hours."

**HOW TO CARE FOR SILVERWARE.**—To know how to take care of silver is a very important thing when one has any silver to take care of. A good deal of valuable ware is reduced to a condition where it is fit only to be melted by improper cleaning and careless handling. Silver articles when not in use should be kept in prepared cotton flannel bags to protect them from the sulphurated hydrogen of furnaces and illuminating gas. They should be kept in a dry place, and, if likely to remain a long time, the silver should be perfectly clean and the bags closely wrapped in stout paper. For daily care of silver it is best to use hot water, castile soap, a stiff brush and chamois leather. In using plate powder to restore the brilliancy one should always go to a reliable silversmith for a good article, as much of the powder indiscriminately sold is no better than a fine sawdust or a lot of quartz, and wears off the surface of the metal. Gilding ought to be rubbed as little as possible, and silver stoved, decorated with colored alloys or oxidized, can be kept in condition by rubbing with a damp linen cloth with a very little plate powder.

**A MARINE NOVELTY.**—A press telegram from Cincinnati, O., says: A wonderful little watercraft was put through a test on the Miami river yesterday and attracted much attention. It is called the marine locomotive, and is intended for pleasure riding. The wheels are both air and water tight. The model used was 10 feet long and a weight of eight persons was placed aboard of it; and the machinery, although only of clock-spring make, caused the small boat to make an average speed either way, of from 14 to 18 miles per hour. This peculiar craft is the invention of Captain Peter Eichels. He proposes making a more complete test of a larger and better appointed vessel on the river and the canal. He is sanguine that a boat of this class, fully equipped, will be enabled to make a speed of 30 miles per hour.

**MAGNETIC PROPERTIES OF IRON.**—A series of experiments, with a view to determine the temperature at which soft iron becomes non-magnetic, have recently been carried out in the

laboratory of the Sorbonne, by M. Ledehoeer. The bar of iron experimented on was first insulated by being completely covered with mica, over which was wrapped a helix of platinum wire, and the whole was then placed inside one of two exactly similar induction coils, which were connected with a Wheatstone bridge, so that their relative self-inductions could be compared, and would, of course, be equal when the iron lost its magnetic properties. The bar was heated by passing a current through the platinum helix mentioned above, and the rise of temperature was measured by means of a thermometer. The results obtained were that up to a temperature of 680° Cent. the iron preserved sensibly the same magnetic properties as when cold, but beyond this temperature the decrease of permeability was very rapid, and the bar became completely non-magnetic at 770° Cent.

**TO DETECT ALLOYS IN GILDING.**—A solution of chloride of copper will show the difference between gilding for which gold has been used and gilding with alloys of inferior metals. If the gilding be imitation gold, a touch of the solution will give a black mark, copper separating out through the zinc in the yellow metal; with pure metal no discoloration will occur. The test can also be effected with a solution of chloride of gold or nitrate of silver, the first of which will give a brown spot, the second, a gray or black spot; neither has any effect on gold. Common gold goods of 14-karat gold will not change their color with nitrate of silver. Leaf-gold is tested by being shaken up in a closed bottle with sulphur chloride. Beaten gold will show no alteration, while "metal" leaves will grow gradually black.

**SUBSTITUTE FOR GUM ARABIC.**—A substitute for gum arabic, patented in Germany, is made as follows: Twenty parts of powdered sugar are hoiled with seven parts of fresh milk, and is then mixed with 50 parts of a 36 per cent solution of silicate of sodium, the mixture being then cooled to 122° F., and poured into tin boxes, where granular masses will gradually separate out, which look very much like pieces of gum arabic. This artificial gum copiously and instantly reduces Fehling's solution, so that if mixed with powdered gum arabic as an adulterant, its presence could be easily detected. The presence of silicate of sodium in the ash would also confirm the presence of adulteration.

**NEW MAGNESIUM LAMP.**—M. F. Leclercq, Paris, is about to bring out a new magnesium lamp, which is intended to replace the cumbersome and uncertain lamp hitherto in use. In the old lamp there were two magnesium tapes fed by clockwork, which had to be rewound at frequent intervals. In the new arrangement there is only one tape, and it is claimed that the lamp will burn without adjustment for 27 hours. Great improvements have also been made in the manufacture of magnesium, by which the cost of production has been considerably reduced. A firm in Antwerp is now selling magnesium at the rate of 1s. 10d., say 45 cents per pound.

**LONG DISTANCE TELEPHONE IN FRANCE.**—It is expected that the telephone will be ready to work between Paris and Marseilles on July 1st. The wire will be of bronze, and will be underground as far as Nogent-sur-Marne, where it will join the railway telegraph line. The distance is 500 miles, rather more than double that from Paris to Brussels, but the experiment of connecting the two wires between those places—the voice thus going from Paris to Brussels, back to Paris, and then again to Brussels—is considered a proof that communication will be easy.

**THE HEAVIEST BLOCK OF MARBLE.**—In the Devonshire quarries, in England, an enormous block of marble has been successfully removed, 65 feet long, 30 feet high and 25 feet thick; the weight of which is estimated at over 3000 tons; therefore, up to the present, it is the largest mass of Devonshire marble which has been discovered. This block, of a greenish black, is fine and even variegated with red veins. Already 12 columns and 8 pilasters 20 feet in height have been cut from it for the bank of Messrs. Wright of Nottingham.

**CASTING STEEL WHEELS.**—To give a greater solidity and density to the metal for wheels, it has been suggested, while the casting is cooling to give it a rapid rotary movement near the edge where it will ultimately work in. The centrifugal force gives the desired result, in pressing the liquid metal against the outer parts. This process, used in England by Mr. Webb some years ago, has lately been put in practice in a Pittsburgh foundry.

**PROTECTION OF BOILER TUBES.**—In order to prevent the rapid burning out of the front end of boiler tubes, a corrugated shield or inner cover for each tube has been devised. This shield, which may also be made with a plain surface, is to be applied at the end of each tube at the point of connection with the fire-box of the boiler. It is removable and can be easily removed when it becomes unserviceable.

**PENCIL FOR WRITING ON GLASS, ETC.**—The new pencils introduced by Faber for writing upon glass, porcelain and metals, in red, white, and blue, are made by melting together spermaceti, four parts; tallow, three parts, and wax, two parts, and coloring the mixture with white lead, red lead, or Prussian blue, as desired. These pencils are convenient in the laboratory, and save the trouble of labeling.

## ENGINEERING NOTES.

## Another Great Bridge Proposed.

The possibility of bridging the Hudson river between New York and Jersey City has been discussed before, and now we learn that Mr. Gustav Lindenthal, an engineer of some note, is maturing a plan for accomplishing the stupendous enterprise. An able engineer who favors the idea and sees no reason why the scheme cannot be made a success, exhibited to a reporter of the *Pittsburg Dispatch* a copyrighted lithograph of the proposed bridge, which Mr. Lindenthal has prepared from drawings. The bridge on paper is a magnificent structure of three spans. Beneath it are the largest ships in the world reduced in relative proportion to the size and height of the bridge, and it is found there is plenty of room for the tallest masts to pass under the colossus.

The proposition is to build a bridge across the Hudson from Jersey City to New York for the New York Terminal railway, over which all the roads centering in New York that carry passengers across the river in ferries can pass. In the city a union depot will be constructed. The advantage accruing as a result cannot be questioned. It is of the immense proportions of the bridge itself, however, of which I propose to speak. The nature of the river is such that, in order not to interfere with navigation, it will have to be crossed with one span, which must be in length 2550 feet, about one-half a mile. At once people will say that it cannot be done and it is useless to think of it. This is not to be an ordinary bridge, and the materials used will have to possess extraordinary strength to resist the strain and pressures. For example, it is calculated that the cables will each have to be four feet in diameter, or as large around as a hoghead in which china ware is packed.

Two towers will be built, each 500 feet high, down to the wharf lines, and the monster cables will be swung fastened in a mass of masonry 300 feet long, or, to be more explicit, as much as would cover a square in a city. Between the towers and the masonry two shorter spans, both together about the length of the middle one, will be suspended. Three spans will complete the bridge, and make it about a mile or more long. This is the scheme to which Mr. Lindenthal is devoting his time. The bridge will be wide enough to hold six tracks and strong enough to carry six trains at the same time.

**IMPROVING THE OHIO RIVER.**—It is proposed to improve the Ohio by constructing 12 dams between Pittsburgh and Wheeling, similar to that at Davis Island. It is proposed to put in five immediately at an aggregate cost of \$1,000,000. In addition to the advantages which will inure to navigation, it is proposed to utilize at least one of the dams for water-power, the power to be conducted to such places as may need it by electricity. A bill has been introduced into the Legislature of Kentucky to incorporate a private company for this enterprise with a capital of \$2,500,000. An Ohio exchange in alluding to the improvements referred to, says: "There have been efforts made to induce the Government to dig canals here and there. Concerning this we at present have nothing to say, except to express the opinion that at least some of them should be dug. But here is a canal made by nature, 1000 miles long and wide enough for a man-of-war, and which connects with other natural canals many more thousands of miles in length. These canals drain a region as vast as all Europe. All that the great Ohio canal needs is improvement, and surely this should be done, and as speedily as possible. There is no improvement the Government could make which would confer benefit on so many people, or on such a great scope of country, or on interests so vast and varied. This improvement is greatly needed; it is the duty of the Government to make such improvements; there is plenty of money in the Treasury with which to make this one; let it be made without unnecessary delay. We trust that in this instance Congressmen will be practical, and wise, and just."

**TOBACCO BLINDNESS.**—This infirmity, it is said, is becoming a common affliction. At present there are several persons under treatment for it at one London hospital. It first takes the form of color-blindness, the sufferers, who have smoked themselves into this condition, being quite unable to distinguish the color of a piece of red cloth held up before them. Sometimes the victim loses his eyesight altogether. Tobacco being a narcotic, naturally benumbs the nerves. When the nerves are thus benumbed people do not see as distinctly, and this defectiveness of vision tends to increase and become permanent.

**CANAL CONSTRUCTION IN CANADA.**—Canada has already expended \$50,000,000 on account of canal construction and enlargement, and the scheme giving a 14-foot draft from Lake Superior to tide-water, the Minister of Railways and Canals says, will require \$12,000,000 more. The total appropriation on account of canals which Parliament is now asked to grant is \$3,127,000. Of this amount \$997,000 is wanted to begin the construction of the Sault Ste. Marie canal, connecting Lakes Superior and Huron, to furnish Canada a national waterway independent of the United States canal near that point.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**DOYLE MINE.**—*Ledger*, April 14: This mine in Hunt's gulch was again bonded last Saturday to James Geason. The bond runs for eight months, and the purchase price is \$20,000, payable as follows: \$500 in one month, \$500 in four months, balance in eight months. It is hoped there will be some development work done on this promising property under this agreement. There are excellent indications of a good mine on this claim.

**NEWTON COPPER MINE.**—The Newton copper mine has changed hands. H. D. Ranlett, who is a business partner of J. A. Ferson, has become the purchaser. A number of men have been put to work preparing pits to roast the immense piles of ore now awaiting treatment.

**PLYMOUTH CONSOLIDATED.**—The fire in the Plymouth Consolidated mines is still raging. Every plan devised for extinguishing the fire has proved unavailing. The project of building an air chimney over the Empire shaft to create a greater draft and draw the smoke away from the Pacific has been found useless for practical purposes. A strong feeling exists that the only effectual way of putting out the fire is by flooding. This of course will do a great deal of damage, but if it has to be resorted to, the sooner it is done the better.

**MISCELLANEOUS.**—There is a report in circulation that negotiations are in progress for the sale of the Quartz Mountain mine to Eastern capitalists. The Moore mill is being repaired and fitted up with plates preparatory to being started up. It is reported that it is merely for the purpose of crushing the ore on the dump, which consists of several hundred tons. It holds out no immediate prospect of the resumption of work upon this mine, which is full of water, and will take considerable time and money to get it in running order again. Grading for the 60-stamp mill of the Amador gold mine will commence the end of the present month.

## Calaveras.

**STRUCK GRAVEL.**—*Calaveras Chronicle*, April 14: A bed of gravel was struck in the A & B mine, one day last week, in the bottom of the incline tunnel at a depth of 600 feet. The gravel prospects well.

## El Dorado.

**GRIZZLY FLAT AND VICINITY.**—*Placerville Observer*, April 10: With a concert of action and a little industry on the part of her people, there can be no doubt that Grizzly flat will soon be self again. In the north level from Station No. 1, at the Big Bonanza mine, a large vein of very fine ore is being developed. The ledge is well defined, being 12 feet in width between walls of gold-bearing vein matter, mostly quartz of a laminated character showing free gold and sulphides. The Melton mine has a tunnel in several hundred feet, showing a large vein of rich ore. The manner in which this mine is being opened, with a view to economical working, is a guarantee of success. The Young Bonanza Co. have their shaft down 75 feet and are running a level on a three-foot ledge, from which they are now working ore which is paying regularly \$28 per ton. The Sunday mine is now lying idle, the owners not having means to prosecute the work. The Mount Pleasant Co. are now sinking the shaft on the Ohio mine 30 feet south of their south line, from which they intend to drift north to their own ground. This shaft will open a large ore body which was partially opened in early days, and is known to exist on the north end of the Ohio mine and the south boundary of the Mount Pleasant, and will soon be an important development. Hoisting works will soon be erected on the ground. The Kemp has a large vein of low-grade ore, but is most favorably situated for economical working and can be made a profitable mine. There are a great many mines in the district partially developed and known to contain rich ore. S. A. Lane has bonded the Stillwagon to San Francisco parties, who are now at work making developments. At the Parker mine a 10-stamp mill is about completed and will be started up in a few days.

## Monterey.

**LOS BUENOS.**—*Cor. Salinas Index*, April 14: Work was begun on the Manchester a day or two since. The vein is opened out to a foot and a half in width. It proves to be far richer than anything they have found, and shows free gold all through the rock; one piece, weighing about 20 pounds, is on exhibition and is a beautiful specimen. It is estimated that this ore will mill \$200 per ton. We look for a second Last Chance in this claim very soon. The tunnel has been started on the Last Chance and two shifts are working day and night. This tunnel will tap the lower vein at a depth of about 100 feet and drain the mine. It is the company's intention to build a new mill of greater capacity. The contract for 100 feet on the Esmeralda is finished. The Ajax tunnel will be continued next week.

## Fresno.

**FRESNO COUNTY COPPER MINES.**—*Fresno Examiner*, April 11: One of the future great industries of Fresno county that is now attracting attention is the copper mines lying north of the San Joaquin river. Several years ago some of these mines, especially the Buchanan Hollow and Ne Plus Ultra, were worked on a paying basis. These mines proved to be rich in copper with a percentage of gold and silver large enough to be handled to advantage. The mines consisted of a central ledge with stringers covering over 100 feet of ground joining to the main vein as they go down. The Buchanan Hollow mine is to be put in operation at an early date, now that the price of copper has advanced in the market. The owners of the Ne Plus Ultra will probably sell that valuable mine or put it in operation soon. This mine is near the branch road to Raymond on the old Daulton rancho, and the patent calls for over 60 acres lying along the lead. This mine paid well and was rich in copper. However, the low prices of late years have proved detrimental to the copper-mining interests. At the time mining ceased on these mines they were remote from the railroad, and transportation was expensive, but now that the mines are on the line of the railroad and prices are advancing on the metal, we may

expect a good report from them at no distant date. Different parties have been examining these properties with a view of negotiating for them.

**A NEW LEAD IN HILDRETH.**—*Fresno Examiner*, April 11: From parts sent down from Hildreth to-day the information is obtained that James and Thomas Baker of Fine Gold have discovered a new ledge which promises, on account of its inexhaustibility, to be one of the most valuable gold mines yet discovered in that locality. The mine is located near what is commonly known as the Coon place, and two miles from the James mine. Already a number of tons of the ore have been placed on the dump, and assays made show the rock to be very valuable, running all the way from \$150 to \$200 per ton.

## Inyo.

**LOOKING WELL.**—*Inyo Independent*, April 14: The mill at Beveridge is running on Keynot ore. The mine is reported to be looking well. For some months past negotiations for the sale of the mine have been in progress, and it is said that the bargain is now very likely to be made.

## Nevada.

**THE DAYLIGHT.**—*Nevada City Herald*, April 13: The ledge known as the Daylight, which is located at Helgerson Flat, near Mayburt, is likely to put out some bullion this summer. The owners have been putting up a small mill and have it all ready to run. The rock in the Daylight has paid as high as \$60 per ton, and it is confidently believed the same kind of ore will be encountered again.

**A CANYON CREEK MINE.**—We are told that Tom Simons, who is working the Norway mine, is meeting with good prospects. The mine is owned by Mrs. Robinson, who used to keep the Central House on the Washington road. Simons leased the property last fall and commenced work. The mine has a mill and other improvements on it. It is situated on the mountain-side, midway between the North Bloomfield ditch and Canyon creek. The ledge is small, but very rich ore is frequently encountered in it. They are now crushing and the ore is turning out well. About a mile west of the Norway, Wm. Yaw is at work on the Dower mine and another adjoining, in both of which he is getting very flattering prospects. The Helgerson and Kohler claims are located down by the creek, and the owners propose to do development work on them this summer. Canyon creek district will be a bullion-producer one of these days.

**SAID TO BE SOLD.**—*Nevada City Herald*, April 11: Judge John Caldwell to-day received a letter from E. Charonot, who is in San Francisco, stating that a sale has been concluded of the Nevada City mine. Thirty thousand dollars is about the indebtedness of the mine, for which liens were filed and suits for settlement were in progress. At least this much in cash has been or will be paid, and it will go into circulation in this vicinity where all the creditors reside. It will further increase business here by the employment of men, and it will stimulate other mine-owners to start up work. It is good news and will be hailed with delight by every one.

**THE SPANISH MINE.**—A FLATTERING OUTLOOK. We are informed by a recent visitor to the Spanish mine that it is looking better to-day than it has for a long time. A recent upraise of 300 feet has developed better paying ground than has been found for years. This development affords fully a 3 years' run without further deadwork. The material now shown has better pay in it than anything encountered for years. The body is over 300 feet in width on the surface. Four nuggets of gold were found in making the upraise, the largest ever taken out of the mine, and their finding is an unusual thing. The superintendent is feeling very hopeful now, for he has had so many discouraging circumstances to overcome that it is like coming from darkness into light to get better prospects. If things continue as favorable as at present, Mr. Bradley will bring the mine out all right, pay off its indebtedness and leave the stockholders with a good paying property. If it does not, it will not be the fault of the superintendent. He has stuck to the mine through all its discouragements and deserves success.

## Placer.

**STRUCK IT RICH.**—*Newcastle News*, April 11: The quartz ledge on Bald prairie, near Newcastle, being prospected by Dr. Schnabel, B. M. Berry and A. O. Bell, has developed into a bonanza. The rock is said to be alive with gold and the ledge is a large one. It is estimated that on Monday last the prospectors took out over \$600 worth of ore, and the indications are that the lode is a very extensive and valuable one. The announcement of the big find caused quite a flurry in Newcastle on Monday, and the owners are justified in feeling considerably elated.

## Sierra.

**THE LINK MINE.**—*Nevada City Herald*, April 11: Dr. J. H. Freeman is down from Sierra county, where he is developing a drift property called the Link mine. It is located about 6 miles east of Alhambra, and 2 miles south of American Hill. W. D. Vinton and J. S. Holbrook are the other partners. It is expected, when drifts are well opened, that the mine will be very productive. In the near vicinity are numerous quartz veins, but little work has been done upon them as yet. About 2 miles above the Link is located the Pilgrim quartz mine. It will be remembered that the superintendent of this mine was found dead about 2 years ago, and it was supposed he was murdered. The mine has not been worked since that event, but is now being started up again, and is said to be looking well. The Sager drift mine is located about a mile and a half west of the Link. It is looking well and the prospect is fair of its becoming a valuable mine. Prospecting and developing of mines is going on all over Sierra county, and its prospects were never better.

**ST. LOUIS.**—*Cor. Sierra Tribune*, April 14: Everything is looking favorable in this section. The mining interest is flourishing. The Caledonia Co. of Cedar Grove is taking out good pay close to the Excelsior line, with the bedrock pitting toward the Excelsior. The Excelsior tunnel is still progressing toward the main ridge. It is now in about 430 feet, and the contractors are still working night and day. The Treasure Bros. of Gardner's Point are still driving their main tunnel ahead with the hopes of striking one of the richest mines in Northern Sierra. The Riffe Co. of Grass Flat is now working from 10 to 15 men, and their ground is paying from \$5 to \$10 a day to the man. They let a contract a short time ago for 300 feet on the main tunnel, and the

shareholders think that they have one of the finest paying claims in this section. The Union Consolidated of Happy Hollow is driving its tunnel ahead as fast as a Burleigh drill can do it, and at last report they were working 15 white men. The contractor, John Frisbee, expects to have his contract of 1500 feet completed about the first of September.

**DIVIDEND.**—*Mountain Messenger*, April 14: Bald Mt. Ex. Co., April 9th, declared dividend, No. 17, of five cents a share, aggregating \$3000.

**AT SIERRA CITY.**—*Cor. Mountain Messenger*, April 14: No. 9 tunnel, at the Sierra Buttes quartz mine, is in a distance of 8500 feet and still going ahead. A contract has been let to run the tunnel at the Parry Consolidated mine, 200 feet, to J. Perry, H. Rich and others. Two men have commenced work at Secret Mount and will run west on the ledge.

**YOUNG AMERICA.**—The mine looking first-rate in the several steps. No. 3 is also looming up in good shape, which makes the shareholders smile; and in general, the whole hill looks and works well under the management of the several officers.

## Siskiyou.

**QUARTZ AND PLACER.**—*Yreka Union*, April 14: Judge Shepard of San Francisco, who is at the head of the company working the Quartz Hill mine at Scott Bar, was in the city this week. We are informed that he has organized a new company to open a 40-foot ledge on the west side of Scott river, above Scott Bar. This ledge was first prospected by Dick H. H. H. Different capitalists have been after the Schroeder & Werner quartz mine on Deadwood, but the owners could not be induced to set a price on the property, not caring to sell. Last week, however, they were besieged harder than ever, and fixed the price at \$160,000. The silver ore discovery made by Perry Merwin at the headwaters of Trinity on Scott mountain has been relocated. Hon. R. H. Campbell's hydraulic mine in Quartz valley, from appearances, will yield this season not less than \$40,000. The new elevator keeps the six-foot flume full and is working satisfactorily. The electric lights are also working fine. The blasting charges, for caving down the deep banks, are set off by electricity. Heckatome's mine on Greenhorn is paying well. Every now and then a pocket is struck yielding from \$15 to \$700.

## Tuolumne.

**NOTES.**—*Sonora Democrat*, April 14: John Neal is moving his Huntington mill from the Tuolumne river to a place near Brown's Flat. The Longfellow mine, near Groveland, which in the past has yielded immense amounts of gold, is now being reworked, and the present management anticipate big developments. Messrs. Baulich & Mandich Bros. are getting some fine prospects in their mount in claim. Crossings are encountering the lead every foot or two, and the probability is that a pocket will soon be discovered. The Bonanza mine is continuously rewarding its owners by a generous yield of the precious metal. Mr. Harper, from San Jose, went up to the Green mine this week with a force of men to reopen that property. It is reported by good authority that the Young Tuolumne mine, discovered by Hubert Shaw on the Tuolumne river, seven or eight miles from Groveland, gives promise of becoming one of the greatest mines in this country. It runs nearly north and south, obliquely across the country rock, which is slate, and follows up a high mountain, bordering the river. It varies from 5 to 15 feet in width, and from ore in the tunnel piercing the lead at the base of the mountain the lode will pay handsomely. Mr. Alvinza Haywood of San Francisco was in Sonora last week, and went up to the Eureka Consolidated (Dead Horse and Eureka). It is thought that a 20-stamp mill will soon be erected, and with a view to obtaining water for the mill and hoisting works, a ditch of 8 or 10 miles in length is now being surveyed. It will connect with the Tuolumne ditch near Confidence. From good authority it is ascertained that water for hoisting purposes will be on the ground in at least two months. It is fast time, but the company mean business.

**RUMORED STRIKE.**—*Tuolumne Independent*, April 14: It is rumored, on the streets, that another big strike has been made in the Bonanza mine, in Sonora. We hear sums stated all the way from \$20,000 to \$80,000. As to the truth or falsity of the rumors, we know nothing, as those in interest have given us no information on the subject. Such matters if true, help the country; but still it is a matter of private business, and if the parties direct in interest do not care to volunteer the information, we do not know that it is our province to go around with a gimlet and bore into individuals to extract their business secrets to satisfy public curiosity, or even to benefit Tuolumne county. It rather strikes us, in fact, that men who take large amounts out of her soil owe her a great deal more than we do. We are always glad to publish facts, but when asserted facts, as in this case, run into wild speculation, we prefer to wait official returns. So far as the lessees of the mine are concerned, the higher the figures the better we shall be pleased at their good fortune.

## Yuba.

**DRY-WORKING GRAVEL.**—*Grass Valley Tidings*, April 13: A lease of a portion of the once famous Golden Gate hydraulic mine at Smartsville has been made to Gideon Frisbee of the New York machinery manufacturing firm of Frisbee & Lucop. Mr. Frisbee will place on the ground his plant—a late invention—for dry-working gravel. He proposes to commence the work right off. Should the process prove successful—and on its face it appears perfectly feasible—the cement-gravel deposits of Nevada county may again be profitably worked and without sending down debris to our valley brethren, thus restoring in a great measure the old-time prosperity of a score of villages and hamlets. Several parties of lessees are engaged in drifting on the Golden Gate channel and are doing well. Compton & Co. started up an arrastra on Friday, a Pelton water-wheel operating it. Another company of lessees this week got into gravel which yielded \$1 a pan.

## NEVADA.

## Wahoe District.

**BULLION.**—*Virginia Enterprise*, April 14: The winze is down 54 feet, and are now opening a station there to prospect the country at a depth of 640 feet.

**HALE AND NORCROSS.**—On the 400 level the

stopes are in fair-grade ore. On the 600 level are putting in square sets and have commenced stoping. The ore is high grade. From the 700 level are extracting the usual amount of excellent ore. During the week have hoisted 1518 tons of ore from these levels and have shipped to the Nevada and Mexican mills 1608 tons. Average battery assays, \$34.88 per ton. Have bullion on hand and previously shipped amounting to \$38,000.

**UTAH.**—On the 472 level from the top of No. 2 upraise have completed a station and advanced the west crosscut 25 feet; total distance from upraise, 44 feet. This crosscut has passed through the east clay wall, and the face is now in quartz and porphyry showing some value by assay.

**OCCIDENTAL.**—In the lower tunnel, 75 feet south of the north incline winze, the incline upraise has been carried up 13 feet; total, 25; and 150 feet south of the north incline winze the south drift has been extended 12 feet; total, 68. Have extracted 22 tons of fair-grade milling ore.

**BEST AND BELCHER.**—On the 425 level upraise No. 2, near the north line, has been carried up 28 feet; total, 86. The formation is clay and porphyry. The winze started at a point 50 feet south of upraise No. 2 has been sunk 16 feet. The formation is quartz carrying some value.

**CHALLENGE.**—The joint Challenge-Jacket north drift on the 1000 level is in a distance of 231 feet. Connection with the upraise was made last night, and now they will commence crosscutting east and west, having secured a good circulation of air.

**BALTIMORE.**—Are putting in a new pump of a capacity to handle 60 miners' inches of water. The work will be completed to-day or to-morrow, when work will be resumed in the north and northwest drifts on the 250 level.

**ALPHA AND EXCHEQUER.**—Are working on the 422 and 222 levels of Exchequer and on the 382 level of Alpha. Have started a winze 100 feet north of the Alpha shaft where there is a good prospect for ore.

**GOULD AND CURRY.**—Have extracted during the week 150 tons of ore from the 250 and 300 levels of fair-grade milling quality, which has been stored in drifts in the mine.

**CROWN POINT.**—The 400 level winze has not advanced since the last report, on account of the large amount of water it was necessary to bail. Will now raise from the 500 level to connect with it.

**SAVAGE.**—Are extracting ore from the several levels between the 400 and 900 stations, and are shipping to the Rock Point mill about 70 tons per day. Battery assays average \$32 per ton.

**CONFIDENCE.**—Are now shipping to the Brunswick mill for reduction 180 tons of ore daily, the average battery samples of which show over \$51 per ton.

**BELCHER.**—The 500 level south drift has advanced 25 feet; total length, 72 feet. The face is clay with streaks of quartz through it.

**KEYES.**—The south drift on the 240 level is in a very favorable formation with streaks of fine ore in the face.

**YELLOW JACKET.**—Are shipping 100 tons of gold-bearing rock daily to the Santago mill.

**HAYWOOD.**—Are drifting from the bottom of the winze 270 feet below the tunnel in ore.

**ALTA.**—Are hoisting sufficient ore from 825 and 1150 levels to keep the mill running.

**JUSTICE.**—All work has been temporarily suspended in this mine.

**OEST.**—Are working 15 men and milling rich ore at the Briggs mill.

## Aurora District.

**WILL RESUME OPERATIONS.**—*Esmeralda News*, April 14: Aurora, which in time past has yielded large quantities of the precious metal, appears to be taking on a new lease of life and will soon resume operations. It would not be surprising in the least to hear that 100 men were at work in the mines of Aurora.

## Eureka District.

**THE SILVER CONNOR MINE.**—*Eureka Sentinel*, April 14: The owners of the Silver Connor mine expect to ship about 200 tons per month during the coming summer. They have continued the tunnel through the ground purchased of Grif Thomas, and it is now in 300 feet to and through the ore body on the 300 level of the mine. Ten tons of ore were extracted from the tunnel in crosscutting the chamber, a distance of 20 feet. They will now raise to make connection with the old works. The distance will be about 25 feet, and it will be all the way in ore. The ore that has been taken out of the tunnel so far assays \$35 per ton, \$24 of which goes in gold, and it nets a handsome profit to the furnaces.

## Garfield District.

**PRODUCING BULLION.**—*Esmeralda News*, April 14: The Garfield mines, although not making a needless lot of noise, continue to employ the usual number of men, and their bullion shipment are as large as ever. There are numerous other bullion-producing mines in this county of which mention might be made, but the above named will suffice the purpose of this article.

## Hawthorne District.

**OPENING MINES.**—*Esmeralda News*, April 14: Hawthorne district, about which so much has lately been written, continues to furnish profitable employment for miners and prospectors. Very few men have gone into the district, with the intention of working, but what have been fully compensated for the time and labor expended, and in many cases, have cleared enough money—if properly cared for—from a few months' labor to make them comfortable for the rest of their days. Good mines are being continually opened up, and as soon as men of means can be made to understand the splendid opportunities for investment the district will boom as it never has. There is one thing which is absolutely necessary, and that is proper facilities for reducing the ores. There is low-grade ore enough on the dumps of the several mines, which cannot bear the expense of transportation, to keep a reduction works in constant operation for a period of at least five years.

## Silver King District.

**ORE.**—*Pioche Record*, April 11: D. McCarter came in Tuesday from Silver King district, where he

has been working for the past nine months. He states that he has taken out about 200 tons of ore, which he intends to sort down to 100 tons, and he thinks will average 200 ounces in silver per ton. Silver King district is about 25 miles from Bristol, in a westerly direction. Mr. McCarter thinks it worth staying with.

#### TUSCARORA DISTRICT.

**NORTH COMMONWEALTH.**—*Times-Review*, April 13: Work in the prospect shaft advanced 20 feet. New prospect shaft sunk 16 feet.

**NAVAJO QUEEN.**—North drift from west crosscut, 200-foot level, advanced 13 feet during the week. Rock turning much harder.

**BELLE ISLE.**—North drift on east lateral from east crosscut No. 1, 250-foot level, extended six feet. The rock in the face is somewhat harder.

**PONDERE.**—South drift from shaft No. 2 advanced six feet. Are extracting some good ore in this drift.

**NAVAJO.**—The stopes are yielding their usual amount and grade of ore.

**GRAND PRIZE.**—Upraise above the 300-foot level stopes extended up 17 feet; the ore continues and is high grade.

**FOUND TREASURE.**—Stope from chute No. 2 continues to yield the usual amount of high-grade ore. Southeast drift has advanced 10 feet.

**NORTH BELLE ISLE.**—North gangway, 400-foot level, extended 18 feet. The character of the rock remains much the same as at last report. North intermediate from No. 1 winze extended six feet, still in very rich ore. Started a stope north from the upraise and also another one 200 feet south on the vein from No. 3 crosscut, same level. The ore taken from the stopes just started is very high grade.

**NEVADA QUEEN.**—250-foot level: No. 1 west crosscut has been advanced 12 feet, and will break in to the ore in the next 24 hours; the ore cut further north is high grade and solid; assays, \$653 per ton. 350-foot level: East crosscut from north drift on east vein has been advanced 20 feet, cutting several seams of good ore. Upraise in the ore has been put up 12 feet; total, 48 feet. Ore taken from this point during the week has been very rich, showing heavy in ruby; top of raise is all in ore, looking as well as at any time since starting.

**COMMONWEALTH.**—150-foot level: South drift has been extended seven feet. Upraise from south drift has been extended up 19 feet, all in ore; work at this point has been stopped and ore chutes are being put in. No. 2 south drift has been advanced 18 feet; the formation is looking favorable for ore. North drift from bottom of winze has been advanced 23 feet in good ore, but not so rich as in intermediate drift above, but is improving every day; ore taken from this drift will mill \$200 per ton. The south intermediate drift has been advanced 10 feet in very high grade; assays average \$912 per ton, of which \$120 is gold; this drift shows very rich in face, both north and south.

#### ARIZONA.

**BRADSHAW DISTRICT.**—*Prescott Courier*, April 11: Crowned King, and Moody and Place mines, of Bradshaw district are remarkable for size and richness. N. C. Sheekles, who has had considerable to do with developing these mines during Mr. O. F. Place's absence, has a very high opinion of both mines. Latest assays of Crowned King ore were as follows: Gold, \$149.23; silver, \$2.54 per ton. A mill test gave \$70 per ton. They are the best developed mines in the county, being opened by tunnels, the combined length of which is fully 1300 feet. These mines are in slate format. Gold is increasing; silver diminishing. Company own a mill and 3 cars of machinery will be added right away. Contract for timber, fuel, etc., has been let. Mill will have every appliance for saving the metals. Wood and water are abundant. Papers for the sale to Chicago parties of three-fourths of the Senator mine were yesterday made by the present owners, Messrs. Hugo Richards and Geo. W. Bowers. Money will be paid to them in a few days. The purchasers will dry the mine, sink a new shaft and work the property in the right way. The other fourth belongs to Judge H. Brooks. James Allen, of Cherry district, is here feeling well on account of the good looks of mines in his camp.

#### COLORADO.

**BULLION KING.**—*Elk Mountain Pilot*, April 14: In the Bullion King mine, Supt. Repell has sunk a winze in No. 3 south level to connect with No. 4 level. The winze is about 500 feet from the main shaft, and further out than No. 4 level has been driven. The winze is in good ore all the way and gives evidence that the mine will have considerable ore to ship this summer. Matt Nicols came up from the Old Lot mine last week, and has gone to Irwin to get the Metzler concentrator in order to commence running. There is already 400 or 500 tons of ore on hand ready for operation, and the prospects are very flattering for a good summer's work.

**PROSPECTING.**—*Georgetown Courier*, April 13: The largest stockholders of the Lehanon Mining Co., the Republican Consolidated mines and the Centennial Co. have all been personally on the ground of their respective properties the past week. This is a most excellent feature of the new order of things, for if the heaviest investors will make their Colorado interests matters of personal concern they will be more fully convinced of the value of their mines and of the necessity of business management in their affairs. Hitherto resident managers have tried almost in vain to get shareholders to inspect the mines. Such visits will do a great deal of good to the county.

#### DAKOTA.

**MIDSUMMER.**—*Deadwood Pioneer*, April 10: Work goes steadily on at the Midsommer, with sufficient encouragement to warrant interested parties in believing a good-sized ore body will shortly be disclosed. Stringers and boulders of ore are constantly appearing in the shaft, while the formation through which the latter is passing is undergoing a gradual change. The placer season begins in about a week or ten days, and preparations are under way to work several bars on a scale more extensive than ever. Good reports are heard from the Pocobontas. The ore crevice on which a shaft was recently started is widening as depth is attained, while the quality of

the rock still maintains its previous high value. A report comes from the Seabury-Calkins that excellent ore has been found recently in a drift from the 160 level. Of what extent the strike is, our informant was unable or unwilling to state. The ore, however, is rich, and assays in bet 1 gold and silver.

#### IDAHO.

**NEW LODGE.**—Silver City *Avalanche*, April 9: Messrs. Bennett & Dupont have discovered a very rich lode above the old Whisky gulch lode in Whisky gulch. The lode was found where the water had washed the soil off the bedrock. The lode is probably the one that has thrown out rich float, for the discovery of which a great deal of work has been done. The gentlemen are to be congratulated on their rich find.

**ORO FINO.**—The Oro Fino group of mines is now being placed in condition to furnish ore for a go-stamp mill the year around. The tunnel or drift on the Sinker is being driven south rapidly, showing a well-defined lode of fair-milling ore. Levels that have been filled with water and slum for years are being cleaned out, and altogether things present a lively appearance about the mine. Our camp has not had a brighter outlook for years, and it is safe to predict that the Oro Fino group of mines will produce a large amount of money this year.

**SURPRISINGLY RICH ORE.**—*Wood River Times*, April 11: Some time ago some of the Mayflower leasers, despairing of making expenses, concluded to throw up their lease, and began putting things in order preparatory to doing so. In cleaning up the drift they gathered about a ton of first-class ore and somewhat more of second-class. This first-class ore they thought might just about pay their board bill, while the second-class was not worth shipping. They therefore sent the first-class ore to the Hailey Sampling Works, when, much to their astonishment, it assayed 999 ounces in silver and 42 to 43 per cent in lead. They thereupon screened their second-class stuff and sent it down, when it was assayed and found to carry over 500 ounces silver to the ton! The boys went to work again, expecting to do well.

#### MONTANA.

**THE GREAT FALLS SMELTER.**—*Great Falls Tribune*: The mammoth works for reducing and refining gold and silver ores, now in process of construction at Great Falls, will be the largest and best equipped in the world. They will be built in four sections, each complete in itself. The first will be in full running order by Oct 1st of this year. Work upon the second will be commenced at that time, while the former is in operation. Such will be the order of procedure until the entire plant is completed, involving an expenditure of over \$2,000,000. Some idea of the magnitude of this great work may be had from the following description of one section: Number of blast furnaces, 5; number of roast furnaces, 20; amount of building brick, 6,000,000; amount of fire-brick, 600,000; capacity per day (tons of ore), 200; number of cars per day (for transportation), 50; men employed in construction, 500; men employed in operating, 250. The blast-furnace building will be 168 by 100 feet. The roast-furnace building will be 408 by 100 feet. The sampling works will be 150 by 100 feet. The engine-house will be 150 by 85 feet. One smokestack will be 32 feet square at the base; 150 feet high and 12 feet square at the top. Another smokestack will be 28 feet square at the base, 125 feet high with a 10-foot square flue.

#### NEW MEXICO.

**PRODUCTION OF SOCORRO COUNTY FOR 1887.**—*Socorro Bulletin*, April 7: The Rio Grande Smelting Co. is now engaged in adding a fourth stack; it will have a greater capacity than any of the other three. It will be 3½ x 10 feet at the tuyeres, also flue-dust catchers and condensers. The building will be very materially enlarged, and another engine of 100-horse power is now upon the way. Other improvements and adjuncts will very materially improve and enlarge this well-known plant. *En passant*, it is not inopportune to inform our readers that the product of this plant for the year 1887 amounted in dollars and cents to the following sum, which will be very largely increased this current year: Silver, 1,112,453.47 ozs., @ 98 cts., \$1,090,204.40; lead, 10,340,085 lbs., @ \$4.75, \$49,154.04; gold, 3924.569 ozs., @ \$20, \$81,120.24; total, \$1,669,479.28.

**GRAPHIC MINING AND SMELTING COMPANY.**—We understand that the Graphic Mining & Smelting Co. is meditating a considerable modification of its smelting plant and an increase of capacity. During the year 1887 it produced the following amount of bullion: Lead, 4,305,296 lbs., \$189,726; silver, 200,399.24 ozs., \$201,724.49; gold, 604.46 ozs., \$12,149.36; total, \$403,599.85.

#### OREGON.

**THE CHLORIDE MINE.**—*Bedrock Democrat*, April 10: Prominent among the first-class mining properties of Baker county may be ranked the Chloride, situated about 21 miles northwest of this city and about seven miles from Haines, its nearest point on the O. R. & N. road. The mine is owned, and is now being developed, by the Chloride Consolidated M. Co. Six men are now employed on an eight-hour shift. There now remains but 50 feet more tunneling to complete a 900-foot contract, after which the company will sink an incline on the ledge in a tunnel as deep as possible, to make it probably 100 feet. Having done this, it is their intention to crosscut in several places with a view of ascertaining the width of the ledge. The present yield of ore is high-grade milling, much of it being splendid shipping ore which will be sent to Denver for reduction.

**GRAVEL MINES.**—*Bedrock Democrat*, April 10: The gravel mines of the north fork of the John Day, Grant county, have been noted for many years for their extreme richness, and their gold output annually has been enormous. The mines are situated on the bars or banks of the John Day river, a rapidly flowing stream having its source in the Blue mountains and emptying into the mighty Columbia, hundreds of miles distant. The gravel mines in question have been worked more or less since 1862, and this spring several companies have commenced operations.

### List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, \$20 Market St., S. F.

FOR WEEK ENDING APRIL 10, 1888.

380,843.—**ORE PULVERIZER**—Baratini & Stevenson, Murphys, Cal.  
380,744.—**TWO-WHEELED VEHICLE**—K. A. Brigham, Gilroy, Cal.  
380,745.—**SPECULUM**—P. Chamberlin, Santa Cruz, Cal.  
381,059.—**METALLIC RAILWAY TIE**—W. H. Donaldson, S. F.  
380,888.—**STEAM-ACTUATED VALVE**—W. W. Hanson, S. F.  
380,895.—**GANG PLOW**—H. M. Irwin, Hanford, Cal.  
R. 10,921.—**FLOOR, ROOF OR AREA COVERING**—P. H. Jackson, S. F.  
380,782.—**SHOWCASE**—Chas. F. McGlashan, Truckee, Cal.  
380,918.—**ENGINE INDICATOR ATTACHMENT**—J. R. Mitchell, Oakland, Cal.  
380,763.—**FRUIT LADDER**—M. H. Murphy, Portland, Oregon.  
380,820.—**PRESERVING SUBMERGED TIMBERS**—H. L. Ricks, Eureka, Cal.  
380,821.—**CRUSHING-MILL**—A. E. Roe, S. F.  
381,032.—**CABLE GRIP**—A. E. Roe, S. F.  
380,700.—**DENTIFRICE**—J. Schwartz, Portland, Oregon.  
380,774.—**FEEDER FOR CAN-BODY MACHINES**—Jos. Stevens, S. F.  
380,831.—**CASH REGISTER**—E. T. Taylor, Oakland, Cal.  
380,840.—**HORSE-POWER PUMP**—H. D. White, Cottonwood, Cal.  
380,842.—**APPARATUS FOR EXAMINING ORES**—Williamson & Hickies, Oakland, Cal.  
Norm.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

#### Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

**CRUSHING-MILL.**—Alpheus E. Roe, assignor to Tatum & Bowen, S. F. No. 380,821. Dated April 10, 1888. This ore-mill we have previously described. It consists of two or more heavy weights having a series of stamps fitted into their lower convex faces, and dies upon which these stamps operate, together with a mechanism whereby the two series of oscillating stamps may be caused to move in opposite directions within the same mortar. Tatum & Bowen are manufacturing and selling these mills, which are found to be very effective.

**STEAM-ACTUATED VALVE.**—W. W. Hanson, S. F. No. 380,888. Dated April 10, 1888.

This invention of the late Mr. Hanson, who was quite an ingenious inventor, relates to certain improvements in direct acting engines such as are usually employed for actuating pumps and similar reciprocating apparatus. It consists in such a construction and arrangement of the parts as will greatly simplify them and facilitate access to the working parts, so that they may be adjusted or inspected by simply removing a single cover or plate. By constructing the main valve in the B form and the auxiliary in the D form, the auxiliary piston has its movement in the same direction as that of the main piston, and the inventor was thus enabled to dispense with all the reverse motions for the auxiliary piston, and devices for producing it, thus reducing the number of parts outside of the cylinders, and the chest to a single tappet-arm in the main piston-rod and the two tappets on the auxiliary piston-rod. This does away with all sliding joints and decreases the wear of outside valve-motion and the necessity of the frequent adjustment of the same.

**CABLE-RAILROAD GRIP.**—Alpheus E. Roe, assignor of one-half to John H. Bolles, S. F. No. 381,032. Dated April 10, 1888. This mechanism is an improved one for connecting cars with an endless traveling cable which moves in a tube beneath the roadway. It consists of short endless chains passing around rollers which are journaled upon a frame depending from the car, and so placed that one of the chains will stand above and the other below the cable. In combination with these is a mechanism by which the cable is gripped between the chains or released therefrom for the purpose of starting or stopping the car, and a mechanism by which the lower grip may be thrown to one side to release it from the cable. With this grip the car may be returned from the end of this line without being reversed.

**FLOOR, ROOF OR AREA COVERING.**—Peter H. Jackson, S. F. No. 10,921 (re-issue). Dated April 10, 1888. This invention relates to certain improvements in fire-proof floors, roofs, pavements or area-coverings. It consists of a surface of artificial stone or concrete, either with or without glass set therein for illumination. In a previous patent the inventor shows metallic supporting beams which extend outward from the building, and are fitted to support the ends of the corrugated plates or plates that extend between the beams. These corrugations, which form the strengthening plate,

extend across between beams and parallel with the building front, the corrugated plates supporting a filling of artificial stone or concrete, the top of which forms the pavement or surface. These plates are usually perforated to receive thick glass which serves to light the basement or area beneath. In practice, Mr. Jackson finds that the corrugations which extend parallel with the building front, and which are of considerable depth to provide the necessary strength of plate, will cut off the light from the glass which is fitted into the plates so that it will not be thrown back into the basement as far as it should on account of the depth of the ribs or corrugations. The object of this present invention is to so construct the roof or covering that the light will not be cut off. The improved plates are placed so that the ribs or corrugations extend outwardly or at right angles from the front of the building so the ribs will not obstruct the light.

**SPECULUM.**—Philander Chamberlin, Santa Cruz, No. 380,745. Dated April 10, 1888. This invention relates to that class of surgical instruments termed "specula," and the invention consists in the combination of the annular hub, the spring-actuated arms pivoted to said hub, and the annular nut operating in the hub, and against the spring arms whereby they are expanded. This improved instrument is of simple construction and effective operation.

**TWO-WHEELED VEHICLE.**—Kasson A. Brigham, Gilroy, Santa Clara county. No. 380,744. Dated April 10, 1888. This is one of the class of vehicles commonly known as carts. The invention consists in the combination of an independently movable body, a peculiarly divided or sectional shaft, and a novel connection between the body and one of the sections of the shaft. This object is to provide for the independence of the body of the cart and the jointing of the shaft, and by a novel connection between the two produce this perfect result of overcoming the motion due to the joggling of this horse.

**STEAM ENGINE INDICATOR ATTACHMENT.**—Joseph R. Mitchell, Oakland. No. 380,918. Dated April 10, 1888.

The invention consists, broadly, in a novel connection with the card-bearing cylinder of the indicator, whereby the limits of oscillation of said cylinder are shifted to provide for consecutive separate diagrams on the indicator card, and, further, in such a connection as will effect said shifting at the time when the pencil describing the diagram is moving upon the exhaust line, or line parallel to the atmospheric line, whereby any distortion of the diagram is prevented. The invention consists, particularly, in a card for effecting the usual partial rotation of the cylinder, and which is so connected as to alter its length, whereby the cylinder is given or allowed to have an additional movement to vary the position of the diagrams on the card, and, finally, in the novel connection of the card, whereby its length is automatically altered. The invention has for its separate object the making of distinct and separate consecutive diagrams on the same card.

**ORE PULVERIZER.**—David Baratini, Murphys, and Wm. P. Stevenson, Douglas Flat, Calaveras county. No. 380,843. Dated April 10, 1888. This is one of that class of ore pulverizers or rock crushers in which a rolling weight operates within a rocking mortar. The rocking mortar is made with a convex inside surface, and through its center projects downwardly and upwardly a pin, the lower portion of which is fitted loosely in a socket in the bed plate, and the upper portion passes into a socket in the rolling weight. By means of this pin the parts are held in proper position, being steady even under rapid movement. The pin prevents the roller weight getting out of place. The roller weight is operated by a pitman in the ordinary manner.

**METALLIC RAILWAY TIE.**—Walter H. Donaldson, assignor of one-half to Robert H. Reid, S. F. No. 381,059. Dated April 10, 1888. The object of this invention is to provide a strong and stiff tie or sleeper and means for securing the rails thereto, which obviates the necessity of spikes and bolts, said means also providing for fixing the gauges with precision. The fastenings consist of two dogs or hooks. The tie is made of rolled or cast metal and consists of a top plate with outwardly beveled flanges and a longitudinal central or T web. The top flanges and web are perforated with rectangular slots for the reception of the wedges, and the dogs or clamps. Transverse wedges through the tie act on the lower ends of the dogs and cause their upper ends to clamp the rails.

**GANG PLOW.**—Hall M. Irwin, Hanford, Tulare Co. No. 380,895. Dated April 10, 1888. The improvement consists in the novel construction of the running surfaces or rims of the inclined wheels of the plow. The object is to steady and guide the plow by so constructing the rims or running surfaces of the inclined wheels that they shall present a broad surface squarely to the ground, and a surface squarely to the land side of the furrow previously made. By dispensing with the land sides of the plow bottoms, the friction is avoided, and by having the rims of the inclined wheels squarely on the ground the friction is avoided which usually occurs when using the ordinary inclined wheels of the plows of this class. The topline, which has heretofore been necessary to steady plows with inclined wheels, is also dispensed with.

— THE —  
**DOUBLE "ECONOMIC" STAMP MILL.**

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

**AN AUTOMATIC ORE FEEDER**  
Goes with each Mill. We also have a suitable  
**Rock Breaker.**

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

**TATUM & BOWEN,**  
34 and 36 FREMONT STREET, SAN FRANCISCO, CAL.  
Manufacturers of Mining and Sawmill Machinery, Engines, Boilers, Etc.

**THE RAND DRILL COMPANY,**  
23 PARK PLACE, NEW YORK,

Are now so situated with their new works as to offer to the miners of the Pacific Coast small Air Compressing Plants at such prices that almost any small mine can afford to put in power drills if they have none in use.

By their new and patented systems (by which the duty or performance of drills is not reduced with use) it is no longer necessary to buy a Compressor of double capacity than the drills are expected to require, in order to keep up the supply of air necessary on account of the wear of drills and compressor.

Besides having the newest and lightest designed small drill plants, the Rand Drill Company, as is well known, has built, and is now building, the largest Compressor plants in this country, and has patterns for all sizes up to 40-inch diameter of cylinder.

In respect to capacity in speed of drilling, perhaps it is in order to say that in every authoritative contest for speed yet initiated, the Rand Drills have, without exception, been victorious. This fact, coupled with another important one, that the drills use much less air and cause less repairs, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained them from the California market no longer exist, they are now in the field for the business.

**SPECIAL ATTENTION** is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor now being built for the Anaconda mine in Montana.

**THE GIANT POWDER COMPANY**  
Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as  
**The Safest and Strongest High Explosives in the Market.**  
**GIANT POWDER or DYNAMITE,**  
Of Different Strengths as Required.  
NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and  
GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

**JUDSON POWDER IMPROVED.**  
**FOR RAILROADS AND LAND CLEARING.** Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

FROM 2 TO 100 H. P., ALWAYS IN STOCK

**MILL SUPPLIES AND LUBRICATING OILS.**

**FRISBEE WET MILL.**

This Mill, with a weight of less than 9000 pounds, has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

**IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,**  
And renewals will not cost over one-half as much as for stamps. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.  
OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

**FRISBEE-LUCOP MILL COMPANY,**  
GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco.  
HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

**STURTEVANT MILL.**

This Mill as a Crusher and Pulverizer is without rival.  
Is in operation in each of the following smelting works and mills.

### Mining Share Market.

There is little new to report concerning mining stocks. The Reform Committee of the San Francisco Stock Board, appointed not long since, has done nothing, and the movement is at an end. On Wednesday, when the board assembled in executive session, it was determined to bring the matter to a crisis. Mr. Marve accordingly presented a resolution, which would test the disposition of the board and govern the future of the committee. It referred to the proxy system; was temperate in tone and carefully worded with regard to the insertion of any clauses which might state in dictatorial terms in the ear of the majorities in power. The power of the board to run its own business and protect its clientele was referred to incidentally in a mild preamble. The resolution was seconded by Coll Deane, and thereupon passed to a vote, which was lost by a small majority. The committee then resigned, and were awarded a vote of thanks for their services in the board.

The Virginia Enterprise says: Very few of our mining men pretend to explain the cause of falling values in stocks. Some claim that a great deal of money is now locked up in land speculation, and men will have to go through the process of breaking their financial necks and changing fortunes before there will be any great revival in mining-stock speculation. Others claim that there is a general belief that stocks will go lower, and they are dumping their shares on the market in the hope of getting in at lower figures, and thereby forcing many others to sell, because they have no money to make their margins good.

### New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department No. 1, San Francisco:

VALLECITO M. Co., April 17. Capital stock, \$1,200,000, in 60,000 shares. Directors—C. H. Livingston, T. B. Bishop, Sarah Mitchell, L. M. Hoeffer and H. R. White.

SISSON, CROCKER & CO., April 17. Object, to carry on a general merchandise and real estate business throughout the Pacific Coast. Capital stock, \$200,000. Directors—Albert W. Sisson, Clark W. Crocker, Samuel W. Cutter, Milo A. Burke and George W. Scott.

PACIFIC COLD STORAGE CO., April 17. Capital stock, \$100,000. Directors—W. H. Crocker, C. de Guigner, John Parrott, E. A. Rix and John E. de Ruyter.

GOLDEN GATE BUILDING ASSOCIATION, April 18. Object, to purchase land in this city and erect a building thereon for Golden Gate Commandery, No. 16, Knights Templar, and other organizations, lodges and societies. Capital stock, \$100,000. Directors—Frank Dalton, Frank W. Sumner, James H. Jennings, A. H. Vail, R. F. Osborn, Frank G. French, J. Z. Davis, H. J. Sadler, S. H. Seymour, William O. Gould and A. G. Booth.

SECURITY LOAN ASSOCIATION, April 18. Capital stock, \$1,000,000. Directors—William C. Hilderbrandt, Albert Abrams, Max Walter, Nathan Crocker, L. Lehenbaum, Gabriel Cohn, Manheim Marks and S. O. Alexander.

### Bullion Shipments.

We quote since our last, and shall be pleased to receive their reports:

Confidence, April 15, \$15,163—total for April thus far, \$93,237; Savage, 15, \$7500; Mount Diablo, 15, \$8187; North Belle Isle, 14, \$40,000; Germania, 11, \$3383; Hanauer, 11, \$1750; Queen of the Hills, 12, \$2220; Hanauer, 12, \$1830; Cons. California and Virginia, 17, \$59,030—April to date, \$110,000.

### Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JOHN G. H. LANFADUS—San Barbara Co.  
G. W. INGLE—Arizona Territory.  
W. M. WILKINSON—Fresno Co.  
A. J. FEWITT—Tulare Co.  
C. E. WILLIAMS—Yuba and Sutter Co.'s.  
R. G. HUSTON—Montana Territory.  
E. H. SCHAEFFER—Sacramento Co.  
F. B. LOGAN—San Diego Co.

A FORTUNE IN IT.—It is only once in a life-time that prospectors and miners who do the hard pioneer work have a chance to make a fortune. They are advised to consider well some information in this number of the PRESS "On Milling Ores." If interested, address J. A. Johnson, 307 Montgomery street, San Francisco.

J. A. JOHNSON, 307 Montgomery street (the Nevada Bank building) is the general agent of the Stiles quartz machinery, and offers easy terms for introduction.

### "On Milling Ores."

The Stiles quartz-mills and concentrators are now on the market. Special terms are offered for introduction. The hand-mill, which will reduce one ton in 24 hours by hand-power, is a model of the larger mills and is a true ore granulator. The five-ton mill can be run with one-horse power. The 10, 20, and 30 ton mills, with proportionate power. The hand-mill weighs only 450 pounds, and the 10-ton mill but 1000 pounds. The prices range from \$250 to \$900. Concentrators at the same prices. Send for circulars. Address J. A. Johnson, general agent, 307 Montgomery St., S. F., Cal., Nevada Bank building.

PREJUDICE rules the opinions of most men. One in a thousand dares to do his own thinking. The Stiles quartz machinery appeals to the thinker. J. A. Johnson, 307 Montgomery street, is the general agent.

### Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

"ON MILLING ORES."—Address J. A. Johnson, 307 Montgomery street, San Francisco.

### ASSESSMENT NOTICE.

Butte Creek Hydraulic Mining Company.  
Location of principal place of business, San Francisco, California. Location of Works, Butte county, Cal.  
NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 27th day of March, 1888, an assessment (No. 12) of five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary at the office of the company, No. 213 Market street, San Francisco, Cal. Any stock upon which this assessment had remain unpaid on the 7th day of May, 1888, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Monday, the 25th day of May, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.  
LOUIS A. LEVY, Secretary.  
OFFICE—No. 213 Market street, San Francisco, Cal.

Blacksmith's Cold Chisel, 1 1/2 lbs. Steel.

Blacksmith's Drill Press, 50 lbs.

Blacksmith's Hand Feed, 14 lbs. Steel.

### THE FOOS MFG. CO., Springfield, Ohio.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

## It is a Novelty.

It is a novelty, for there is no other mill like the Stiles granulator quartz-mill. It is a rotary of almost unlimited power, and cannot be broken even at a thousand revolutions a minute with gads or pick-points run through it, while it may be run empty all day unharmed and unworn. It is the lightest, cheapest, safest, easiest running quartz-mill in the world, and does not require an experienced millman to run it. Office in Nevada Bank building, 307 Montgomery street, San Francisco. J. A. Johnson, general agent.

## THE PELTON WATER WHEEL

Gives the highest efficiency of any wheel in the world and is everywhere recognized as the standard for high pressure service.

## UPWARDS OF 500 IN USE.

From 12 to 20 per cent better results guaranteed than can be produced from any other wheel in the country. It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Hoisting, Pumping, or any other purpose where water power can be used.

## ELECTRICAL TRANSMISSION.

Power from these wheels can be transmitted by electricity several miles with small loss, and made available for running Mills, Pumping and Hoisting Works, Trams, etc. Address

The Pelton Water Wheel Co.,  
127 FIRST ST., SAN FRANCISCO, CAL.

## ELECTRIC DEVELOPMENT COMPANY.

## Incandescent &amp; Arc Electric Lights.

Electric Motors, Dynamos, Trams, Elevators, Signals and all kinds of Electrical Systems for lighting and transmission of power, either direct or with storage Batteries.

## For Mines, Hoisting Works, Mills, Reduction Works,

Indoor and Outdoor Illumination of every kind. Gas, Oil and Candles superseded by the

## EDISON INCANDESCENT LIGHT,

The only complete and satisfactory incandescent system. Lights require no attention and are under complete control. Over 500,000 lights in use in the United States. SELF-REGULATING ARC LIGHTS turn night into day and afford a means of working the whole 24 hours; invaluable to contractors and others to whom time is an object. Estimates and designs on application.

Offices and Showrooms, 323 PINE ST., SAN FRANCISCO.

## IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS, with lever attachment, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under a decision of Sawyer, Judge of the U. S. Circuit Court, in the case of Hendy and Fisher vs. R. Hoskin & Co.

We also manufacture the Single-Jointed Giants.

Prices and Catalogues of Hydraulic Mining Machinery furnished upon application.

JOSHUA HENDY MACHINE WORKS,  
39 to 51 Fremont St., San Francisco, Cal.

This cut represents our

IMPROVED

HYDRAULIC  
MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

HOSKIN & CO., Marysville, Cal.

Send for Circulars and Price List

## THE ROLLER ORE FEEDER

(Patented May 28, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under men or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works.  
Sole Manufacturers.  
227 First Street, San Francisco, Cal.

## HORACE D. RANLETT,

Ores, Mining, and Commission,

420 Montgomery St., S. F.

BUSINESS MANAGER OF

UNION COPPER MINE, Calaveras Co.,

NEWTON COPPER MINE, Amador Co.

Correspondent as Agent for Smelters in London, Liverpool, New York, Boston and Baltimore.

Twenty years experience, in California, purchasing Ores and dealing in Mines.

Special attention given to management and sales of mines and purchase and shipment of copper produce.

## INVENTORS, TAKE NOTICE!

L. PETERSON, MODEL MAKER,

258 Market St., N. E. cor. Front (upstairs), San Francisco.  
Experimental machinery and all kinds of metal, tin, copper and brass

## JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

## "HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. O. WICKHAM, Taylor Mine, Greenwood, Cal.  
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.  
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

WE ARE MANUFACTURERS OF THE

## "CHALLENGE," "STANFORD," "TULLOCK," &amp; "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

## CALIFORNIA VIGORIT POWDER CO.,

No. 40 California Street, San Francisco,

—MANUFACTURERS OF—

## NITRO-GLYCERINE

("DYNAMITE" or "GIANT")

## Blasting Powders.

Vigorit "LOW" Powder,

FOR REMOVING STUMPS AND TREES,  
HAS NO EQUAL.

WORKS: California City, Marin Co., Cal.

ED. G. LUKENS, Manager.

## SQUARE FLAX PACKING,

Manufactured from strictly first-class Flax and pure lubricants. Superior to all others for Water and Steam. Packs with less friction and makes a tighter joint than any other packing made. Limitations of inferior quality having been put upon the market, we have been compelled to adopt the above trade-mark, and all of our packing will now have a RED CORD running through the center its entire length. See that you get it and take no other. Sold by all Hardware dealers. Price, 50 cents per pound. W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market St., San Francisco, Cal.

## Calvin Brown.

### Record of an Eminent Engineer.

Calvin Brown, whose portrait is given on this page, is an engineer of very large and varied experience. He is well known on this coast, where he has followed his profession for many years. Mr. Brown was born at Roxbury, Mass., in 1816, and was educated at the Roxbury Grammar school. His engineering instinct was manifested when a schoolboy, in the utilization of a small stream of water running through his father's premises for miniature water-wheels, trip-hammers, spinning machinery, etc. On this little stream he built the first of the many dams he has constructed.

When nearly 18 years old, he entered the engineering and patent office of R. H. Eddy of Boston, where he remained three years. Here he was employed on surveys for supplying that city with water, in the land surveys for the purchase of the site for the City of Manchester, N. H., and the location of the canals for the proposed factories of that place. At the age of 21, he was selected for the engineer of the Manchester Corporation, but declined the position, considering himself wanting in necessary experience. During the whole time of his service with Mr. Eddy, he was constantly employed and had charge of the location of the streets, docks and city lots of East Boston.

After leaving Mr. Eddy, he engaged in the engineering office of James Hayward, Esq., formerly Professor of Mathematics at Harvard University. While here and with S. M. Felton, C. E., he had charge of the hydraulic surveys and experiments required for the determination of the great lawsuit between the Boston Water-Power Co. and the Boston Iron Co. This service occupied many months and was performed under a commission of scientific and legal men, consisting of Mr. Hayward, Col. Leammi Baldwin, an eminent civil engineer who constructed the first granite drydocks in America, and Leverett Saltonstall, a distinguished lawyer. In this work, Mr. Brown enjoyed and improved a rare practical opportunity for the investigation of hydraulics. Upon the termination of this commission, he entered upon the practice of railroad surveys, location and construction, his first extensive experience of this kind being in the Southern States.

After this he was employed in ocean hydrography and surveys for the location and construction of lighthouses and beacons, under the direction of Capt. Alexander Parris, architect and civil engineer. It was under this gentleman, who at the time had charge of the engineering works at the Boston and Portsmouth, N. H., navy-yards, that Mr. Brown was employed as his assistant at the latter station, the especial occasion being the rebuilding of a large, deep-water granite wharf, which had been overthrown in consequence of faulty construction. He remained, however, but a short time in this subordinate position. Capt. Parris, after his completion of a new design for the remedy of the original wharf's destruction and the establishment of a system for the execution of the work, left Mr. Brown in charge, who then, at the age of 24 years, was appointed chief engineer of all his professional works at this station, which position he filled five years.

In this interim of time he constructed a line of solid masonry quay wall of about 1000 linear feet, much of which was in water of over 40

feet in depth, and upon a foundation of sloping rock, requiring frequent blasting for the footing of the outer courses of the stone work. This was the first occasion in the United States for the application of electricity or galvanism for blasting under water, and for the use of the diving bell for laying regular coursed masonry upon a large scale in such deep water.

Resigning from the naval service in 1845,

south of Dover street of that city. This firm of Brown & Hastings was employed by the U. S. Government in the machinery designs for the Memphis ropewalk, and in various other works in the naval service, as well as in several large private establishments, railroads, etc. Among the assistants employed by the partners was M. Carpenter, who subsequently became a distinguished U. S. Senator, and Zerah Colburn,

foundation the reverse of that upon which the Portsmouth wall was built. The difficulty of this problem, in order that its solution might be effected with the utmost economy, called for a somewhat peculiar design both in form of structure and execution, and Mr. Brown asked for a commission of engineers which should consider and judge of its merits. It was approved and the work commenced, and for nearly nine years continued under his direction. Other large works, such as the erection of a national foundry, boiler-shop, ordnance establishment, etc., at this yard were also in this interim designed and erected by him.

In 1861 Mr. Brown was detached from the Norfolk Yard and ordered to that at Mare Island in this State, where he has remained ever since. Besides his service on Government works, he has been extensively engaged in more private enterprises, both in railroad and canal surveys, and in the construction of water works. He built the first large dam for the Spring Valley Company, and designed and located the ship canal and locks at the Willamette Falls in Oregon. For several years he was one of the Government commissioners for the inspection of the Pacific railroad, and wrote the final report upon which the California system as then constructed was accepted. He is now retired from the naval service, and is engaged in several private corporation enterprises as consulting engineer, for which his large experience makes him competent.

**GOVERNOR WATERMAN'S MINE.**—Judge Sawyer has made a final decree in accordance with an opinion previously rendered, awarding nearly one-third of the celebrated Waterman mine to Ahhie L. Waterman, together with a proportion of the profits. The plaintiff is the widow of Governor Waterman's brother, and the suit was brought to enforce an agreement to convey an interest in the mine in consideration of money advanced to develop it.

**DURING** the month of March there was worked at the Nevada mill, for account of the Potosi Mining Co., 1550 tons of ore, yielding hullion of the gross value of \$33,242.91. The cost of reduction was \$10,850, and the net proceeds in hullion amounted to \$22,392.91. The assay value of the ore per ton was \$23.86. The gross average yield in hullion per ton was \$21.45, and the net average per ton was \$14.45.

**EUREKA AND RICHMOND.**—The long-pending suit between the Richmond Mining Co. and the Eureka Con. Mining Co., growing out of the alleged infringement of the first-named company's patents for working speiss, has been compromised and settled. By the settlement the Eureka Con. Co. has acquired a full and complete license to use the patents.

**THE MONTANA Co.** find that by the introduction of Frue vanners in their 10 and 50 stamp mills for the concentration of pulp before pan amalgamation they gain important advantages. By their means concentrates amounting to \$387,314 were recovered in one year which would otherwise have been mostly lost in the tailings. The vanners cost \$16,150.

**WM. IRELAN, JR.,** State Mineralogist, C. H. Aaron and W. A. Goodysar, all of the State Mining Bureau, have gone to the southern part of the State. They will commence field work in San Diego county.

CALVIN BROWN.

Mr. Brown re-entered upon railroad work, which he followed some years, afterward becoming engaged upon designs for turbine water-wheels, and upon their tests of efficiency in the factories at Lowell, Mass. Being now established in an office of his own in copartnership with Chas. Hastings, a former assistant of his, and with a corps of draughtsmen and fieldsmen, he became concerned in general engineering works, having personal charge of the construction of masonry piers, docks, and filling in of a large tract of the South bay for the City of Boston, and also of the grading of the streets

a Yankee boy, who afterward succeeded to the principal editorship of *Engineering*, a prominent London publication.

In 1850 Mr. Brown was called to the building of a railroad in a distant State, and thus left Boston. Completing his engagement with the R. R. Co., he was reappointed in the naval service to take charge of the engineering works at the Norfolk Navy Yard. Here he was called upon to renew his submarine experience at Portsmouth, N. H., in the construction of a line of heavy masonry quay wall, requiring to be erected upon a deep substratum of mud, a

## CORRESPONDENCE.

We admit, unadvised, opinions of correspondents.—Eds.

## A Reply From Mr. Patton.

EDITORS PRESS:—In a late number of your valuable paper I find the inclosed slip, which, as it contains several mistakes and misrepresentations, I return to you for correction, knowing your desire to publish the truth in such matters, and that you would not knowingly do me an injustice. In the first place, I have ordered no machinery from England. One set of ore-dressing machinery (a duplicate of that used at the Lake Superior mines for dressing copper ore) was ordered from Messrs. Fraser & Chalmers of Chicago as a pattern, they having built that at Lake Superior. The iron works in Australia are able to do all the work required, provided they are furnished with the necessary plans of same. As an employee of a colonial mining company I could not, in justice to them, import machinery that they can manufacture themselves.

As a matter of information to San Francisco foundries, I will state that the iron works here are furnishing castings for £9 (\$45) per ton of 2240 pounds, and finished work at the rate of £19 per long ton for cast and £22 for wrought-iron work. That portion of the communication relating to my reputation as an engineer is hardly worthy of notice. Those who know me best have blamed me for not claiming more credit than I have received for my work. As the machinery spoken of was designed and erected from 8 to 12 years ago, it would appear singular to an unbiased mind that the fact of my not being the author of my own work has just been discovered, and significant that this discovery was made immediately after my departure for the Antipodes. With many apologies for troubling you in this matter, I remain,

Yours truly,

W. H. PATTON

Broken Hill Proprietary Co., Broken Hill, N. S. W.

[The article referred to by Mr. Patton was published in the PRESS of Jan. 28, 1888, page 52, under the heading of "California Mining Machinery." It referred to the published statements of English officials having recommended American mining machinery, and to Mr. Patton (recently from Nevada) having recommended the purchase of English concentrating machinery for Australia. Some remarks were also made to the effect that the credit of designing some of the Comstock machinery was due to others as well as Mr. Patton, although his name alone had been connected with it. It was really a little "grumble" at Mr. Patton for not ordering machinery from San Francisco instead of getting it in England, when he knew how skillful our mechanics are in this line. It seems, however, that the article was based on false premises, as from what Mr. Patton says, it is evident he had not ordered any machinery from England, as the newspapers in Australia led people to suppose.—Eds. PRESS.]

## Gloster, Montana.

EDITORS PRESS:—This mine, that has so long been a steady worker, was compelled to close down their plant the first of the year, and they are now at work with a small force sinking, as their upper levels are exhausted.

From appearances they must have neglected their opportunities for purchasing neighboring properties, as they have worked up to their line on end next to the Diegan, an extension of the Gloster, and now cannot make terms with the owners. Hereafter has it that they could have purchased this property at a very low figure at one time, but would not have it at any price. Now \$150,000 is asked for it, which they claim is more than it is worth. Just now they have their 60-stamp plant lying idle in consequence of not being able to supply it with ore. If the ledge is worth anything now it surely would have been policy to have purchased it when offered at a low figure. H.

## The Jay Gould District.

EDITORS PRESS:—This name alone is a synonym of money, and the district thus named lies 20 miles northwest of Marysville, M. T., and this mine is now the only producer in the camp. It is a gold lead and pretty high grade, as they only have a 10 stamp mill on it and have been producing during the past few months from \$30,000 to \$40,000 per month. They have already paid over \$111,000 in dividends to their stockholders. There is none of this stock on the market, the owners being satisfied that they have a good thing with dividends regularly paid.

There are a number of other prospects in the same vicinity. The West Jay Gould is a stock company and managed by D. M. Sutton, who is quite sanguine that he has an extension of the original. If so, it is good enough for any one who follows mining.

The Homestake mine was not far distant, and

this mine paid large dividends for a year or two, but at present is closed down, for what reason I was not able to learn.

There is another fine prospect in this same district, the Alpha and Omega, that from the best information at hand will make itself heard from ere another year rolls around.

The ledges here are all gold-bearing, and in consequence a class of property that just now is much sought for, as there is no fluctuation in the value of a gold bar.

The Montana Central tunnel will be, when completed, 6300 feet in length. In its course it has already crossed on four-foot ledge of ore of fair grade that will pay to work. They expect to finish it by the 1st of October, 1888, but will probably lay a switch-back overhead and open their road by the 1st of June to Butte. This is something the Butte merchants and millmen have been devoutly wishing, in hopes that it will free them from the thralldom of a railroad pool on rates.

H.

## A School of Mining.

## California Boys Proving their Ability.

The number of young people in Grass Valley, California, approximating the age of 21 reaches the enormous number of about 1000 souls. Fully one-half of these are of the male sex, and nearly all of them were born and raised in Nevada county. This town has no considerable manufactories or businesses, except that of store-keeping and mining. For years and years the old prejudice prevailed unquestioned, that being American born, few if any of these boys could or would become first-class quar'z miners, and no general opportunity was allowed them to acquire the occupation that so many of their parents toiled at. When the mine-owners wanted men, they often sent to Europe for them, or else elected men of foreign birth at hand. It was regarded as a fixed fact that Grass Valley young men could not become miners. The most prominent mine-owners and the mine-owners favored the ridiculous prejudice to such an extent that there seemed to be no avenue for employment in the mines for the active young men of that town. It was held that to handle a pick or turn a drill or use a hammer, right and left, single-handed and properly, the workman must have spent his infancy and boyhood in the mines. The British idea that it takes at least seven years' apprenticeship to learn any trade ruled the roost, and as there was no such apprenticeship in Grass Valley there could not possibly be any miners among her native sons.

The result of this monstrous state of affairs has led most of the fathers in that city to exclaim, "What on earth is to become of our boys?" Many of them thought seriously of sending their boys to Europe, so that after awhile they might return and be "recognized" as miners.

Within the past two years a wonderful change has come over Grass Valley in the above respect. It is no longer admitted as above dispute that natives of Grass Valley, or of any other part of America, cannot become as good miners as any in the world, or that it requires a long apprenticeship to turn a drill, light a fuse or strike a pick successfully. On the contrary, it has been demonstrated that with the natural deftness of all American-born people, these young men can, in about as many months as it was formerly supposed to require years, master the details of quartz mining and become workmen equal in every respect to the best miners from Hungary or Cornwall.

"Yes, sir," said a well-known mining boss (himself a naturalized citizen) the other day, "we thought we would experiment with our home raw material, and the success that has followed has simply astonished ourselves. After six months' work in our mines we find that the majority of our boys can go anywhere and earn the \$3 or \$4 a day that is paid to competent miners. We hear from many of them afterward, from the mines on the Comstock, Montana, Colorado, Arizona and localities in this State, and they seem all able to hold their own with the best workmen when no favor is shown and no prejudice exists."

Of course these young men are, besides being industrious, fairly educated, some of them high-school graduates. It is not too much to expect that they themselves will in time become the foremen or superintendents or owners of the gold mines of California. Nothing could be more appropriate than that an industry such as quartz mining, which will forever be as permanent as that of farming, should in this State be operated, top and bottom, by natives of this State. None surely have a better right.

It is due to the Empire Company, at Grass Valley, to state that they were the first to practically thus demonstrate that California young men have in them the material for as good miners as any in the world. This fact of itself has caused the managers of this mine to become exceedingly popular with the "boys." Other mines are slowly following the example. A prejudice as deeply rooted as that which so long excluded them from this pursuit cannot be overthrown in a day; but it is bound to be entirely exterminated sooner or later. Of all pursuits, quartz mining is the one that can only be acquired by actual experience, and a well-conducted quartz mine must forever remain, after all, the only real "School of Mining" in the world.—Nevada Transcript.

## A Prospector's Address to the Rocky Mountains.

[Written for the Press.]

O mighty range of peaks and glens!  
Thy native muse inspires my pen;  
I lay to rest the pick and pan  
That I thy gorgeous scenes may scan.  
The hidden vaults of glittering ore  
That thou hast stood as sentinel o'er,  
Since earth from out of chaos came,  
Is not the spark that lights my flame;  
The graodeur that mine eyes behold  
Is more than all thy wealth of gold.  
Though future generations may  
Reveal thy trust to light of day,  
And pierce thy heart for Mammon's pride,  
Thy greater glories shall abide  
With thee for aye, and none shall dare  
Despoil thy contour high in air.  
They cannot rob thee of the spell  
That in thy towering crowns doth dwell,  
Nor mar th' enrapturing scenes displayed  
In placid pond or grassy glade,  
Environed by thy cliffs and crags,  
Where longing, loving memory lags.  
No hard that once beheld thy grace  
Could stand unawed before thy face.  
The verdant vales below thee lie,  
Thy snowy crowns doth pierce the sky;  
Ere morning's sun has kissed the plain,  
Thy crests present a golden chain,  
The forests wild that gird thy sides,  
The bounding game that in them hides,  
The crystal waters laughing near—  
All tend thy lover's heart to cheer.  
When threatening clouds are hovering low,  
Thy head above thy foot below.  
The pealing thunders, lightning's flame,  
May spend their force on thee in vain.  
As some proud soul in human form,  
Whose breast is hard to every storm  
Of life, the sun's effulgent beam  
Still shines above the mists serene.  
When time was young, the earthquake's shock  
That made thy very bosom rock,  
And rent the granite fields in twain,  
Exalted thee above the plane  
And made thee all that thou hast been—  
An artist's love! a poet's theme!  
So may the spirit racked with care  
Become at last more sweet and fair—  
Too pure to be by pen portrayed,  
Too high to be on canvas laid,  
O proud and peaceful monarchs, stand!  
Emblem of life to mortal man!  
To you a lesson each may read,  
That have and earnest men succeed;  
Though tempests rave, there are heights sublime  
Where scintillant suns shall ever shine.

Glendale, M. T.

HENRY W. BROWN.

## Eastern Washington.

\* A letter from Spokane Falls to the *Boite Inter-Mountain* says: Mining men are constantly leaving Spokane for the different sections where their interests lie, and they in turn are being supplanted by new arrivals bent upon an exploring expedition into some one of the contiguous regions. Thomas Lowthion, the well-known Denver expert, came in a few days since and has left for the Okanogan section, where he purchased some valuable interests last season. He has unlimited faith in the future of that section and owns some of the most promising prospects in the camp. Ex-Governor Charles E. Loughton of Nevada, now residing at Tacoma, and manager of the Salmon River Mill and Mining Co., recently organized in Tacoma, stopped over Sunday in Spokane on his way to the mines. The machinery for the new concentrator erected by this company was shipped to-day for the mines and will be erected at an early date. Mr. Loughton feels very much elated over the prospects of that section and says that the developments the present season will astonish the world. From Mr. R. R. Hargrave, who has just returned from the camp, it is learned that two or three very important sales have taken place recently, one of them being the La Brea. The development work on the La Brea is about as extensive as any other claim in the entire camp, and the purchase is considered a bargain. Late advice from the Kootenai district say that a stampede is being made to that section, but that the snow is too deep for any prospecting to be accomplished of any consequence, and the miners are advised by those already arrived to stay out for some four or six weeks yet. The snow is seven or eight feet deep on the mountains, and prospecting is impossible outside of the valleys. The developments on the properties being opened up are showing fine returns, and the mines look as promising as ever.

GREAT FALLS REDUCTION WORKS.—If Great Falls carries out what is proposed in the way of mammoth smelting and general reduction works for handling the great ore beds of Montana, she will surely become at home what the distant Swansea of Wales is to the world at large under the present regime. But this prestige may soon be diverted from Northern to Central Montana. It is authoritatively announced within the past week that the great Northern Pacific combination, with S. T. Hanser at its head, will proceed at once to build anything yet constructed or contemplated for ore-reduction purposes in the world. The location of these great works has doubtless been determined upon, but not made public. We think it rests between three points—the Prickly Pear basin on one side of us, Livingston on the other, and Bedford, situated on the ever-flowing warm springs across the river from Townsend. Bedford has all the natural advantages required, having not only the requisite amount of never-failing water and water-power,

convenient extensive dumpage grounds, but is as centrally located upon the N. P. railroad as any other point suggested. The outlook is favorable for Valley county possessing in the near future the Swansea of the world.—Townsend *Tramant*.

GYPSUM.—The *Stockton Independent* says: Stockton is to have another large manufactory, to be operated by the Pacific Gypsum and Fertilizer Co. The company has been organized in this city with L. U. Shippee as President; Edwin F. Smith of Sacramento, Secretary and Business Manager; W. G. Scott of Nevada, General Superintendent. Col. J. B. Wright of Sacramento is a heavy stockholder, and a number of Stockton capitalists are largely interested in the enterprise. The capital stock of the corporation is \$1,000,000, and the principal place of business will be in this city. The purpose of the company is to mine, manufacture, and deal in gypsum and other material for the fertilization and improvement of soils; to carry on traffic in plaster, cement, tile and stone, and to engage in the purchase, reclamation and sales of lands. The company's mines are located in Humboldt county, Nev., and millions of tons of the purest variety of gypsum are exposed to view within a few miles of the main Central Pacific railroad. It is the intention to bring the mineral to Stockton in bulk and mill it here, making this the market for the coast. An average sample analysis of the commercial article from these mines, made by Prof. Hilgard of the State University of California, returned less than one per cent of foreign matter, showing over 99 per cent of pure gypsum or sulfate of lime.

BACK FROM KOOTENAI.—Ed Bolger, who has been visiting the Kootenai country in the British possessions, returned after an absence of three weeks. He says that little can be told at present of the future prospect of the camp he visited, but few people were there, not exceeding 40 at most; about 12 miners were at work, but the rest waiting for the snow to disappear. This will take fully two months, according to statements of parties that have resided there for some years. John and Jap King, Billy and Charley Chambers, Snyder, Tom McCloud, Ike Nail, McDougal, Bob Buchanan, all Coeur d'Alenars, are there, and John Ward, the well-known restaurant man, was at the month of Kootenai lake, about 70 miles south of the camp, on his way there with a restaurant outfit, accompanied by his partner, McDonald, Al Markie and two Indians in attendance. The only locations as yet open and showing mineral are the Silver King, Silver Queen, Bonanza, Iroquois, Grizzly, Toughnut and the Giveout. Mr. Bolger says he cannot advise any one to undertake a journey there at this time. The trip is a hard one and prospecting an impossibility with the snow in its present condition.—Wardner News.

THE SACRAMENTO RAILROAD SHOPS.—The Southern Pacific Company has broken ground and commenced erecting large extensions of their shops in Sacramento. There are now over 2100 men employed, but the capacity of the shop is very deficient for present demands, and the present enlargement will enable an increase of the force about one-half. The new additions will give about two acres area of floor room. The building will be constructed of framework and corrugated-iron covering. An extension of the boiler-shop will be 90x150 feet. The machine-shop will be extended 100x112 feet. The car-shop will be enlarged 90x92 feet, and the paint-shop 85x180 feet. A new car-shop will also be erected 75x150 feet, and an oil-house 50x100 feet. The ground is already broken for these buildings and others are contemplated. Electric lights are being put in to light the entire grounds around the shops, as well as the interior of the structure, so that night shifts can be worked as successfully as by daylight if necessary, and they probably will be. The enlargement of the shops is to be crowded forward as rapidly as possible.

REDUCTION WORKS.—It is now almost a certainty that reduction works are to be erected at Luning. Suitable facilities for the economical reduction of ore has been one of the greatest drawbacks to our several mining districts. Under present circumstances, our mine-owners are compelled to ship their ore to Selby or some other works at a distance to have it reduced, thereby making it necessary that the ore should be of a high grade to stand the additional expense of transportation. With suitable reduction works within the limits of our country, men who now have quantities of \$20 and \$30 ore on the dumps of their mines will be able to have it worked and receive a fair compensation for their labor. In this way they will be encouraged; and with the money they would receive from the low-grade ore now on the dumps they would be able to more fully develop their mines, and possibly in the course of a short time open up valuable properties. It is hoped that there will be no unnecessary delay in the construction of these works at Luning.—*Emeralda News*.

DURING the month of March there was worked at the mill, for account of the Potosi Mining Company, 1550 tons of ore, yielding hillion of the gross value of \$33,232.91. The cost of reduction was \$10,850, and the net proceeds in hillion amounted to \$22,382.91. The assay value of the ore per ton was \$23.86. The gross average yield in hillion per ton was \$21.45, and the net average per ton was \$14.45.

## A New Theory of Coal Formation.

Old age gives one a sort of right to be reminiscent. I hold that I am, by virtue of three-score years, entitled to that right. I want to enjoy it now.

I saw in the *Illustrated Pacific States*—this journal—what was copied from the reported transactions of the Geological Society of London where Mr. W. S. Gresley "adduced evidence against the theory that coal-seams were formed from vegetation growing on the spot." Now there is a question that I settled for my own mind, and the minds of a few others, as far back as the year A. D. 1847-8. I found and proved then that true coal (not lignite) is not formed from vegetation

### Grown on Any Spot.

True coals, whether bituminous or anthracite, are the product and residuum of ancient petroleum discharges from the interior earth into most ancient receptacles, lakes or pools; in which receptacles the oils had eons of years to evaporate and harden into what we now call coal—stone-coal. How the dynamic and static pressure mounted these oil receptacles with untold millions of tons weight is not for me to state; but of one thing I am certain, that, like the renowned bedbug of modern song and story, they "got there all the same." How, then, do I account for the impression of various plants, leaves, woods and roots in the coal-seams, or beds? That is just what I am going to be reminiscent about.

Here goes. My respected and lamented father was a contractor and builder, in the city of Wheeling, Virginia (now West Virginia), in the summer season, and a coal-mining merchant in the winter season, and he had four boys, of whom I was the youngest. We boys all had to work—not only to work but to work at whatever he put us to doing. He was a Scotchman, though perhaps about five-hundred ngo, as his name indicates, his remote ancestors might have been of Gallic origin, but, at all events, he had all the sternness, integrity and unflinching grit of the old hard-headed (not very soft-hearted) Scotch Christian.

He was, as are most of his kind, a little cranked on the subject of "a good education," and with him "a good education" meant to be able to "cast up accounts quickly and void of errors," to "write a good plain round hand," to be able to "draw a fair contract according to law," to "read the Bible intelligibly" and to "lead in family worship." Still, while these were his general fixed and permanent ideas of good education, he was not really averse, where parents could well afford the expense, to a higher, academic or collegiate education; provided, always, that the curriculum, as he called it, should be of a solid and serious nature.

There were no such places as houses of public schools, or common schools, in my early days where I was born and reared. We had the school by "the quarter"—three months at a time—and paid cash for tuition, books, house-rent and fuel; so we did not go to school very much. But, after awhile, from the proceeds of the estate of a good, dead, rich man we got an academy. I was sent to it. The teacher, Captain Gray, formerly of the British Army, and pupil if not graduate of Glasgow University, Scotland, was a tall Scotchman.

In those days books were scarce and costly—not plenty and cheap as they are now—and I never had seen or heard of such words as

### Geology or "Mineralogy."

But I had been brought up among claybanks, limekilns, limestone quarries, freestone quarries, coal mines, iron ores, smelters and foundries; therefore to a degree I was a geologist and mineralogist without knowing it. I was astonished when Captain Gray—I think his name was Gray—on one Friday evening, just as he was about to "let us out," stated that if ten or more boys would come to his boarding-house next day, Saturday, at 10 o'clock A. M., he would form a free class for the occasional study of geology and mineralogy.

So on Saturday, instead of sorting the slate and sulphur stones—pyrites of iron nodules—out of the pile, or dump, of waste, or dirty coals at father's mine, I went to study geology. But I was half disappointed when Prof. John Gray, of the University of Glasgow, led us boys

### Right Straight to the Coal Pile

Where I had worked every Saturday all winter. Still, right there he delivered a very fair sort of a short lecture on the formation of coals—stone coals.

The coal veins of West Virginia, Eastern Ohio and Western Pennsylvania, along both sides of the Ohio river, are (as far as then developed) in the big hills where they lie almost horizontal; only somewhat dish-shaped where the hill is highest and heaviest—that is to say, the coal vein is most sunken under the bodies of most weight. In the river-hills these veins are from 4 to 5 feet thick and the coal is of the bituminous—or fat coal—variety, and burns with a heavy smoke and lambent flame.

But the vein is not all good coal. There is "top coal," which is the purest coal, and it occupies about two-thirds or less of the vein from the top downward to where it strikes a body of impurity of three to six inches in thickness; and below that, to the floor, is the bottom coal. This vein of impurity running through the coal body contains some good coal mixed with thin layers of sandy black slate and kidney-shaped nodules of iron pyrites, commonly called "sulphur stones," "copper balls," etc. These nodules, when placed upon the fire-grate, and heated hot, explode and

Throw Their Pieces into the Family Circle To the great disgust of the housekeeper. Hence you can see that coals thus afflicted were

better to be dumped to one side and assorted so that the coals could go to market, the iron pyrites to the chemical works for copperas, and the slate could go—well, could go to thunder. This sorting was my business on Saturdays.

Now, of course, being an observant youth, I noted some features in my work, and thus, long before I had met Prof. John Gray of Glasgow University, Scotland, I had asked myself: Why is it that the whole body of the top coal is a solid mass like jet-black rosin while the slate vein and the bottom coal are laminated; and why is it that at the sandiest part of the slate vein I find the most fossil prints of vegetation, such as fern leaves and the like, while in the solid top coal I never—or very seldom—find anything but pure coal? I could not resist the impression that, in some way, the top coal must have been made later than the slate vein or the bottom coal; but how that could be done I had no idea.

But now comes Prof. Gray to the coal pile and tells us that this coal vein was once—thousands of years ago—

### A Vast Mass of Vegetation.

And to prove which he picked up, out of my own collection, several specimens of the imprints of fossil plants. Then he explained how those old-time plants, falling for untold ages around the great steaming lagoons, were drifted into vast bodies and covered by great weight, for ages and ages again, until they became fossilized, bituminized carbon for the future use of man and the glory of God.

When the class in geology adjourned I walked homeward along with and her youth of about my own age, and as we walked along I exclaimed:

"I do not believe that!"  
"Don't believe what?"  
"Why, that stone coal is petrified vegetation. It can't be."

"What is it, then?"  
"Well, that's what I don't know." (Petroleum was not then known in large quantity.)  
"Well, then, you ought not to contradict them as do know."

"Oh yes. Galileo could contradict the civilized world before he could explain it all." (I had heard about Galileo and Columbus.)

Just then we were overtaken by a pair of coal miners coming home from work. One of these miners was an Englishman and for several years of his life had been a sea-going sailor from Liverpool to Brazil. To this sailor-miner the other boy said, pointing to me:

"He says coal is not made out of wood and vegetables."  
"Wot do 'ee say 'tis made of, lad?"  
"Well," said I, "I don't know, but I'll tell you what I think."  
"Wot is it?"

"I think there must have been, as Prof. Gray says, great ponds, and I say some sort of stuff or lava-like track of a greasy nature

Bubbled up or Poured Out on these Ponds For awhile and then stopped—that made bottom coal. Then the water of the pond sloshed about over this bottom coal and carried slum and fine sand over it—that's the slate vein. Then the outpour of this stuff started again and flooded the ponds on top of the bottom coal and the slaty vein—and that is top coal. Of course some trees and vegetables could get washed into this stuff."

"Blast me bloody eyes, but I think you 'ave it, lad. It ever you go to the Hiland of Trinidad, in the West Indies, you'll see wot you're takin' about. There's a lake as they calls the Lake of Bitumen, and it's a good hour's walk around it, and it's nothin' but the world but some kind o' pitch as cometh out o' the ground—and it'll burn like tur."

Still, notwithstanding the partial confirmation of my theory by the miner-sailor, these were the words read by Capt. Gray from the works on Geology: "It is difficult to determine, however, in what manner (coal) has been formed, or by what operations the vegetable matter, from which it has originated, has been so far modified as to have assumed the properties under which it exists." (The italicizing is mine.)

The ordinary intelligent coal miner, while he did not dispute it directly, did not take very kindly to the

### Vegetable Origin of Coal;

So, when I found an educated German who translated to me from the "German Conversations-Lexicon" (of an edition dated prior to A. D. 1829) an account of the bitumen lake and other bitumen deposits, I was able to make a few positive converts among coal-mining people to the idea that coal is not a product of petrified vegetables.

Along about 1848-9 I left off hard work for awhile, went to study something else, and lost sight of the coal business, and also of geology and mineralogy; but in A. D. 1860-61 came the "coal oil"—petroleum—excitement in Pennsylvania, West Virginia and Ohio. I fell into line with that energetic epoch, and while prospecting for petroleum I found the evaporated petroleum—or bitumen—in thin veins, pressed between the ancient laminated rocks, and, so far as I could see or find out, those thin veins were

### Identical in Form, Construction and Character

With the top-coal of the bituminous coal veins in West Virginia. Ever since then I don't go a cent on the theory of the vegetable origin of coal. To my mind the imprint of fossilized plants in coal is an accident somewhat resembling the accident of a long red human hair in a roll of country butter—which goes to prove that there may be a red-headed girl in the farmer's family but is no evidence as to which cow originated the basis of the butter.

Yet, after all, nevertheless and notwithstanding, if any philosopher, scientist or observer will prove that petroleum is a vegetable oil,

which I think cannot be done, then my theory is "a goner;" but I will not take fossil plants in coal as evidence of the vegetable origin of coal. The advocate of the vegetable coal origin must first reduce his vegetables to oil—and very old oil at that—before bringing his case into this court.—J. W. GALLY in *Illustrated Pacific States*.

## The Mines and Miners.

BY PEDRO CASTERA.

(Continued from our last.)

(Translated for the Press from *El Minero Mexicano* by M. N. M.)

### The Mine de la Cruz

Was one of the oldest, and possessed deep and extensive works. It was exploited by an English company which was making it clean and secure before commencing to extract the ore. The mine had two shafts separated by a distance of 300 varas, and of about the same depth. Through one of these they effected drainages by the ancient system of malacates (windlasses), and the other, the mouth of which was in the patio (yard) of the mine, served as entrance and outlet for the trajadores, or those who worked in the mine. It had besides a socavon (tunnel) 400 varas long that was abandoned because it was in danger of falling in.

In the large patio toward the interior of which the doors of the administration, forge, and other offices of the mine opened, two young men were walking arm-in-arm, their tracks marked upon the snow that covered the pavement. One was tall, robust, strong, of a pallid color, and with a sad, restless look. He was the chief miner, whose name was Leon. The other was ruddy, slender, short, with blue eyes, spacious forehead, and an agility that was noticeable in the least of his movements. His name was Henry, and he was a mining engineer, who had arrived the evening before, with the intention of practicing in order to obtain his professional title. They were intimate friends.

### "How Do You Like the Mine?"

Inquired Leon of his companion.  
"It is detestable!" he replied. "As it is the first that I have visited, it has given me a bad impression. I went down yesterday through the tiro of San Miguel, a deep, dark, pestilential shaft, by a rope ladder, filthy and slippery, to a work they call La Luz, but which is rather one of darkness. It is in a square canyon, four meters wide and more than two hundred long, the pavement full of mud and its sides and roof lined with great beams which resemble the spine of some monstrous animal. Twelve varas to the left runs another identical canyon parallel to this called La Preciosa. Both were hot, dark, miry, miasmatic and infested with rats. They were connected by diverse passages. Is this mine given over to the rats?"

"Only to clean it. Rats are the scavengers of mines."

"It is loathsome," said Henry. "As I rested my hand upon a beam to keep from falling, I felt something gliding between my fingers. At the capital I conceived the mines to be different."

"I can readily believe that. In Mexico a miner is somewhat fantastic in regard to events and acts. He likes to see them through a telescope."

"Better a microscope," replied Henry. "Everything is small, and therefore we should use this lens. The small and the great are relative ideas and the same is applicable to both."

### Everything in Creation is Admirable.

A cubic millimeter of matter contains eight sextillions of atoms, and the Via Lactea eighteen millions of stars. If we could spread out or expand a molecule, we would get a nebula, and compressing the latter, would obtain the former. The drop of dew, trembling in the chalice, which reproduces the rainbow, is composed of 100 parts of oxygen and 12 50 of hydrogen, the same as the water of the enormous tromba. The flowers change their pollen as the stars their light. The phosphores which burn in the glow-worm, likewise vivifies your brain. The little animals which swim in the pupils of your eyes consume the oxygen of the air in order to breathe and live, and who knows but that the burning comet, with its luminous tail, may not also respire in the ether? The smallest is often the most marvelous. Affinity is similar to gravitation, but to me it is far more admirable. Linnaeus and Newton show me that all things are relative and that only God is absolute."

"That is true," replied Henry. "Beyond the reach of every lens fixed on any point whatever, there is the infinite."

"Hence the grandeur of thinking," said Leon. "To think is to see; it is to expand the mind, to multiply life, and to augment our faculties. He who thinks struggles, because he meditates, incubates, labors; to superior thought, superior will. Plato by thinking saw America across the Centuriae in Atlantis. Wise men meditated upon that idea. Columbus incubated it, and hence the birth of a new world. What is greater than to think?"

"To feel," replied Henry. "For me, ideas are reflections of the sentiment. Nature is as much a work of art as a work of love. Two beings that gravitate like two stars. Humanity is an immense heart. I wish to feel, to suffer, and to enjoy it all, submerging myself in the tem-

pestuous sea of the passions. For me, to think is to doubt, while to feel is to believe, because it is to love. I would rather be Byron than Thales."

"Let us not discuss," said Leon. "There is nothing so beautiful as liberty, but there is also nothing so respectable as conscience. The sanction of right within is above all. For my part, I am disgusted with the life of a miner, which, though it includes study, has much more of action. I think of renouncing my employment and returning to the capital to prosecute my studies."

"Your studies, Leon! What more do you desire to learn? You know mathematics, mechanics, physics, chemistry, geology, zoology and botany, or what is the same, the exact and natural sciences. What more do you desire?"

"Every engineer ought to know that. I have studied philosophy, ethics, history and astronomy; but, like the Greek philosopher, I confess that I know nothing."

"What more do you wish to study?"  
"Everything—absolutely everything. I have an unlimited thirst for knowledge."

"Ah, Leon, some day you will

### Be an Old Man Like Faust.

And you will seek love as the golden key of life."

"That is true—I will grow old bending over my books, and like him, I shall some day have the universe beneath my brow."

"And in the meantime—how will you live here?"

"I will rise at five o'clock, go to the mine, oversee the work, leave it at ten and eat something, study the rest of the day, return at six o'clock to the mine, review the work, leave at 11; and the next day pursue a similar course."

"Pooh—that is a monotonous and disgusting life!"

Leon was about to reply, when at that moment a boy came running from the mine, and, seizing the cord of the bell-clapper, sounded the alarm of fire. Hardly had the bronze voice waves the cry for succor, when all those connected with the mine suffered an electrical shock. From all the houses of the Real, the patios of the mines, and the various haciendas, were seen issuing numerous groups of laborers, who were coming to the assistance of their companions. The church-bell began to ring and then there broke forth that song, so singularly sad, that, heard but once in a lifetime, is never forgotten—the Alabado.

Quemazon! Quemazon! screamed the pepenadores (workmen who assort ore) grouping themselves near the door of the shaft, which was beginning to throw out a column of smoke.

### The Mine is Burning!

Fire! fire! vociferated the operatives, running in all directions with tumultuous disorder. Sin novedad—sin novedad (no danger) said with firm voices the sentinels of the patio and the porters of the tiro, while the bell continued giving its note of alarm. The director, the administrator and other placemen, leaving their offices and their respective tasks, came out to the patio of the mine and were there joined by the two young men. Said Leon to Henry, who had turned somewhat pale: "I have here a variety of the life of a miner. Go and amuse yourself."

"What are they doing?" inquired the director of his second, the administrator.

"What are they doing?" inquired the latter of the chief miner.

"I have received no information," replied Leon.

"Nothing has been transmitted, senior director," said the administrator.

The director, when he heard that reply, crossed his arms and contemplated the disorder of the patio, which for some moments had been increasing.

"But this is absurd!" said Henry to his companion. "If the mine is burning, why not give assistance to those who are in it?"

"Because there is yet no notice."

"But what does that matter?"

"We are not permitted to interrupt the order of things. Come here, Tildio!" Leon exclaimed to the boy who was tolling the bell. The latter was a child about twelve years old—pale, thin, nervous, flexible, slightly developed, but strong and agile. He had an aquiline nose, fine lips, a dark skin and small black eyes, which were very lively and wonderfully expressive. His name was Juan, but he was nicknamed *el Tildio*.

### (To be Continued.)

A PIGEON IN A MINE.—Tuesday morning a pure white live pigeon was found nesting at the bottom of the shaft in the Andes mine, at a depth of 500 feet below the surface. The winged victor was easily captured by the miners who discovered it, and it was brought to the surface. After a long discussion as to whether it should be held in captivity or released, it was decided to liberate the prisoner. When set free the pigeon hovered about its captors for a moment, as if for the purpose of attracting their attention, and then suddenly darted due northwest with the speed of an arrow.—*Virginia Chronicle*.

A REVOLVING WRENCH.—A wrench recently patented in England consists of a circular head provided with jaws of different sizes. This head can be revolved on the handle, and held in the position desired by means of a bolt-head engaging with one of the jaws.

## Passing Events.

The Comstock mines are now making a larger monthly bullion product than for any time in ten years past. Moreover, the yield is gradually increasing. Curiously enough, mining stocks are very low in price in the face of these facts.

Rain is quite badly needed in this State, and there is some uneasiness felt in certain sections over the lack of moisture.

The inauguration of a new railroad from San Diego to Cuyamaca in San Diego county will be a good thing for the Banner and Julian mining districts. Ground was broken this week.

Reports from the new Salmon mine on the Northwest coast are not very favorable. Still developments have not yet progressed sufficiently to prove the value of the mines.

The Southern California papers are filled with accounts of the gold found in Lower California. Coarse gold and nuggets are reported. The mines are on a grant which has been made to a company, and this company is prospecting the field. They will allow no dry-washers to be used, but permit miners to work with pick, shovel and pan. Only experienced miners with a good outfit can do anything. It is no place for poor men to go. If no land-owning companies were interested in the region there would be more confidence placed in the published statements.

## Why Our Cheap Natural Products are Neglected.

It is matter for surprise to those not familiar with the industrial conditions that obtain in California the limited extent to which we have utilized the useful minerals and metals here so abundant. A novel feature of the case, and one that would tend to further increase the wonderment of these strangers, were it brought home to their knowledge, consists in the fact that we are doing even less toward turning these subordinate forms of our natural wealth to practical account now than formerly. Of coal, lead and copper the output in California has been growing less and less for some time past. Our deposits of manganese, sulphur, and graphite operated for a season, mostly in an experimental way, have long since ceased to be worked. With our extensive beds of fire-clay, gypsum, marl and cement, little has ever been done or attempted. The only effort ever made here to manufacture iron, proving unprofitable, was abandoned several years since. We make some plaster of Paris, soda and salt, but not enough to keep out large importations. Mining for antimony and chromium struggles along, fluctuating a little, but without making any perceptible gains from year to year. The business of gathering magnesia, essayed for awhile in Livermore valley, died last year with the early flowers. We dig from our great masses of asphaltum enough of that mineral for home use, but no more. Of asbestos and mica we have plenty, but use very little, the production of quicksilver, borax and petroleum being in this department of our material resources the only active and important industries.

Now, the stranger within our gates looking about and seeing these useful substances so little drawn upon, or so wholly neglected, would be apt to set this down to our want of enterprise and thrift. And yet, were he to do so, he would arrive at a wrong conclusion. What to him would appear proof of had husbandry is in reality evidence of our sagacity and business sense. Paradoxical as it may seem, it is not because we are so shiftless, but because we are so prosperous, that these minor products of nature have been so overlooked and neglected. Having other and better paying pursuits to engage our time and means, these of secondary importance have been relegated to their proper place on the industrial calendar.

A quarter of a century ago, when gold mining in California seemed threatened with a fatal decadence, and before the agricultural capabilities of our soil and climate had been more than partially tested, many of our enterprising citizens, believing that the time had come for developing these deposits of the useful minerals and metals, set on foot a number of schemes directed to that end. Coal, copper and petroleum; tin, iron, antimony, plumbago, manganese and chrome; salt, marble, soda and cement; in short, nearly everything in the line of cheap commodities was duly looked after. Though much money was invested in these several enterprises, and the whole conducted with energy and care, the most of them proved in the end financial failures.

For these untoward results the originators and managers of these well-meant projects were not to blame. They acted from the best of motives and with what at the time seemed good judgment. But a new and a better industrial epoch was about to dawn on California. While this experimenting in new directions was in progress, gold mining in California began to revive, the discovery of silver in Washoe imparting meantime a great impetus to that branch of the business. Land culture in all its departments developed an astonishing and unlooked-for importance. Capital and wages, instead of declining, remained dear as ever, and the cheap labor on which these seekers after this new departure had mainly depended for success failed to materialize. In the fields and the mines, in the forests and the fisheries, on land and on sea, there was remunerative employment for all. The day of small things in California had evidently been postponed; and what, under the circumstances, could our adventurers in these new industrial fields do but retire?

From our past experience, so abounding with fruitless endeavor, the fact is evolved that cheap commodities cannot yet be profitably produced in California, nor yet anywhere on the Pacific Coast. With miners' wages ranging from \$2.50 to \$3.50 per day, we cannot af-

ford to get out manganese, graphite, manganese chromium, soda and like low-price substances which command abroad, where we have to find our principal market for them, only from \$15 to \$30 per ton. Mining these, beyond what is required for home use, can only be done at a loss unless the conditions be exceptionally favorable. We can hope to do but little with these products so long as mining for the precious metals and the cultivation of the soil warrant the payment of the present good wages.

## Quicksilver and the Tariff.

The quicksilver manufacturers of California have united in a memorial to Congress asking that, instead of admitting the article free of duty, a specific duty of from 20 to 25 cents per pound be imposed. The quicksilver interest in this State represents a capital of \$30,000,000, and gives permanent employment to more than 5000 men. Quicksilver is an absolute necessity in gold and silver mining. While the article was protected by a duty the business was fairly profitable, and some 30 mines were operated in this State, the only one in the Union producing quicksilver.

Within the last few years, since the abolition of the duty, the price has been reduced so low that there is little profit to quicksilver miners, and there are now only eight or ten mines being worked in California. The Spanish and Austrian mines, with rich ore and cheap labor, compete successfully with our home product under present circumstances. Many articles necessary in working quicksilver mines, particularly iron and steel, are subject to high duties. Empty quicksilver flasks are subject to a 35 per cent duty, and most of these flasks used in California are second-hand ones returned from China, on which the quicksilver manufacturers here are obliged to pay the high duty, often paying many times on the same flasks, while new flasks filled with quicksilver are imported into New York from Europe free of duty.

Owing to these facts all of the American market east of the Rocky mountains has been lost to home manufacturers and supplied with a foreign product, which pays no duty or revenue to the Government. The imposition of a duty on quicksilver would lead to no hardship or damage to other industries in this country; the article being used over many times in gold and silver mining, so that the small advance in price would practically be almost nothing in the cost of mining, while the only other industries which would be affected—the manufacture of vermilion and the manufacture of medicinal preparations from mercury, both of which are small in comparison with the manufacture of quicksilver—are now protected by a duty. The control of the Spanish product is a monopoly in the hands of Messrs. Rothschild. Before we began to produce quicksilver in California the price of the foreign was three times what it is now.

All other metals of American manufacture from native ores, iron, copper, zinc, lead, etc., are protected by high duties; quicksilver, which under present foreign competition seems to require it more than any other, forming almost the only exception. The California manufacturers consider that unless a duty of at least 20 cents a pound is imposed they cannot compete with the Spanish and Austrian Governments, and get a fair return for capital invested. The only producing mines in this country now are the New Almaden, Sulphur Bank, Great Western, Redington, New Idria, Napa Cons., Great Eastern, Etna, and Bradford. All of these are in California.

**LICK OBSERVATORY.**—Arrangements are being made for the transfer of the Lick Observatory from the Trustees of the Lick Trust to the Regents of the University of California. The Regents have received \$100,000 of the balance in hand, and in a few weeks will accept the completed observatory and the balance of the funds. Regente Hager, Hallidie, and Phelps have been appointed a committee to make arrangements for the ceremonies attending the transfer.

The borax works of William T. Coleman at the West End, Alameda, will close down in a few days and will not resume operations until after the summer months. Their closing will throw about 17 men out of employment, and is due to the fact that there is on hand a large quantity of manufactured borax.

## The Mining Laws.

We have several times referred to the amendments to the mining laws proposed by Senator Stewart of Nevada. The bill which he introduced was passed by the U. S. Senate on Tuesday. It was reported favorably by the Committee on Mines and Mining, and passed without debate.

The bill makes some material changes in the mining laws, some of which will please the miners, and others may not.

Among the changes are the following: The amount of work necessary to hold a placer claim is reduced from \$100 per annum to \$50, and limits the amount of placer ground that may be included in a patent to 160 acres. It fixes 12 o'clock noon, on the first day of August, as the commencement and end of the year for annual work, instead of midnight of the 31st of December, as now fixed by law. This change was made to allow relocation to be made in daylight and in summer-time, when the mountains are free from snow. This will please miners everywhere.

It requires, when the annual work is performed, the filing of an affidavit, showing the work performed, in the County Recorder's office of the county in which the mine is situated. It allows the affidavits, which are required to be made under the mining law, to be sworn to before any officer authorized to administer oaths in any State or Territory in the United States. It reserves the right of way through or over any mining claim for roads, ditches, canals, cuts and tunnels for the purpose of working other mines as now provided by law, and provides that any damages occasioned thereby to the mine-owner shall be assessed and paid in the manner provided by law for the condemnation of private property for public use in the States and Territories in which the mines are situated.

The most important provision is that which says that no person shall acquire by location or possession more than one mining claim on the same vein, nor shall any person relocate a claim which he has previously located. This is to prevent repeated locations of the same claim by the same person to evade the provision requiring annual work. The restriction to one claim on the same lode is really what the original law meant, but it has been construed otherwise, and this declaration makes its meaning certain.

Since this bill was introduced, the provisions concerning prevention of relocation and taking up more than one claim on a lode have been discussed by several of our correspondents. There is a difference of opinion as to benefits to be derived from such a law. Some miners do not want to be compelled to do annual work to hold their claims, and prefer to relocate. In fact a good many have this preference, and, no doubt, will "get over" the present laws by getting some one else to relocate for them, and then nominally buying them out. It must be said, however, that our mining laws are very liberal, and a man ought to find out in a year whether his claim is worth keeping or not. If it is worth keeping, it is worth, at least, working upon enough to cover the annual expenditure clause of the law. While the new provision may work hardship in individual cases, and probably will, it will, nevertheless, release for location many claims which have been held from year to year without any work being done upon them. If people who will work them will take such claims, it will be better for the general mining industry than it is to have them lie idle.

A TELEGRAM from E. S. Bahcock, Jr., who is now in the East, announces that he has secured funds for the erection of a blast-furnace on North Island, a part of the Coronado peninsula, San Diego county, with a capacity of 100 tons a day. Work will be begun at once, and the product will be used by the foundry just established on the beach.

MEN who have returned from the new Salmon river mines say that only about 40 men there have work, while some 200 are idle. At present state of development, it is a bad place for poor men to go to.

AN Aspen (Colo.) special to the News says: The famous Aspen Side Line mining case, which has been in the courts for nearly two years, was to-day settled by a compromise.

## Gold Ores.

## Milling by the Continuous Process.

(Written for the PRESS by E. C. VAN BLARCOM.)

This process—more generally known as the "Boss Process"—was patented in 1881 by the inventor, M. P. Boss of San Francisco. Old millmen did not take kindly to the process, and without giving it a just trial condemned it. That the process has a sound metallurgical basis is proven by the fact that wherever it comes in competition with mills working on the old principle of settling the sands in tanks and then changing them into the pans, it displaces them. For example, at the Gloster mill in Montana the Boss process showed an increase of ten per cent in the saving, and this at a saving of some \$2000 per month in the labor account of the mill. The process is now being introduced into the California mill on the Comstock, supplanting the old settling-tank system, and many other cases might be cited.

While it is generally conceded that the process is all it claims to be in the milling of silver ores, it is not generally known that the process is equally applicable to the milling of gold ores, especially to those ores in which the gold is in a very fine state of division or is "rusty."

During the winter of 1886-7 I was connected with the mill of the Jay Gould Mining Company (near Helena, Montana), and through the courtesy of the general manager, Mr. M. E. Downs, I am permitted to use some data which I acquired in my official position.

The mill is a 10 stamp "Standard Continuous Mill." The ore treated in this mill was essentially a gold ore, although, strictly speaking, it was an ore of gold and silver, as will be seen from the following assay, which represents the average for the month of April, 1887: Gold, 1.247 ounces per ton 2000 pounds; silver, 5.42 ounces per ton 2000 pounds.

The gold was free and in an infinitely fine

bons, the mill superintendent, that when they got "down to business" the average saving was 82 per cent of the gold, the total saving, including the sulphurets saved by the Frue vanners, being 92 per cent of the value contained in the ore.

The process, as practiced at the Jay Gould,

spring. The bottom of the grinding-pan is on a level with the top of the main line of pans; the muller runs at 72 revolutions per minute.

From the grinding-pan the pulp discharges into No. 1 of the main line of pans (of which there are six). Pans Nos. 2 and 5 are fitted with automatic arrangements for introducing

introduced into all the pans, excepting No. 1, which is only charged once on a run, every hour, the same amount having been withdrawn previously. The charging and discharging of the quicksilver is effected by a siphon tap at the bottom of and on one side of the pan.

The discharged quicksilver runs through pipes to the amalgam safe. The strained quicksilver from the safe is raised by an elevator to a tank above the level of the pans and by a line of pipes is drawn into the siphon, or more properly speaking, quicksilver trap, when needed for charging.

About four inches from the top the pans are connected by a four-inch piping; in the same manner the pan system is connected with the settlers, the settlers being similarly connected one with another. Through these communications the pulp flows continuously, taking about eight hours to pass through the system. In the settlers, of which there are three, the pulp is diluted by means of a stream of fresh water; the settlers run at 16 revolutions per minute.

When necessary, for repairing or other causes, any pan can be cut out of the system, the pulp being made to pass it by means of an arrangement working on the principle of an injector; the pans are emptied by means of a steam siphon.

The pans and settlers are set in a line over the main shaft with which they are connected by a friction-clutch and bevel-gearing. The pulp as it came from the battery was so coarse that only 40 per cent would go through a 40-mesh sieve, while 90 per cent of the tailing sample passed through a hundred-mesh sieve.

There were employed in the mill a panman, batteryman and roustabout on each shift of 12 hours. The average milling was three tons to the stamp in 24 hours.

The general arrangement of the mill is shown in the accompanying sketches. It will be noticed that there is very little grading neces-

SECTIONAL ELEVATION OF CONTINUOUS MILL.

was essentially as follows: The ore was crushed in an ordinary battery fitted with No. 3 slotted screens; barely enough water to

chemicals. At first, salt and bluestone were introduced into the charge at pan No. 2, and quicklime at No. 5. Experimenta proved that

PLAN OF TEN-STAMP STANDARD CONTINUOUS MILL FOR GOLD AND SILVER ORES.

state of division, in samples running as high as 60 ounces to the ton; it was impossible to detect it with the naked eye.

The matrix was a close-grained quartz carrying some oxide of manganese and iron pyrites. As the ore was delivered at the mill, it was more or less mixed with a hard argillaceous rock and soft clay, both of which, under the stamps, produced abundant slimes.

The milling for the month referred to showed a saving of 77.6 per cent of the gold, and 45.3 per cent of the silver contained in the ore. Average fineness of the hullion was 988. These percentages were low for known causes. I have since been informed by Mr. W. B. Gih-

run out the pulp was admitted into the battery. Samples of the pulp showed the water to be about 60 per cent of the weight. From the battery the pulp discharged through a 2½-inch pipe into the center of a small grinding-pan. The grinding-pan is three feet six inches in inside diameter; the muller-shoes and pan dies are solid circular rings with radial grooves for facilitating the discharge of the ground pulp, after the manner of the old-fashioned stones in flouring mills. To insure grinding and compensate for the wear on the shoes and dies, a stout steel spring is fitted under the cap of the driver on the pan-spindle, a turn of the wheel from time to time sets down the

the use of bluestone increased the percentage of silver saved but diminished that of the gold; the use of salt alone had no effect, hence the use of these chemicals was discontinued. The alkaline action of the lime was found beneficial for keeping the quicksilver clean and reducing any "floured quick."

In running, the muller in pan No. 1 was set to grind, while the remainder of the pans ran with the mullers up, the rate being 72 revolutions per minute. The pans are heated by the exhaust steam from the engine. The details of the pan were fully illustrated in the PRESS of February 25, 1888.

About 200 pounds of fresh quicksilver was in-

itary—in fact this mill is much more economical in the details of construction than an ordinary mill.

THE Drumlummon mine of Montana yielded last year \$2,040,672. The company expended on revenue and permanent improvement account \$746,621. They crushed 75,000 tons last year. Average yield of high-grade ore, \$40.87; average of low grade, \$13.71.

MITCHELL has proposed an amendment to the Indian Appropriation Bill, authorizing the purchase by the Government of such portions of timber and mineral lands in the Coeur d'Alene reservations as the Indians are willing to sell.

## MECHANICAL PROGRESS.

## Activity in Car and Locomotive Building.

There is every indication that more cars and locomotives will be built in the United States during 1888 than ever before in any one year. The number of locomotives, and passenger, freight, and baggage cars annually built has been constantly increasing for the last five or six years. The number built during 1886 was as follows: Locomotives, 26,415; passenger cars, 19,252; baggage and mail cars, 6325; freight cars, 845,914—a total, aside from locomotives, of \$71,491. It is estimated that the total of passenger cars alone will more than double the build of last year.

Very few persons are aware of the immense consumption of iron involved in car building. A passenger car requires two tons of bar iron and three tons of wheels and axles. For freight cars the aggregate is somewhat less. Over 4,000,000 tons of iron and steel will probably be required for car construction the present year, aside from the enormous amount involved in locomotive construction, of which probably 30,000 will be built. Car and locomotive building will make an enormous demand for the products of our shops and forges for this business alone.

## Iron and Steel Cars.

In addition to the use of iron for the construction of cars in the ordinary way, there is the fullest reason to believe that the bodies, as well as the running gear of passenger cars, will soon be entirely constructed of iron. Various designs have been proposed, but one of the best appears to be a design which has recently been placed before the public by Mr. C. W. M. Smith of this city. The design was submitted to the careful inspection of the late master mechanic of the Central Pacific railroad, Mr. A. J. Stevens, who said in writing that it was "wholly practical and will be as tight as a drum on the track without reverberation. It is the car of the near future, and you can build it much lighter than you think for."

The whole interior of the car will be constructed of malleable steel. The surface of the metal sheets inside will simply be faced with a thin lining of linoleum, tastefully embossed and practically incombustible. The upholstery will be finished with suitably ornamented and embossed leather or compressed paper. The floors and platforms will be constructed of a single sheet of steel. The sides, ends and roof will be connected with angle beams of a peculiar and fitting construction. It is claimed that a car can be constructed in this manner cheaper than one of wood, and, when constructed, it will be a tower of strength and a fortress as well. An express car of such construction with iron shutters would be perfectly safe against any ordinary attack of robbers. In cases of collisions it could not be telescoped, and there would be no danger from splinters, which usually cause the principal injury to passengers; neither would there be any danger whatever from fire. In cases of violent shocks the couplings would part or the colliding cars be thrown sideways or endways without penetration or breaking up. Iron must soon become the material for car construction.

**STEEL RAILWAY AXLES.**—Steel, says the *American Exporter*, in all probability will soon be as well established in practical use for railway axles as it is now for rails. Mysterious failures heretofore noted in use of steel axles can be prevented by a toughening process, which has been in use at some Pennsylvania steel works during the past year with phenomenal results. The most severe inspection test has failed to show any irregularity or weakness in the axles. The supplementary test of 50 blows of 1640 pounds drop at 25 feet has now been passed by 50 consecutive test axles. This makes a test tenfold more severe than the railroad inspection, and is a guarantee of a safe axle. The process consists in heating the axle to the temperature at which its carbon changes to hardening carbon, and then, while it is being rapidly revolved, immersing it in a water bath, and also at the same time throwing on it a series of submerged jets. After cooling the outside the axle is removed from the bath while there is sufficient heat remaining in the interior to raise the whole mass to a low red heat and allow the carbon to change back to the non-hardening state. The main object of cooling rapidly through a certain range of temperature is to prevent a weak crystal formation.

**THE DESIRABILITY OF REGULAR MOTION FOR MACHINERY.**—It is always desirable that the motion of a machine should be regular. Even supposing that the first mover is perfectly constant and equal in its actions, the machine may not be regular in its movement, from the irregularity of the resistance to be overcome. But still, says a contemporary, if both the power and the resistance were perfectly regular, the machine would not be perfectly uniform in its motion, for there are particular positions in which the moving parts of a machine are more efficacious than others, as in the crank, for instance; hence the energy of the first mover will be unequally transmitted, and irregularity in the motion of the machine will constantly follow. The motion of some machines bears a constant tendency to accelerate, others to retard; and others alternately to accelerate

and retard; and, perhaps, in no case whatever can the motion of a machine be said to be perfectly uniform; but common sense will point out the necessity of having the motion as uniform as it can be made, else it will increase in proportion as it is multiplied through the machinery.

**A UNIVERSAL WHEEL.**—At the last meeting of the "Société d'Encouragement à l'Industrie," M. Collignon spoke thus: "The universal character of the wheel invented by M. Pichon consists in the fact that this wheel, with movable feathers, is adapted to work in air as well as in water, and according to different circumstances, it may serve for a hydraulic motor, a windmill, a meter for water or gas, a pump, ventilator, propeller, etc. It was very much appreciated when introduced to the Congress held at Toulouse by the 'Association Française pour l'Avancement des Sciences,' and several members considered that besides realizing great progress, it would prove the source of a new series of improvements to be adapted to hydraulic receivers and propellers."

**SOLDERING ALUMINUM.**—R. Angelo Ball, in *Lock and Bell*, states that aluminum can be soldered in the same manner as brass. When hard solder is used let it be an alloy of two parts pure silver and one part yellow brass. Care must be taken to avoid overheating the aluminum. It can be cast in dry or metallic molds. It can be welded by the use of electricity. This is not a recent discovery. Mr. Bell says: "I learned how to manipulate or work upon it 15 years ago. Four years ago Percival Frazer, the well-known chemist and metallurgist expert, brought to me a bunch of aluminum keys, one of them broken. I repaired it by the use of the alloy above mentioned. He informed me the keys were made at a locksmith's shop in Paris, in 1882. That they were all cast from a bunch he carried."

**ALUMINUM BRONZES.**—The results obtained in testing the new aluminum bronzes are indeed remarkable and open up a new and interesting field of research. The enormous strength of these bronzes and their lightness allow of some very important applications. Thus, the weight of propeller screws can be reduced one-third, and yet be increased in strength and elasticity. It can be used instead of steel in making guns, and they will be more effective. They can be made at one-fifth less than the cost of steel guns, and 68 per cent of the metal in them can be remelted and used over again any number of times. Heavy machinery can also be made of this remarkable metal. There is, no doubt, an infinity of uses for these new bronzes.

**COPPERING SOLUTION.**—The well-known machinist copping solution can be composed of one ounce of sulphate of copper, or blue vitriol, dissolved in about four ounces of water. The addition of a teaspoonful of nitric acid will make the solution work quicker. This solution has but little or no effect upon the brass when simply placed upon it, but put some of the solution on the place to be coppered, and in the solution hold any small piece of steel or iron, letting it touch the brass, and a very interesting thing will be soon seen. A film of copper soon covers the brass wherever there is any of the solution. The solution can also be applied drop by drop with a piece of iron or steel wire.

**HARDENING METALLIC WHEELS.**—To give a greater solidity and density to the metal for wheels, it has been suggested, while the casting is cooling, to give it a rapid rotary movement near the edge where it will ultimately work most. The centrifugal force gives the desired result, in pressing the liquid metal against the outer parts. This process, used in England by Mr. Webb, some years ago, has lately been put in practice in a Pittsburgh foundry.

**A STEM-WINDING SCREWDRIVER** has been made in Philadelphia, with the handle in two parts, said parts being capable of rotating one upon the other. A stop-pin and pawl limit the movement of the shank in one direction, while the top of the handle will move backward without turning the shank. The mechanism appears to be very similar to the principle of a stem-winding watch.

**SPIRAL SPRINGS.**—One of the rules for spiral springs, when made of round steel, is to multiply the cube of the diameter of the steel wire in inches by the amount that it is to be deflected for each coil, and this product by 75,000, then divide by the diameter of the spring, measuring from the center of the wire, and the quotient will be the force exerted in pounds.

**INVENTOR OF THE SCREW-ANGER.**—The screw-anger was invented by Thomas Garrett about 100 years ago. He lived near Oxford, Chester county, Pa. The single-screw auger was invented by a Philadelphian, and it is said to be the only one used with any satisfaction in very hard woods where the double-screw augers become clogged.

**COPPER FOR ELECTRICAL PURPOSES.**—Four of the largest manufacturers of copper wire for electrical purposes in the United States used, in 1887, 13,500,000 pounds of copper.

The United States consumes more rails and other railroad supplies than all the rest of the world.

## SCIENTIFIC PROGRESS.

## A Moral and Natural Mystery.

What a monstrous specter is this man, the disease of the agglutinated dust, lifting alternate feet, or lying drugged with slumber; killing, feeding, growing, bringing forth small copies of himself; grown upon with hair like grass, fitted with eyes that move and glitter in his face; a thing to set children screaming, and yet looked at nearlier, known as his fellows know him, how surprising are his attributes! Poor soul, here for so little, cast among so many hardships, filled with desires so incommensurate and so inconsistent, savagely surrounded, savagely fathered, irremediably condemned to prey upon his fellow-lives—who should have blamed him had he been of a piece with his destiny and a being merely barbarous? And we look abroad and behold him instead filled with imperfect virtues; infinitely childish, often admirably valiant, often touchingly kind; sitting down, amid his monetary life, to debate of right and wrong and the attributes of deity; rising up to do battle for an egg or die for an idea; singling out his friends and his mate with the most cordial affection; bringing forth in pain, and rearing with long-suffering solitude, his young. To touch at once the heart of his mystery, we find him in one thought, strange to the point of lunacy; the thought of duty; the thought of something owing to himself, to his neighbor, to his God; an ideal of decency, to which he would rise if it were possible; a limit of shame, below which, if it be possible, he will not stoop. The design in most men is one of conformity; here and there, in picked natures, it transcends itself and soars on the other side, arming martyrs with independence; but in all, in their degrees it is a bosom thought—not in man alone, for we trace it in dogs and cats whom we know fairly well, and doubtless the like point of honor sways the elephant, the oyster and the louse, of whom we know so little.—*Robert L. Stevenson in Scribner's.*

**PROOF OF THE EARTH'S MOTION.**—Any one can prove, remarks a contemporary, the rotary motion of the earth on its axis by a simple experiment: Take a good-sized bowl, fill it nearly full of water, and place it upon the floor of a room which is not exposed to shaking or jarring from the street. Sprinkle over the surface of the water a coating of lycopodium powder, a white substance, which is sometimes used for the purposes of the toilet, and which can be obtained at almost any apothecary's. Then, upon the surface of this coating of powder, make with powdered charcoal a straight, black line, say an inch or two inches in length. Having made this little black mark with the charcoal powder on the surface of the contents of the bowl, lay down upon the floor, close to the bowl, a stick or some other straight object, so that it shall be exactly parallel with a crack in the floor, or with any stationary object in the room that will serve as well. Leave the bowl undisturbed for a few hours, and then observe the position of the black mark with reference to the object it was parallel with. It will be found to have moved about, and to have moved from east to west, that is to say, in that direction opposite to that of the movement of the earth on its axis. The earth, in simply revolving, has carried the water and everything else in the bowl around with it, but the powder on the surface has been left behind a little. The line will always be found to have moved from east to west, which is perfectly good proof that everything else has moved the other way.

**PLAUSIBLE THEORY OF THE BASIS OF DIAMOND FORMATION.**—Prof. Simmler brings forward the somewhat plausible theory that the basis of diamond formation is liquid or liquefied carbonic acid. Indeed, facts observed by different savants tend to show, it is said, the presence of this agent in the coating of the most valuable gems. Upon the bursting of such crystals there are often found to occur two liquids in the cavities, the one behaving like water, the other like liquid carbonic acid. On one occasion, indeed, it was observed that the liquid in a quartz crystal which was dashed to pieces scattered its contents around with a great noise, burning holes in the handkerchief wound around the hands of the experimenter. The acid content itself had disappeared. Under these circumstances M. Simmler argues that if carbon be soluble in liquid carbonic acid, it would then only be necessary to subject the solvent to slow evaporation. The carbon would thereby be deposited, and, by taking proper care, assume crystalline forms, and in evaporating quickly the so-called black diamond, which, in the state of powder, is much used for polishing, the colorless diamond might be produced. Though the liquid in question has never been subjected to a chemical analysis, the formation of liquid carbonic acid in the interior of our globe may, it is admitted, be considered as highly probable.

**NEW APPARATUS FOR TRANSMITTING FORCE.** A French engineering professor, M. Raymond Sayers, of the Louvain university, has invented an apparatus for transmitting force between bodies moving at greatly varying velocities without accompanying disadvantage of a violent collision. The method consists in furnishing the contact surface with steel brushes, which, by the entanglement of their "bristles," are enabled to grip one another. In this way

the swiftest motion may be imparted gradually to a perfectly stationary body, and a maximum of shock can be arranged which can never be exceeded, be the impelling force and velocity what they may. The inventor has in view chiefly the requirements of quickly moving lifts, railway trains and the other bodies moving at high speed and with great momentum; and if it is possible to produce in this way an effective brake, or to obtain an automatic working of railway signals, much will be done to minimize some of the most serious perils which at present threaten life and limb to industrious occupations.

**ANOTHER USE FOR THE MAGNET.**—The magnet has long been used for various purposes in the arts. It is used for separating iron as it occurs in various forms in sacks of wheat as the grain passes on its way to the rollers or stones; it is also used to separate iron-sand from the mass of earthy matter in washing for gold. It is also employed for various other similar purposes; but the latest application is in paper manufacture. In paper-making a difficulty is experienced from the fact that iron is apt to discolor paper by rusting after it has been abraded from the paper-making machinery. Magnetism has, therefore, been called in by a German manufacturer to clear away the iron specks. A series of magnets are arranged in the form of a comb, and hung across the stream of pulp and water, which in passing the magnetic teeth of the comb delivers up the iron particles.

**PHOTOGRAPHING ON METAL.**—An Eastern photographer has devised a process for producing photographs on metal. It is said that up to the present time no one has been able to do this. The work exhibited is very pretty and very delicate. The pictures were executed on watch-cases, buttons, lockets, breastpins, and other pieces of metal. The process is a secret one and the negatives are taken instantaneously and by means of a flash light. A number of negatives of guests were taken and developed by a liquid which, the inventors of the process claim, is a vital part of the production of photographs on metals.

**MAGNETISM OF THE MOON.**—M. Ligner, an Austrian meteorologist, claims to have ascertained after careful investigation that the moon has an influence on a magnetized needle varying with its phases and its declination. The phenomenon is said to be more prominently noticeable when the moon is near the earth, and to be very marked when she is passing from the full to her first or second quarter. The disturbances are found to be in their maximum when the moon is in the plane of the equator, and greater during the southern than it is during the northern declination.

**FLOWERS AND MINERALS.**—Dr. R. W. Raymond lately called attention to the reputed connection between certain plants and the metals in the underlying soil. Thus the zinc violet or *Galmeyveilchen*—sometimes regarded as a distinct species under the name of *Viola calaminaria*—points out the hills containing calamine, or zinc ore, in Rhenish Prussia and Belgium. The lead plant, *Amorpha canescens*, is believed by American miners to grow only in localities containing galena, and *Eriogonum ovalifolium* is probably destined to be known in the West as the silver plant.

**ELECTRIC EARTH CURRENTS.**—M. J. J. Landerer has been engaged in the study of electric earth currents, and has obtained some interesting results. By means of a line-wire having an azimuth S. 54 deg. W. in relation to the magnetic meridian, he finds that the currents travel from six to seven times southwest to northeast for once that they travel in the contrary direction. On many days they change in direction several times, especially during great atmospheric disturbances. These observations were made with a Deprez galvanometer and extended over nine years.

**DOES THE MOON INFLUENCE EARTHQUAKES?** Observations on the part of a large number of scientists prove that earthquakes are more frequent at the time of full moon and change of the moon than at other times, and also more frequent when the moon is nearest the earth or when she is on the meridian. The cause to which this fact has been assigned is the action of those forces which produce the tides of the ocean; their similar influence upon the solid land strata leads to their disturbance in the shape of earthquakes.

**AN INTERESTING EXPERIMENT WITH WATER.** The apparent paradox that the most transparent water is at the same time perfectly opaque from a certain point of view is shown by a simple experiment. Partly fill a glass goblet with clear water, and hold it a little above the level of the eye and distant a foot or more. No object can be seen when held just over the surface of the water, but the water surface appears like a burnished mirror.

**THE CONSUMPTION OF POWER.**—It has been ascertained that the horse-power required to run a machine-shop, in which 700 men were employed, was 135.05, of which 66.81 horse power was required to run the shafting, blowers and such things as were not machine tools, leaving 68.24-horse power to run the machine tools, or a trifle less than one horse power for ten men.

## GOOD HEALTH.

## The State Medical Association.

## The Cancer Discussion.

The State Medical Association held its 18th Annual Meeting in this city last week. Among other matters considered was a report from the Committee on Medical Legislation, suggesting several matters for special legislation, some of which would, no doubt, be very proper. According to the report of a morning paper, cancer formed a leading topic of discussion on Wednesday. Dr. W. E. Taylor of this city is reported as remarking that in the removal of cancer from 604 patients, of which mention has been made, 238 died, which the speaker declared to be very great mortality. The immediate mortality by removal of the tongue for cancer is comparatively small.

A discussion on the subject followed, being opened by Dr. Thomas W. Huntington, who is in charge of the railroad hospital at Sacramento.

He said that it was about time a halt was called on indiscriminate surgery. The lawgivers of surgery were not always surgeons.

Another surgeon from one of the interior counties enumerated several cases of cancer which he had treated. One case was that of a young woman who had cancer of the breast. He told her that she could only live 12 months if an operation was not performed, while she might exist for three years if the operation was made. She consented to the operation. This was a couple of years ago. A short time since she sent for him and he found that a cancerous deposit had formed again. She asked him if she could be cured. He told her that he could cut her body in two, and that in that way the lower portion might be saved; that was all he could do for her.

This side-splitting anecdote, and several ones like it, was received with much laughter. The speaker believed that there was no one whatever for cancer.

We submit that such a grave body as the State Medical Association ought to find some other matter for hilarity than that indicated above. We fully agree with Dr. Huntington that it is about time a halt was called on indiscriminate surgery, referring, as he evidently did, mainly to cases of cancer. We further submit that the matter of indiscriminate surgery in cancer cases might well be included in the matters for legislation called for by the association.

He said Dr. Lane differed from Dr. Huntington. He said that out of 88 cases of cancer which he had watched, four-fifths had recovered. We suppose the doctor referred exclusively to treatment with the knife. If so, it is certainly a most remarkable statement. We have been repeatedly assured by physicians and surgeons of undoubted standing in this city and Oakland that one case in 15 or 20 saved by surgical operation is considered a good average. The above statement can scarcely be received, even by the most credulous, without verifying facts. We venture the assertion that instead of saving 80 per cent by the ordinary treatment of the profession by knife, etc., not more than 10 per cent can be verified by statistics. If we are wrong, we should be pleased to publish any statements correcting these remarks which may be properly verified.

## Cancer on the Tongue.

Dr. W. E. Taylor of this city, in his reported remarks at the late Medical Association meeting, said that "the immediate mortality by removal of the tongue for cancer is comparatively small." We presume what was really said was, "removal of the cancer from the tongue." The mortality of such cases is undoubtedly "small," but the favorable results or permanent extirpation of the cancer is much smaller.

In regard to such removals we have before us a very interesting letter from Mr. Phil. R. Smith, of Victoria, British Columbia, addressed to Mrs. Dr. Cook of this city, who writes under date of April 1, 1888, as follows:

"The tongue has not troubled my wife now for the past two weeks; but previous to that time I was somewhat afraid, from occasional pains, of the cancer returning. I am now satisfied with the result and the patient way in which you worked with it. You have done more than I dared to hope for." The letter concludes with many thanks for the successful treatment of this case of cancer on the tongue.

The above case was one which was pronounced unmistakable cancer by several physicians of Victoria. Before submitting herself to the treatment of Mrs. Cook the cancer had been twice removed by the knife, and once burnt out with caustic, but it making its appearance for the fourth time induced her to try some other treatment, as above noted. We once more repeat our honest belief that the use of the knife for the extirpation of cancer is barbarous and ought to be made a subject of legislation. We have given in these columns abundant reason for our belief that cancer can be cured by constitutional treatment without either knife or

canstic, and again challenge any rebuttal of the evidence which has been published in these columns. If the Medical Association, which met in this city last week, had appointed a committee to investigate this matter, we believe it would have resulted in more good for the profession and for humanity than all which that body, as such, has done for years. But we suppose that suffering humanity and medical progress will have to stand aside to do reverence to an antiquated and barbarous code of medical ethics which has come down from the dark ages, and which is a bar to any investigation of any medical discovery outside of the profession until public opinion actually forces such discoveries upon their attention and practice, as it has done in numerous instances and eventually will do in this.

## Health of the State.

The report of the State Board of Health for March shows a very satisfactory condition of immunity from disease and death. The fatalities from 87 cities and towns with an estimated population of 734,000 were but 1066, or 1.4, per thousand.

Smallpox is rapidly dying out. Fifteen deaths from that disease are reported for the entire State, only four of which occurred in San Francisco.

Reports of sickness from 99 localities indicate a very favorable diminution of diseases throughout the State for the past month. This is especially noticeable in acute diseases of the lungs and inflammatory affections of the bowels.

Diphtheria during the month is reported as having exceeded its former boundaries, and invaded localities where it has not heretofore been prevalent. The general conclusion in regard to this disease, according to the report before us, is, "that it is a specific poison, not depending on defective sewerage or sewer gas, as we find it in localities without sewers, as well as in those well sewered; among the rich as well as among the poor; in cities, and in remotely isolated dwellings. The disease is communicable, and can be carried long distances by infected persons, clothing, and railway cars. It can only be arrested, or at least restricted, by the thorough disinfection of the persons and premises of those in contact with the dread disease. It should, therefore, be legally incumbent on every person to give notice of the disease whenever present on their premises, or in their families. We hope such a law will be enacted in our next Legislature.

The dreaded disease of cancer claimed 17 victims in this city alone during the month.

## USEFUL INFORMATION.

## Soapstone Against Rust.

Frank C. Goodall, surveyor of shipping to the Trinity House, Richmond, London, writes to *Iron* as follows: I have for some time experimented with a material called Chinese soapstone as a substitute for the ordinary metallic pigments used in paints, and I have found this soapstone to possess qualities highly calculated to prove an effectual remedy against this danger of rust. In China, soapstone is largely used for preserving structures built of sandstone and other stones which are liable to crumble under atmospheric influences, and the covering of powdered soapstone in the form of paint on some obelisks in China, which were hewn out of stone liable to suffer under atmospheric influences, has been known to preserve the same intact for hundreds of years. Soapstone may, therefore, be said to have extraordinary qualities in withstanding atmospheric influences which have a great deal to do with the corrosion of steel and iron, for it is well known that the inside of a steamer, which is not exposed to the incessant action of salt water, like the bottom, corrodes very much more quickly than the outside. Soapstone has, however, another quality which eminently adapts it as a protective paint on ships, and that is the extreme fineness of its grain. Ground soapstone is one of the finest materials which can be produced, and from the experiments which I have made I have found nothing to take hold of the fiber of iron and steel so easily and firmly as soapstone. It is, moreover, lighter than metallic pigments, and, if mixed as a paint, would cover a larger surface than zinc white, red lead or oxide of iron.

PHOTOGRAPHY AND FORGERIES.—Dr. Jeserich of Berlin has enlisted the services of photography in an important field. He employs it in the discovery of forgeries in documents. Recently he photographed an entry in a ledger handed to him by the public prosecutor as suspicious. As the event proved, the forgeries had been made with a bluish ink, which appeared very indistinct in the photograph taken, while the original entries, which had been written with a black ink, came out sharply defined. Subsequent chemical examination of the portions of the writing which the preliminary photographic test had disclosed to have been forged fully confirmed the discovery made. In a second case, it was necessary to establish certain forgeries in a check. Photographic aid disclosed the fact that the month of *Mai* (German for May) had been changed to "April" by converting the second down stroke of the capital letter *M* into a *p*, transforming the letter *a* into an *n*, and adding an *l*. The

great value of these photographic determinations consists in enabling the expert to supply direct proof in support of his opinion by submitting accurate reproductions, while chemical examination furnishes merely more or less circumstantial evidence. Moreover, in employing photography the exact picture of the document forged is preserved, while by chemical examination the object is sometimes completely destroyed.

HOT WATER FOR PLANTS.—It is a fortunate circumstance, says *Vick's Magazine*, that a plant will endure a scalding heat that is fatal to most of its minute enemies. Water heated to the boiling point, poured copiously over the stem of an enfeebled peach tree, and allowed to stand about its collar, will often have the happiest restorative effects. Trees showing every symptom of the yellows have often been rendered luxuriantly green and thrifty again by this simple means. The heat is presumably too much for the fungus which has infested the vital layers of the tree, immediately under the outer bark. The London florists recommend hot water, up to 145° F., as a remedy when plants are sickly owing to the soil souring—the acid, absorbed by the roots, acting as a poison. The usual resort is to the troublesome job of repotting. When this is not necessary for any other reason it is much simpler to pour hot water freely through the stirred soil; it will presently come through tinged with brown. After this thorough washing, if the plants are kept warm, new root points and new growth will soon follow. A lady friend had a fine calla in a three gallon pot which showed signs of ill-health. On examination the outer portion of the filling was found moldy, in being in large part fresh horse manure. As repotting was inconvenient, the plant being in flower, hot water was freely used; it killed the mold, and the plant began to revive and was soon all right.

GALVANIZING WIRE CLOTH.—Heretofore the range of applicability of galvanizing wire cloth has been limited, eight meshes to the inch being about the finest grade capable of being done satisfactorily, because the meshes filled up with the coating metal. Mr. Benjamin Scarles, Sr., of Clinton, Mass., has, during the past ten years, been carrying on a continued series of experiments, with the object of overcoming the drawbacks incident to galvanizing, the result of which has been a process yielding the well-known silver finish. As ordinarily carried out, galvanizing has the tendency to impair the ductility and tenacity of the wire and produce what is termed "rottenness." This Mr. Scarles has overcome, and he has succeeded lately in galvanizing the finest wire, samples of which have been submitted to us, and which appear fully to bear out his claims. Another very interesting product is wire cloth, as fine as 50 meshes to the inch, coated perfectly without filling the meshes. Mr. Scarles is now putting down a plant on a large scale for the Clinton Wire Cloth Co. for producing galvanized fine wire and fine-mesh wire cloth.

A NEW IDEA IN PAVEMENTS.—A newly patented pavement is said to have been suggested by the surface of an elephant's tooth, which consists of intermingled layers of hard and soft material, so that the process of wearing always produces a series of ridges upon the surface. The new system of paving is the idea of Mr. Raynard, the English astronomer, and comprises the use of blocks having alternate hard and soft layers, such as Portland cement and a mixture of sand and cement, which are set upon edges so that the edges of these laminae form a wearing surface. The blocks are made four inches high, and may be worn to less than an inch without becoming smooth, like granite blocks.

STRENGTH OF WET AND DRY ROPES.—According to experiments mentioned in *Indian Engineering*, the tensile strength of a wet rope is only one-third that of the same rope when dry; and a rope saturated with grease or soap is weaker still, as the lubricant permits the fibers to slip with greater facility. Hemp rope contracts strongly when wet, and a dry rope 25 feet long will shorten to 24 feet on being wet.

LOCOMOTIVE SPEED.—The *Engineer* says there is no properly recorded instance of a locomotive ever attaining a greater speed than 80 miles an hour, and quotes Charles R. Martin as saying that higher speeds are mythical. Back pressure, and various resistances, including that of the air, will, our cotemporary concludes, prevent a speed higher than this being reached.

A CURIOUS ALLOY.—Put into a clean crucible an ounce of copper and an ounce of antimony; fuse them by a strong heat, and pour the alloy into a mold. The compound will be very hard and of a beautiful violet hue. This alloy has not yet been applied to any useful purposes; but its excellent qualities, independent of its color, entitle it to consideration.

QUICK WORK.—In Augusta, Ga., a tree felled in early morning was before nightfall of the same day converted into paper and sent out hearing the current news.

AMERICAN PATENTS.—The United States Government granted 21,378 patents during the year 1887.

## Remarkable Railroad Activity.

For the last six or eight months the country has witnessed the remarkable spectacle of nearly all the principal lines of railways, and especially the continental railways, being unable to handle the great rush of passenger and freight traffic which is being presented. The remarkable travel westward and the consequent movement of freight in the same direction has completely halted the efforts to dispose of it with any reasonable degree of promptness. Railroad managers early foresaw a large increase of business, and immediately went to work to prepare for this by ordering large numbers of new locomotives, cars, etc.; but the increase has been so much larger than could have been anticipated that the roads nearly everywhere still find themselves overcrowded with business. So great has been the rush that for months there have been freight blockades almost everywhere, and such long delays have unavoidably occurred, that in some instances freight shipments to California from the East have been detained fully three months beyond the time at which delivery should have been made.

## The Future Still Perplexing.

The railroad companies are everywhere redoubling their exertions to meet this continually increasing traffic. We see it stated that fully twice as many passengers are coming westward at this time as were coming a year ago, and all the evidence indicates that this rush will largely increase for the next year at least. Indeed there does not appear to be any evidence of a "let-up" for years to come. There is good reason to believe that the only limit of the movement in this direction will be the means of transportation.

To meet this and the demands in other localities, all the locomotive and carshops in the country are working to their utmost extent to fill the orders for rolling-stock, while two or three new lines of travel across the continent are in active contemplation or actual construction. The Southern Pacific has been constantly adding to its rolling-stock for the last ten months, both from their own and from Eastern shops.

They have at this time orders in Eastern shops for no less than 175 locomotives, and nearly all these orders have been sent in within the last three months. In order to relieve the present pressure, efforts have recently been made to purchase locomotives already constructed, but not such as they really desire. Mr. Huntington recently secured five large 10-wheel engines of this class and telegraphed the fact to Manager Towne, who, in speaking of the fact, said his only regret was that the number was not 25 instead of five. During the past year the Southern Pacific Co. has been extensively engaged in building locomotives at its Sacramento shops. The company has recently ordered 20 light switch engines to be used at their principal stations on this coast—at Los Angeles, San Pedro, Mojave, Oakland, San Francisco, Port Costa, Lathrop and Sacramento.

More cars will be built in the United States this year than ever before in any one year. As it requires two tons of bar iron and three tons of wheels and axles for each car, the demand for the products of the mills, foundries and forges will be very heavy for this purpose alone. It is estimated that 200,000 cars will be built. This number would require 400,000 tons of bar iron and 600,000 tons of forged and cast iron, making a total of 1,000,000 tons.

## The Demand for Rails

Is also exceedingly large. It was not long ago that the Southern Pacific contracted for 42,000 tons of steel rail, yet C. P. Huntington has recently given orders for 25,000 additional tons for use in building the branch lines in this State. Of the first contract about 20,000 tons have already arrived. Most of the former order had to be given to foreign mills on account of the scant American supply. The recent order, however, will be filled by the Eastern mills. A good many of the new rails weigh 62 pounds to the yard, while the others have a weight of 72 pounds.

Col. Fred Crocker is authority for saying that the Southern Pacific has had, until within a few weeks, over 40 different parties of surveyors at work in various sections of the State, and that they now have maps, profiles and located lines in every district where there is the slightest prospect for a railroad line. Ere this goes to press Mr. C. P. Huntington will have arrived in California, where he will remain some three months to take a general view of the wonderful degree of activity which is now in progress in this State, and to look more thoroughly into the need which now exists and which in the early future will call still louder for additional branch roads.

STEAM ECONOMY.—It is quite generally acknowledged that in the prevention of condensation in the cylinders of a steam engine lies almost the only hope of further augmenting economy. Not only is this true, but it is also certain that by preventing internal condensation not a little, but a considerable, loss would be avoided. The mode of action of steam in say, a triple-expansion engine is very curious. It is entirely different from that of any other working fluid, such as gas or air, and it has little or nothing in common with the theoretical action of the ideal fluid as elaborated by the mathematician and the physicist.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**REED AND ASKEY.**—Amador Ledger, April 21: The Reed and Askey mine and mill are kept running pretty steadily. The property is located near Irishtown, some seven or eight miles above Jackson. The mill is only five stamps, and very light stamps at that, crushing on an average less than a ton to the stamp per day. The ore yields between \$8 and \$9 per ton. Rock is taken from a tunnel and the ledge is three feet wide. It takes four men to run both mine and mill.

**ZEILE.**—The Zeile mill has been idle most of the week, on account of some repairs which are being done to the machinery at the hoisting works; putting up a new foundation for the engine, etc. At the old Kearsog mine, above Big Bar bridge, the tunnel is in 70 feet, running in a northerly direction; the face is in a hard formation. It is thought it will take 200 or 250 feet further to reach ledge matter. At the Cleveland they have just finished a cleanup of 60 tons, which we are informed yielded between \$10 and \$11 per ton in free gold. The mill has been shut down until either concentrators are put in or five more stamps added. They intend to sink both shafts 100 feet deeper and work to this end has already been started. This will give the old shaft a depth of 220 feet and the new shaft 120 feet. At the Riverside mine, north of the Cleveland, men are engaged in cutting a ditch from the Amador canal so as to pipe the surface with a giant, with a view of exposing the rich pockets which exist in that claim. They have taken out \$500 lately by simply panning out. Twenty stamps of the Kennedy are again in motion. A late cleanup at the Live Oak mine, near Stony creek, yielded \$2000—a highly satisfactory result from two stamps. Work at the big tunnel at Middle Bar has been entirely suspended. The Moore mill was started last Saturday. There is over 200 tons of ore to be crushed, which will keep the mill running eight or ten days. It is reported that the refuse dump will be crushed also.

## Calaveras.

**AT MURPHYS.**—Calaveras Prospect, April 20: The Oro Plata is quiet—no one at work at present. Owners from the East will visit the mine soon, when it is expected a new order of things will be brought about. It is a serious blow the closing down of the works, but we opine it will not be for a long time. Another mine will start up in the Stanislaus district, owned by San Francisco parties. A lot of machinery for Tom Goodwin's mill was sent to the river to-day.

**QUARTZ.**—A gentleman by the name of Matteson, from Angels, has recently purchased a quartz mine from Wm. Sanderson of Railroad Flat. The claim is located between Clark's place and the town of Railroad Flat, and is a continuation of the Poe lead. The rock is being taken to an arastra on Wet gulch, where it is milled. Some excellent rock has been run through the mill lately, and the owners are well pleased with the present outlook.

**ANGELS OUTLOOK.**—Mountain Echo, April 18: The quartz mining outlook for Angels and vicinity is brighter than any section to the mining regions of California. Extensive works are being put up on several mines here, and the ore now being extracted from nearly all of them mills large returns, besides, the ledges are wide and extensive. Without a doubt, the summer and autumn months will be livelier in this section than any time within the past 20 years.

**THE TIBERGHEIN MINE.**—Work has been resumed on the Tiberghien mine, situated about a mile west of this town. The mine has recently been booded to Mr. Chas. J. Nickerson, owner of the celebrated Gold Cliff mine. A force of men is now engaged in sinking the shaft which is at present about 35 feet deep. Work is kept up night and day. The ore now being extracted is immensely rich in sulphurets, besides carrying free gold. The ore will, we are informed, be crushed in the Gold Cliff mill. New Frue concentrators will soon be erected at the mill by which process the sulphurets will be saved. The shaft will be sunk 100 feet before levels will be run.

## Fresno.

**SYCAMORE DISTRICT.**—Cor. Fresno Republican, April 14: The Sycamore district is situated about 50 miles from Fresno in an easterly direction, and is an inexhaustible field of mineral wealth. While it has not been even prospected yet, some good locations have been made and are being developed. The Stone Wall mine, belonging to James Musick, for the amount of development, bids fair to prove an extremely valuable property, with vein matter averaging from two to three feet. Assays of ore taken from their present workings indicate rich returns when the rock is milled. Immediately adjoining the Stone Wall is the American Flag, recently located by Kavanaugh & Hart. Pieces of float quartz found along the surface cropplings varying in size from 10 to 200 pounds show free gold in liberal quantities. The most extensively developed mine in the district is the Providence and Richmond Consolidated, perhaps better known as the Musick, and concerning which so much has already been said or written. The incline shaft formerly sunk to a depth of 75 feet on a continuous chute of \$30 to \$40 free gold ore, averaging in width from 18 to 30 inches, has, at a point about 20 feet deeper, encountered a five-foot vein showing an increased amount of gold in about the same proportion to the increased size of the vein. The lower level, intersecting the incline shaft at a distance of about 25 feet above the bottom, and thence running 90 or 100 feet in an easterly direction, has opened out into a three-foot vein of soft red ore interpersed with bunches of bright, lively, free, gold-bearing quartz, with every possible indication of a steady and rapid increase in size and quality of ore deposit. Aside from the property mentioned, and further eastward on the same mineral belt are several fine properties, especially on and near Dinkey mountain. During the month of October last, James Musick, a prospector, whose name as such is co-extensive with the Western States and Territories, while prospecting in the above vicinity, met with his usual good luck, discovering a mammoth gold-bearing ledge with surface diggings immediately below and contiguous

thereto. From pan prospects alone he realized \$1 per hour, but owing to the lateness of the season and the heavy fall of snow which occurred about that time he was compelled to abandon the claims until the coming spring, when he intends to resume operations. Considering the natural advantages to be found in this district as regards timber and water, in addition to its close proximity to railroad facilities, there is every assurance that the time is not far distant when Sycamore district must come to the front as one of the most prosperous mineral districts in California.

## Inyo.

**A GOOD MINE.**—Inyo Index, April 18: Mr. J. G. Birchum of Round valley is in town. He tells us that the Dark Horse mine, recently purchased by Mr. Wm. Charles for an English company, is developing splendidly—even better than was anticipated. At present 16 men are at work, but it is probable that 150 men will be put in the mine within a few months.

**SODA WORKS.**—Inyo Register, April 20: The Soda company has stopped the work of excavating vats on the shore of Owens lake, having a sufficient area cleared for present purposes. The enterprise has come to stay, nevertheless.

## Nevada.

**THE DRIFT MINES.**—Nevada Herald, April 21: Superintendent Richards of the Centennial drift mine is in town. He says the work of pumping out the mine is progressing rapidly. No caves seem to have occurred, and the mine will soon be ready for a full force of hands to drive into the channel. Mr. Richards says the item going the rounds that Pelton wheels are used at the Centennial, is wrong. The Richards wheel is what does the work there, and it does it successfully. At the San Jose they are still sinking, being down now about 235 feet. They have about 35 feet still to sink before they expect to reach the channel. It will be quite lively on that part of the ridge this summer, and if such ground is struck as is expected, there will be quite an excitement. There are good drift gravel mines on different parts of Washington ridge.

**FIRE-CLAY.**—Grass Valley Tidings, April 24: The very best fire-clay that can be had here by our foundrymen grows, the clay does, right in our town. Mr. Lakenan informs us that he has for years used in his foundry the clay that comes from the diggings of Reuben Thomas, in the northern part of town, and that this clay stands heat better than any other. And, therefore, could not fire-brick be made here of that same clay? The things of use that are right here among us are not yet half known. There does not seem to be good sense in importing here and paying freight on articles that grow here.

**WASHINGTON.**—Cor. Nevada Herald, April 18: We enjoyed a visit up the river last Saturday. Found Ole Hengerson's mill at the Daylight ledge in running order. It is a neat little four-stamp mill and is rigged up as complete as any of the large mills. The Yuba and Blue Bell are running full blast.

## San Bernardino.

**DAGGETT IRON ORE.**—Chino Valley Champion, April 20: Mr. W. E. Judson, the iron expert, made a call at Chino this week. He recently inspected the iron deposits at Daggett, and like a fair man with a reputation of value, he remained long enough to learn all that he could without practical development. He found a vast amount of ore of high quality, and is convinced it can now be utilized at a profit. His report that San Bernardino county contains immense quantities of iron ore, is one of value. The attention of iron manufacturers throughout the country has been called to the iron ores of San Bernardino county.

## Shaeta.

**SQUAW CREEK.**—Redding Free Press, April 21: L. Gross reports that the mines of Squaw creek are looking well. He says that Jack Conant has an abundance of rich ore in sight, and that he is working his mill and mine systematically.

**FRENCH GULCH.**—From P. Gleason, who has been employed in W. T. Coleman's mines in French gulch for the past eight months, we learn that things are booming there. In the Niagara, between 80 and 90 men are employed. There are about 30 men in the Shafter and Scorpion mines. The Merchant Prince is gradually absorbing the whole of the gulch, reaching over into Trinity county for a slice of Deadwood. From Geo. Swett, who came down from Squaw creek yesterday, we learn that the Riley & Bliss mine is employing between 20 and 30 men, and that their ten-stamp mill is in constant operation with satisfactory results.

## Sierra.

**RICH GRAVEL.**—Sierra Tribune, April 20: Thos. Carlett, who is mining in Tennessee ravine, near Poker Flat, recently encountered gravel which pays all the way from 50 cents to \$7 a pan. There is no denying the fact that Northern Sierra contains more rich deposits of gold in gravel than any other portion of this earth, and it is the opinion of the Tribune that the drift gravel mining industry is only in its infancy. The wealth is there, and eventually men who already possess capital will seek in the hills for more.

## Siskiyou.

**BLACK BEAR.**—Yreka Union, April 20: Mr. Pat Doran, who was in the city yesterday on his way to Shovel creek, Hot springs, informs us that the Black Bear mine is looking fine and that 16 stamps are running. He says that Mr. Daggett has just completed his narrow-gauge railroad from the mine to the mill, a distance of two miles. This dispenses with all teaming. Rock from the Mystery mine, owned by Daggett & Pierpont, is being crushed at the Black Bear mill and the amalgamator. Mr. English says it is yielding at least \$40 a ton. At the mine a 400-foot tunnel is being run which will tap the ledge at a depth of 80 feet.

## Trinity.

**NEW RIVER.**—Trinity Journal, April 21: Mr. J. W. Shuford was in from New River this week on his way to Trinity Center. He informed us that the camp is in a prosperous condition, and a great number of mining men are expected to take up their abode there this summer to aid in developing the mining industries of the camp. There are now about 4 miles of wagon-road in the district. The sawmill is doing good work, and all parties desiring good lumber can obtain the same at reasonable rates. The Excelsior, owned by Mr. Colgrove, is looking well and there is a large body of ore in sight.

The mine is good property. The Mountain Broomer has developed into a permanent mine, the ledge now being of good size and shows ore sufficient at least for two years' crushing. The Ridgeway is looking well, but very little work is being done at present; operations will begin in earnest soon. The Uncle Sam has been tapped at a depth of 170 feet by a tunnel, and all above this is good ore and will be stopped out during the summer, or as much thereof as can be handled. Hely's mine and Sherwood's are pleasing the owners, and will, without doubt, prove to be of considerable value within a short time. Nearly all the other mines are showing favorably, and work on them will be pushed this season. Roff & Hagena have discovered a good prospect and are getting ready to develop it into a mine, and have planned for building an arastra. New locations are filed frequently, which shows that there are many who have confidence in the richness of the quartz deposit, and that they are willing to wager money and their time that it will pay to work. No pack-trains have come into the camp this season, but they will soon run regularly, when the miners will be furnished with all things needed that are capable of being packed. The miners of New River district held a meeting recently to arrange for the employment of a physician and surgeon to reside there. It was agreed to levy a *per capita* tax of sufficient sum to give the physician a reasonable salary and accord him the privilege of practicing outside the camp.

**THE HARDCRABBLE.**—Trinity Journal, April 21: The owners of the Hardcrabble mine in the East Fork mining district are fast developing a good mine. A shaft is being sunk by contract and has reached a depth of 65 feet. The ledge at the surface is about an inch in thickness; at the bottom of the shaft it has widened to nine inches and is very rich in free gold, and carries extremely rich sulphurets. Mr. W. S. Lowden has recently surveyed it for a patent. The owners of the property are Messrs. Jas. Addie, and John Wallace and Dr. C. W. Spratt.

**KNOW-NOTHING CREEK.**—At present there is a scarcity of miners in camp; several more are wanted. The Hansen Mining Co. are still running a tunnel on their ledge and taking out considerable ore. The current rumor is that they will soon erect a mill. The Gold Run Co. are now working double shifts on their mine. Their mill is running steadily and they say everything is prosperous. The Know-Nothing Co. are still driving tunnels on their ledge and doing other development work; they expect to have a mill running by next fall. Clark & Dulybon are developing the Wolverine mine on Poverty creek; they say things look very promising.

## Tuolumne.

**GOOD ORE.**—Sonora Democrat, April 21: The Belcher mine, near Groveland, of which Mr. Louis Blanding is the manager, has developed a two-foot ledge of good ore. The Black Oak mine at Soulsbyville employs 60 men, the Gilson and Platt 16, and Soulsbyville is full of enthusiasm and brilliant hopes for a permanent welfare. The mine of Louis Stonicker and the Peferia Bros., near Tuttletown, is doing well; the ledge is from 2 to 25 feet in width and will average \$8 per ton. A company has taken hold of the Raymond & Gilson mine, near the Gilson and Platt lead. Mr. Pomeroy Easton has started up his five-stamp mill on ore from his mine at Arastaville. We are told that a considerable quantity of the rock already out will pay \$70 per ton. There is about 40 tons of that ore on the dump. The lead is not large, but it is of sufficient proportions to justify a larger mill. Messrs. Thos. H. Skaggs and E. F. McFarhan of Mormon creek have just discovered some very rich gravel in their claim on Table mountain. They had run a tunnel in the mountain through the gravel, and recently, in order to determine the extent thereof, they ran some drifts. The gravel strata are thought to be very extensive and prospect richly. There are many mining men in Sonora at present looking at properties in this county. We are having a kind of a mining boom here, and now is the time for all parties who have mining properties of real, substantial merit to develop them, for capital and energy would soon be attracted to them. Mr. P. W. Scott has resigned his position as superintendent of the Black Oak mine, and the company has appointed William Sharwood, mining engineer, to the superintendency thereof.

**EAGLE.**—Tuolumne Independent, April 21: At the Eagle mine, 14 miles east of Columbia, on Eagle creek, the owners have developed a very fine piece of property. The tunnel is in about 250 feet; and 160 feet below the surface, on the pitch of the vein, the rock is extremely rich. A three-foot vein has been uncovered, the rock prospecting in the neighborhood of \$30 a ton.

**BONANZA.**—In round numbers, \$30,000 has been taken out of the pocket struck in the Bonanza mine about three weeks ago, and has been sent below. There is two or three tons of refuse now being worked at Ferguson's mill, at the water works. Besides this, there is a lot of waste rock, sand and siftings to be worked up, which will doubtless bring the total yield of this pocket close on to \$37,000. This strike was made on the footwall, some 150 feet from the surface, and a short distance, on the same wall, from the \$60,000 pocket taken out about a year ago. The big strike of several years ago was on the hanging-wall—the two walls being separated by about six feet of debris, slate, etc. It is hoped to strike another pocket soon, as the indications point to another deposit a few feet further on from where the present ore was found. And so it is being proved, day by day, that the mining industry of this county is yet in its infancy.

## NEVADA.

## Wahoe District.

**BULLION.**—Virginia Enterprise, April 21: Opened a station on the 640 level and have commenced crosscutting east.

**CROWN POINT.**—The upraise from the east crosscut on the 500 level to connect with the 400 winze is up 32 feet. Work in the east crosscut has been suspended until this connection is made. The south drift on the 600 level was advanced 20 feet; total length, 451 feet. The west crosscut was advanced 30 feet; total length, 140 feet. The face shows some quartz, giving low assays. The Suro tunnel drift has been stopped, and connection will be made with it from the Suro tunnel side.

**SAVAGE.**—On the 400 level the south drift has been advanced 22 feet and continues in ore that

averages, by assay, \$30 a ton. The southeast crosscut from this drift has been extended 34 feet, making its total distance 74 feet. Are extracting ore from the several levels between the 400 and 900 stations, and are shipping to the Rock Point mill about 70 tons per day, the battery samples of which average \$31 per ton. Have bullion on hand amounting to \$22,000.

**BEST AND BELCHER.**—On the 425 level upraise No. 2, near the north line, has been carried up 10 feet. At the top of this raise have cut out a station and started a west crosscut. The formation is quartz and porphyry. The winze at a point 50 feet south of upraise No. 2 has been sunk 24 feet; total, 40 feet. The formation is quartz, showing some value by assay.

**CHALLENGE.**—The joint Challenge and Yellow Jacket north drift on the 1000 level was run during the week 41 feet; total distance, 272 feet. This drift is now connected with the Confidence Challenge raise. By this connection good ventilation is obtained for the Confidence and Challenge mines on the 1000 level.

**CONFIDENCE.**—The winze is now down a distance of 32 feet, having been sunk 12 feet during the week. The bottom shows fair ore. We are now shipping daily to the Brunswick mill for reduction 180 tons of ore, the average battery samples of which show a value of \$42.70 per ton.

**HALE AND NORCROSS.**—From the 600 and 700 levels are extracting the usual amount of good ore. During the week have hoisted 1587 tons, and have shipped to the Nevada and Mexican mills 1505 tons. Have bullion on hand and previously shipped this month amounting to \$70,000.

**OCCIDENTAL.**—In the lower tunnel, 75 feet south of the north incline winze, the incline upraise has been carried up 10 feet; total 35, and 15 feet south of the north incline winze. The south drift has been carried 4 feet; total, 72. Extracted 28 tons of fair-grade milling ore.

**KEYES.**—The south drift on the 240 level has cut through a laminated clay 5 feet thick and course has been altered so as to crosscut the vein. Face now in soft vein porphyry showing some metal.

**ANDES.**—Have just started drifting east on the 350 level. The face is in quartz. Are still drifting north on the 240 level in low-grade ore, with occasional spots of rich stuff.

**GOULD AND CURRY.**—Have extracted during the week 100 tons of ore from the 250 and 300 levels of fair-grade milling quality, which has been stored in drifts to the mine.

**CHOLLAR.**—The main incline from the Chollar shaft is down to the Suro tunnel level. North drift No. 2 on the 450 level is in 471 feet in low-grade quartz now.

**POTOSI.**—The south drift on the 550 level is in 426 feet in quartz and clay now. The southwest drift on the 450 level is in 315 feet in clay and porphyry.

**SEGREGATED BELCHER.**—The south drift on the 1300 level being in bad condition, we are now engaged jointly with the Belcher Co. in thoroughly repairing it.

**ALPHA.**—The north lateral drift on the 382 level is in 178 feet, and the winze 100 feet from the Alpha shaft on the 382 level is down 50 feet.

**UTAH.**—The west crosscut from the top of the upraise has been extended 45 feet; total, 90. The formation is quartz, showing valuable assays.

**YELLOW JACKET.**—There is a west crosscut started on the 1100 level, near the north line, which is showing ore of good value.

**IOWA.**—Have put in and repaired 450 feet of water-pipe from the flume down to the McBee tunnel.

**WEST CON. CAL.-VA.**—Sinking shaft and passing through mineralized vein quartz.

**OVERMAN.**—Shipping 40 tons of ore daily to the Vivian mill. It is of fair grade.

**ALTA.**—Mill running steadily on ore from the 1150 and 825 levels.

**BALTIMORE.**—Are still at work putting in the new pump.

## Cory District.

**ARASTRA.**—Esmeralda News, April 21: Tobe Crossman will start up his arastra in a few days. He has 20 tons of \$50 ore on the dumps of the Gertie, Ollie and Golden Eagle mines, that he intends running through it. The mines and arastra are situated in Cory mining district, about a mile above the town of Coryville. Men will be put to work on the mines within a few days to take out the ore that is now in sight and to further develop them. Tobe expects to keep his mill, which can crush about three tons per day, at work all summer.

## Ely District.

**ELY.**—White Pine News, April 21: The Ely Gold Mining and Milling Co. shipped this week three bars of gold bullion, valued at \$2485. This amount was produced from 212 tons of ore, an average of about \$11.40 per ton. The amount being lost in the tailings is said to reach \$75. We hope the company will be able to save the greater part of this loss after thorough experimenting. If they can, they have a good property.

## Eureka District.

**ORE SHIPMENTS.**—Sentinel, April 21: During the past week ore shipments were made from the mines of the district as follows: To the Eureka Con. Reduction Works—Margueretta mine, 13 tons; Summit, 12 tons; Altoona, 5 tons; Dunderberg, 40 tons; Geddes & Bertrand, 10 tons; Standberg, 16 tons; Silverado, 1 ton; Williams, 11 tons; Richmond Works—Lincoln, 16 tons; Dunderberg, 41 tons; Geddes & Bertrand, 18 tons; Jackson, 52 tons; Williamsburg, 6 tons; May Lode, 12 tons; Idaho, 11 tons, and El Dorado, 5 tons.

**THE SILVER CONNOR.**—Our reporter accompanied Wm. Stowell to the Silver Connor mine last Sunday to see the development in the tunnel that has been driven into the hill below the hoisting works. There is quite a lot of ore broken down and set out on the dump, probably 60 tons. The tunnel has cut through the ore body for a distance of 20 feet, and the raise to the old works is completed. The connection will greatly facilitate and cheapen the development of the mine. An examination of the old works from the surface down to the point of connection showed a large amount of ore in sight that can be easily extracted. The owners will probably commence shipping ore to the furnaces in a

few days, as it comes out so rapidly, with even the small force of three men that are at present employed, that there will be no room on the dump to store it. Several hundred tons have been stowed out from the old works just above the tunnel level, and there is now as much or more ore in sight.

#### Garfield District.

**THE IDA.**—Esmeralda News, April 21: The indebtedness of the Ida mine, Garfield district, has been settled, and Mr. Fish of Dayton, one of the principal owners in the mine, has been in this section during the past week, making all necessary arrangements for the resumption of operations. The mine has already produced \$15,000 in bullion and has a quantity of good ore in sight.

#### Hawthorne District.

**EARLY DAWN.**—Esmeralda News, April 21: C. B. Kimball and Charley Ganong, the owners of the Early Dawn mine, are highly elated over the discoveries made in their mine during the past week. Mr. Ganong brought a sample of the ore from the mine into town this week. It is as nice a specimen as has ever been brought in from the district. From men who visited the mine last Wednesday and who had examined the ore, it is claimed that it will go away up in the hundreds.

**GOOD PROSPECTS.**—Syl Light is working steadily on his mine. He has been at work on the claim but a short time and has now nine sacks of galena ore on the dump that he expects will work from \$75 to \$100 per ton.

#### Jefferson District.

**SILVER.**—Belmont Courier, April 21: Charles Kanrehat and the Nelson brothers have made their first shipment of silver bullion from Jefferson. Their mill is running steadily.

#### Patterson District.

**MOVING A MILL.**—Pioche Record, April 14: The 10-stamp quartz mill at Silver Park district, owned by Chandler & Comins, is being removed to Patterson district. Teams from White river are hauling it and expect to have it delivered during this month. It will be used to work ore from Ed L. Robertson & Co.'s mines. Salt Lake parties are furnishing capital for the enterprise.

#### Robinson District.

**THE KEYSTONE.**—Eureka Sentinel, April 21: H. Featherstone and J. B. Reynolds came over from Robinson district last Sunday, and the former on the following day left for Cortez to see Mr. Clark at that place in reference to the erection of a small leaching-mill, which they propose to erect at the Keystone mine. The mine is looking very well, having about 2000 tons of ore in sight that will average over \$40. The plant they are figuring on is one of from five to ten tons per day capacity, and they intend to build it as soon as their plans are completed.

#### Spanish Belt District.

**BARCELONA.**—Belmont Courier, April 21: The Barcelona mine never looked better than it does at present. All the stopes are showing fine ore, and the Monitor-Belmont mill ought to make a profitable run this summer. The concentrators, which arrived at Austin last week, are on their way to the belt. They will be put in working order as early as possible after their arrival and started up concentrating the low-grade ores of the Barcelona. The concentrations will be shipped for treatment.

#### Tuscarora District.

**BELLE ISLE.**—Times-Review, April 20: The stopes continue to yield their usual amount of ore.

**COMMONWEALTH.**—100-foot level: South drift has been extended from the station 23 feet; face is in clay, carrying seams and bunches of ore assaying \$79 to \$340. The south intermediate drift has been extended 15 feet, the ore being very high grade. North drift from bottom of winze the ore has improved and looking better than at last report. It has been extended 11 feet, which gives an opening on this ore body of 108 feet from face of south intermediate to the north end of opening, and still looks well for continuing.

**NEVADA QUEEN.**—Upraise being put up to connect with the winze from 200-foot level has been extended up to feet; total, 58 feet. The face is still in good ore, but does not show quite so well as when last reported. This raise is being carried up on the footwall side and only takes part of the ore, there being fine ore overhead all the way down to the 350-foot level.

**GRAND PRIZE.**—West crosscut, 200-foot level, extended 33 feet. Have passed through strata of rich ore during the week. Upraise above the 300-foot level slopes up 30 feet, and work stopped until the 200-foot level south drift can be extended to connect with the same for ventilation; the top of the raise being still in good ore.

**PUNDERE.**—East ledge end of crosscut has been advanced 7 feet; total, 28 feet. Ledge is not as hard as heretofore. There is one foot of ore which is improving as we go north. The face of this drift is all in quartz with bunches of sulphure ore.

**NAVAJO QUEEN.**—North drift from east crosscut, 200-foot level, advanced 15 feet; ledge is looking very well, showing seams of sulphure and quartz in the face.

**FOUND TREASURE.**—Upraise No. 2 has been extended 10 feet. Upraise No. 3 has been carried up 10 feet. The faces of both raises are in high-grade ore.

**NAVAJO.**—South drift from east crosscut No. 4, same level, extended 8 feet; the face looks favorable. The stopes continue as at last report.

**NORTH BELLE ISLE.**—The usual quantity of ore has been sent to the mill and dumps. Everything about mine and mill is running smoothly.

#### ARIZONA.

**CHERRY DISTRICT.**—Prescott Courier, April 17: The Mammoth, owned by Jas. Allen, is opened by three shafts, the deepest of which is 80 feet. Ledge is five feet thick. Averages between \$12 and \$15 a ton gold. Formation granite. The Joe Wheatley lode, belonging to James and John G. Allen, is four feet wide at the bottom of a 60-foot shaft. Average assay of the ore \$20, gold. Assorted ore has paid well in an arastra. Richard DeKuhn is opening what his neighbors say is a grand ledge. The McWhorter is a strong vein. It is opened by shaft. McDermid and Linn are developing mines for Prescott parties. Yank Smith is crushing ore from his ledge in an arastra. Mr. Boyer is making money

by grinding his ore in arastra. Tom Goodwin is in same business. So are Thompson & Denny. East of these mines is the Etta, one of the best gold mines in Arizona. West are the United Verde copper mines. The district is about 30 miles east of Prescott and near Verde river and valley; is well timbered and watered; has an excellent climate.

**WEAVER.**—Kerr mill being put up. Plenty of ore ready for it. Mr. Cockburn says he is shipping two carloads of ore each day from his sampling works. David Grubb, who owns two of the best mines—one gold and the other silver—in Hassayampa district, went to his camp yesterday. Four fine quartz wagons, built by Schutler for the Etta Co., have arrived from Chicago and will be taken to the mine. They are of the narrow track persuasion. Fine concentrators and other machinery have come from Chicago for A. L. Kerr & Co. of Weaver district. A dozen or more prospectors left town yesterday for the mountains in quest of veins of the precious metals.

**WALKER DISTRICT.**—Moore & Doggett, owners of the Amulet mine, are hoisting about five tons of silver ore a day. It samples from 350 to 450 ounces per ton. Carmichael Bros. are opening a very large gold vein. Their mill is running. Other mine-owners are at work. Placer miners of the district are saving from \$200 to \$500 a day, gold.

**HASSAYAMPA.**—Dan O'Boyle taking gold out of the Montgomery mine. Oro Fino Hydraulic Company just made another big cleanup. Silver Trail mine producing good ore. So are mines belonging to Smith & Bigelow, Brown & Dunlap, Harlan & Barrington and others. Preparations being made for working of the Senator.

**BRADSHAW.**—About 60 miners at work opening rich properties. Moody, Place & Co. getting ready to mill. Oro Bella Co. has fine veins.

**BIG BUG DISTRICT.**—Boggs is timbering and drifting. Van Name putting up quartz-mill. Roberson & Foster piling up rich ore.

**TIP TOP.**—Heavy shipments of rich silver ore. One 20-ton shipment from the Tip Top mine.

#### COLORADO.

**COMPROMISED.**—Elk Mountain Pilot, April 18: It is said that Messrs. Hawkes and Taylor have compromised their difficulties and that great things may be looked for on the Ruby Chief group this season. The amount of low-grade milling ore in sight is unlimited, and with the late improved methods of concentration introduced by Matt Nichols we are confident that large profits may be derived from working this property. Work has been commenced on the Little Gerie lode, in Elk basin, by Isaiah Harley.

**CO-OPERATION.**—For the past year a party of coal miners have been prospecting for coal about six miles south of town in the mountain ridge separating Slate river from the waters of Ohio creek. It is a co-operative company made up of eight miners here in town, who have the right to acquire 160 acres apiece, a part of whom work and the rest furnish the means to keep their fellow-workmen supplied. It was their object and belief that they would develop the C. C. & I. coking coal vein, which has been prospected for a number of years. From the broken and upheaved condition of the mountains it is not at all unlikely that just as good coking coal can be found there as is mined from the C. C. & I. mine. The boys had a good outcrop where they have made their opening, showing coal measures to exist on the surface, but as yet they have been unable to find the vein in place. They are still working it vigorously.

#### IDAHO.

**GOLD ON THE SOUTH FORK.**—Wardner News, April 17: An important mining deal was perfected on last Wednesday evening whereby Jim Wardner obtained a conditional interest in the gold locations on Elk creek known as the Minnie, Vernie, Nelly Wood and Allafretta. These mines, owned by Jack Curry, Charles Manly, O. A. Brown, J. Johnson, Andy Evans and Thomas Wall, are about 1½ miles from Wardner. Of late they have attracted considerable attention, and all well-informed mining men who have seen them unhesitatingly pronounce them the most promising gold locations yet discovered in Coeur d'Alene. Jim Wardner, who has had an extensive and varied experience in mining matters, has made a conditional contract with the owners, whereby development on a more extensive scale will be commenced on all of the locations immediately. He has agreed to do \$1400 worth of work, and on completion of same, if satisfied with the result, will erect a 20-stamp mill on the ground which he agrees to have in running order by the 15th of next July. The accomplishment of this work will give him a large interest in the property. The discovery and working of rich gold mines on the South Fork will add another great feature to the vast resources of this unequalled mining region.

**A BELT OF RICH VEINS.**—Wardner News, April 19: Commencing at a point near Big creek there seems to be a belt of veins bearing high-grade copper ore, which extends easterly back of Bill Osborn's ranch as far as the Argentine mine, making a distance of about three miles. On this belt are several very promising locations, consisting of the Polaris, Captain Horton's claim, Bill Osborn's and the Argentine. Several other locations have been made, but as yet the developments are not sufficient to show their value. W. B. Heyburn and Harry Dennis are carrying on the development of the Polaris mine with a force of several men, and now have a tunnel in on the ledge 400 feet and a shaft running from the tunnel 100 feet deep, all of which show high-grade gray copper ore averaging from \$700 to \$1000 per ton. The bottom of the shaft is now in a ledge about five feet wide, showing nearly a foot of gray copper. They are now proposing to construct a wagon-road from the mine to the mouth of Big creek and will then begin shipping ore.

**DEER CREEK PLACERS.**—Coeur d'Alene Record, April 14: John Cumerli's placer mining in the St. Regis country has been carried on so quietly that very few are aware what proportions the business is assuming. Mr. Cumerli's expense account for his Deer creek work is already upward of \$12,000, and the work laid out for this season will swell the figures up nearly, if not quite, to \$30,000, and possibly more. There are 15 claims embraced in the field covered by his operations. All the work done

up to this time, and all that will be done for some time to come, is preparatory to getting extensive hydraulic works in operation, and no returns are expected at present from this large investment of capital. Surveys will soon be made, and patents applied for. A sawmill is being erected, and everything is being done after the usual practical and judicious methods which characterize all of Mr. Cumerli's operations.

**THE HENRIETTA MINE.** Wagon town, is improving in richness as work progresses. We were shown, a day or so since, by H. S. Howe, superintendent, several specimens of ore taken from the lower level and the winze now being sunk, that were unusually rich. In fact, they seemed to be half silver. The lode is about three feet wide, and is growing richer as depth is attained. There is now no doubt that Mineral Hill, as the hill is called where the Henrietta mine is located, contains a large deposit of very rich ore, which Supt. Howe says he will find for the Prouette Co. The Henrietta never looked better.

#### MONTANA.

**CASTLE DISTRICT.**—Castle News, April 21: A new shaft was commenced on the American Tuesday. Ore is being taken out from the start and of better quality even than that found in the tunnel. A fine body of ore has been struck on the Cape Horn in the Smith district. A lead of four feet was opened up Saturday, making a magnificent showing. L. Hensley brought in a piece of float yesterday from a location situated between the Chollar and American. It is a fine piece of gray carbonate assaying 291 ounces. Smith Bros. have shown their unbounded faith in their mines from the first. They have expended about \$2500 in improvements and are realizing their expectations. These gentlemen have extensive placer mines in Thompson gulch also. We visited the Powderly Saturday. A tunnel is run 120 feet where it opened into a cave of the lead showing 3½ feet breast 73 feet below surface. The owners are greatly elated over their strike, as they have cause to be. The Black Hawk has a shaft now 90 feet and not yet through the iron ore which extends the whole distance from the surface to the bottom of the shaft. Neither wall is yet found of this immense body and which is pronounced by experts the best fluxing they ever saw. The Cumberland Co. have the new shaft down 150 feet and are crosscutting from the new to the old shaft to get air for working the new one. A crosscut is also being made at the 18-foot level and through an excellent ore body. A force of men and teams is making a road from the mine to the county road preparatory to freighting away the ore.

#### NEW MEXICO.

**ORGAN MINES.**—Rio Grande Republican, April 14: Concentrating works are still demanded at Organ. John B. Thompson is working the Crescent City. Clark and Brown are driving a tunnel on the Black Prince. G. W. Heavis is at work on the Antimonial with Hufford Bros. A. A. McLaughlin is at work on the Tougnot, and it is producing some very good ore. Lew Cowan and Buck Akes have a handsome prospect on the Silver Star, adjoining the Little Buck. It is high-grade ore. Sam Hughes and Hoskins are delving into the bowels of the earth on the Little Buck, and some first-class ore is rewarding their labor. The shipment of 10 tons of ore from the Grey Eagle netted \$1010, the first-class ore running 227 ounces in silver and 70 per cent lead, and the second class 60 ounces silver. The ore was milled at Pueblo. The Jay Gould is owned by Elijah Davis, Jim Robinson and Billy Hayden. They have started to do some work on the property. It at one time yielded the copper-silver ore on which the smelter ran. Returns were received from a mill-run made from ore shipped from the Ben Nevits this week, which show that it is one of the best mines Organ has produced. The returns from two classes of ore gave, first-class, 74 ounces silver; second class, 46 ounces silver and 8-10 of an ounce gold. The vein has been crosscut 12 feet and no wall has been reached. Any other camp in the Territory, with the same prospects that are found in Organ, would have been developed to a great depth, but little deep mining has been done. It is a significant fact that the Memphis and the Bennett, where the only depth has been attained, found excellent ore. Organ needs capital, and it would be well invested.

**MILL.**—Silver City Enterprise, April 21: Captain Davis' 5-stamp mill at Pinos Altos is running regularly on ore from the Aztec mine. H. H. Betts and Fred Sheldon have sent timber to the Peleg at Cow springs and will begin work. Seven carloads of ore were shipped from Silver City Wednesday, including one of Mountain Key concentrates. D. B. O'Brien has leased one of W. H. Newcomb's claims just southwest of town and is shipping iron ore to the Billings smelter. The sinking of the shaft on the Golden Giant is progressing as rapidly as possible. The mine is making a splendid showing. Captain Cooney's new mill on Silver creek, in the Mogollons, is working perfectly, and the captain will soon have a nice lot of bullion to ship. The Alhambra, at Black Hawk, has seven or eight tons of ore on the dump worth \$700 per ton. The owners will probably make another shipment soon. Last month \$30,000 in silver bullion and \$14,000 in dust and gold bullion were shipped from this city. This does not include the concentrates or ore shipped.

**HERMOSA.**—Black Range, April 13: The one, I not the brightest mining camp in the Territory, is Hermosa, situated in Sierra county between the towns of Hillsborough and Chloride. This camp is one of the few self-sustaining camps in our mining world. For years have the mines of Hermosa been worked and developed by their owners, whose only capital was muscle and courage, and who for their enterprise and courage have been liberally rewarded. To-day many of the pioneer miners and prospectors have surrendered their rights to capitalists who are fast taking possession of the mines of the camp, and in turn are very jubilant over the prospects before them, and lively times are anticipated here this summer.

**TOTAL PRODUCT FOR 1887.**—The total product of bullion and mineral for the past year of the county of Socorro from all sources amounts to \$2,816,079.13, an increase over 1886 of \$183,945.72. The product during the current year will now, we are certain, reach over \$3,000,000. This is a striking result when

we reflect that in 1880 the county of Socorro did not realize one dollar from its mines or mechanical industries. We would be unjust, however, were we not to add that the ore from which it was secured was drawn from the other camps of New Mexico and Arizona, as well as from those situated in Socorro county.

**HERMOSA.**—Cor. Socorro Bulletin, April 7: The Hermosa concentrator is working continually and successfully on second-class ores produced from the various mines heretofore. The producing mines in camp now working are as follows: The Antelope, Ocean Wave, Longfellow, Homestake, Pelican, Vulture, Albatross, Eagle, Palomas Chief, Embolus, Happy Anna, Atlantic Cable, Argonaut, Ell. Humming Bird, which is a fine producer of high-grade mineral is at present idle pending a sale. The American Flag is also a fine piece of property and has produced considerable high-grade ore, but is idle at present. It is owned by Eastern parties, and were it owned by parties in camp, it would be as vigorously worked as the other good mines of the camp, that are owned by men without capital only what they take out of the ground.

#### OREGON.

**THE CRACKER CREEK MINES.**—Bedrock Democrat, April 10: The Democrat office received a call yesterday morning from Mr. J. W. Gray, one of the owners of the Silver King mining property on Cracker creek, about 35 miles northwest of Baker City, which mining section has already been made famous from the extraordinary rich showing made by the Eureka, owned by Messrs. Knowles & Bourne, Portland capitalists. Mr. Gray informs us that a force of seven men has been at work on the property all winter and the result of operations is a tunnel 140 feet in length and another upward of 80 feet in length, opening up a vein of ore six feet in width, a sample of the ore now lying on our table yielding an assay of \$165 to the ton. The owners of the Silver King are greatly encouraged by the result of their winter's work and are confident that they have a bonanza. Cabell Bros. have worked all winter on their extension of the Eureka, and an assay from a strike made in their ore body about 10 days since yielded returns of the enormous sum of \$13,880. In fact, the ore found was simply a body of rich specimens. The vein is large and all indications point to one of the richest discoveries ever made in Baker county. West of the Cabell Bros. property, Messrs. Ridgeway & Taft and four other companies are doing extensive development work with the most encouraging prospects. The Cracker creek district is proving itself to be wonderfully rich in mineral deposits, and before the summer is over a large amount of capital will be introduced there and mills for the reduction of the ore is almost an assured fact.

**BAKER CITY.**—Bedrock Democrat, April 16: The outlook for Baker City to-day as a mining market in which there will figure heavy sales of properties this season, is more favorable than at any time during her past history. The fact has gone abroad that within a radius of 100 miles she counts her paying mines by the thousands, and the same has been certified to in such a way that the capitalist who wishes to invest his money in mines is fully assured that to purchase property in this section is not to risk his capital on a mere experimental basis. To enumerate the titles of our now fairly known mining districts would require more space than can be accorded in an article like this; to mention by name one-fourth, even, of the paying properties being actively operated in these districts is impossible, but scarcely a day passes in which the Democrat is not called upon to record a rich strike here and a new discovery there, thus heralding to the outside public the story of an Ophir that will some day make the name of Oregon familiar with the stock markets of the world.

**FROM GRANITE.**—Bedrock Democrat, April 16: Our reporter was yesterday shown a letter from Ike Klopp, who is largely interested in mining properties on Onion creek, this county, and judging from its tone, the boys in that section are jubilant. Of his property on Onion creek, eight miles from Granite creek, Mr. Klopp says the ore in the middle tunnel has a width of 18 inches and they have not yet reached the hanging-wall. This letter also mentions a new strike being recently made in the Cabell mine, which is pronounced rich, and further states that Garrison & Co. are taking out very fine ore from the tunnel in their mine. Mr. Klopp expects to shortly commence operating his gravel mines on Onion creek. Water is abundant and a good season is anticipated. The letter speaks in glowing terms of the general features of the entire camp, and represents the miners as being in a more hopeful mood than ever before.

#### UTAH.

**REVIEW.**—Salt Lake Tribune, April 20: The receipts in this city for the week ending April 18th, inclusive, were \$139,339.82 in value in the aggregate, of which \$75,438.85 was ore and \$63,900.97 was bullion. For the previous week the receipts were \$57,666.29 in ore and \$17,849 in bullion; a total of \$75,515.29. The Ontario's output for the week was 26 bars of bullion, 16,737 fine ounces, and \$25,890.13 in ore sales—an approximate total of \$42,627.13. The Daly product for the week was seven bars of bullion, 10,289.28 fine ounces. It is understood to be making shipments of ore from time to time. Fine bar receipts in this city for the week were to the value of \$35,274. The Hanauer smelter produced during the week, bullion valued at \$14,530; the Germania, \$14,096.97. Ore receipts here for the week were to the value of \$44,131.12 by Wells, Fargo & Co.; \$16,000 by McCormick & Co., and \$15,307.73 by T. R. Jones & Co.

**ORE AND BULLION SHIPMENTS.**—Park Record, April 21: The Crescent has made no shipment of ore the past week on account of the sampler being shut down for repairs on the boilers. The following lots of ore were shipped from the Mackintosh sampler since the first of the month: Ontario, 1,120,000 pounds; Daly, 338,180 pounds; Sampson, first-class, 40,880; second-class, 252,200 pounds. On Wednesday the Ontario shipped 26 bars of bullion, containing 15,063 fine ounces of silver. Last Sunday the Marsac mill shipped 7 bars of bullion, containing 8231 fine ounces of silver, and yesterday 7 bars more were shipped, containing 7995 fine silver ounces.

THE  
DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to supersede the old stamp in mills of the largest capacity.

TATUM & BOWEN,

34 and 36 FREMONT STREET, SAN FRANCISCO, CAL.  
Manufacturers of Mining and Sawmill Machinery, Engines, Boilers, Etc.

L. C. MARSHUTZ

T. G. CANTRELL.

NATIONAL IRON WORKS

N. W. Corner Main and Howard Sts., San Francisco,

—MANUFACTURERS OF—

Stationary and Compound Engines, Flour, Sugar, Saw and Quartz Mill Machinery.

AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description

ALL WORK TESTED AND GUARANTEED.

IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

Send for Circulars and Price List.

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Ovals Cases, free of cost, by applying to the manufacturers.

## PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

### POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of this Pulverizer, its extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SASH HOLDER.—Frank B. Moore, S. F. No. 381,268. Dated April 17, 1888. This invention relates to devices which may be used to fasten windows and prevent their being opened when in one position, and when reversed will act as a catch to hold the sash at any point where it is desired to have it remain when raised.

THRILL COUPLING.—Aug. F. Moltzen, Oakland, No. 381,267. Dated April 17, 1888. This thrill-coupling consists in the adjustable yoke or hearing-plate to be secured to the axle, the pivoted latch on the shaft-iron for connecting said shaft with the hearing-plate, the spring for holding the latch to its seat and preventing rattling, and the thumb-lever for lifting the latch from its seat in order to release the shaft-iron.

DREDGER DIPPER.—M. C. Lawton, Staten Island, San Joaquin Co. No. 381,258. Dated April 17, 1888. This invention relates to that class of dredger-dippers or buckets commonly known as the "clam shell," and which employ two oppositely pivoted jaws with mechanism for forcing them together and releasing them. The invention consists, in connection with the jaws of crossing links, sliding cross-heads and a sliding or varying connection between the links and cross-heads. The object is to increase the power in closing the jaws.

DREDGER DIPPER.—Manley C. Lawton, Staten Island, San Joaquin Co. No. 381,257. Dated April 17, 1888. This dipper is of the clam-shell type. The invention consists, in connection with the jaws of the dipper, of the crossing links by which they are operated, and the sliding cross-heads to which the upper ends of the links are pivoted. The object is to provide a construction by which a much greater leverage may be obtained to increase the power of the jaws in closing, so that said dippers may be used in harder material than they have heretofore been found adapted for.

WIRE ROPE-MAKING MACHINE.—A. S. Hallidie, S. F. No. 381,365. Dated April 17, 1888. This improvement in wire-rope making machines consists of a horizontal rotating frame within which the wires are carried and laid up, and means for supporting and driving said frame, mechanism or swifts for supporting the wire in bundles in place of bobbins, tension and brake mechanism, and certain details of construction. The bundles of wire of which the rope is to be formed are laid upon the swifts in each of the 19 sections of the revolving frame, and as the frames supporting these swifts are journaled at each end in line with the axis of the revolving frame, and are provided with a heavy counter-weight, it is manifest that while the outer frame revolves, these swift-supporting frames will remain stationary with the bundles of wire uppermost. From these bundles the wire passes around the pulley of the tension device, the elasticity of which allows for any irregularity in the taking off of the wire. From this tension apparatus the wire passes through a hole

in the end of the swift-supporting frames, and is led thence outward to the pulleys on the sides of the revolving frame. A single wire or core is covered by six wires which are laid around it. These six wires forming the strand or core are again covered by 12 wires which are laid on from the outside in the well-known manner.

FEEDER FOR CAN-BODY-MAKING MACHINES.—Joseph Stevens, S. F. No. 380,774. Dated April 10, 1888. The device is for feeding sheets of tin into the machine where said sheets are bent into cylindrical shape to form can bodies. It has been customary hitherto to feed the sheets of tin by hand into the machine, by which said sheets are formed into a cylindrical shape for can bodies. This invention is designed to provide an automatic feeder for this purpose. This feeder is intended to stand in front of the body-forming machine, and its mechanism is operated by cams or cranks on the body-forming machine.

CASH REGISTER AND INDICATOR.—Edward T. Taylor, Oakland, No. 380,831. Dated April 10, 1888. This cash register and indicator consists in the employment of tubes containing disks, which represent the coins or amounts to be handled in combination with reciprocating slides, by which the disks are allowed to fall from an upper compartment to a lower one, and thus register the amount placed in the till, and in connection with these of indicators, and a mechanism by which said indicators are operated, the cover of the till or drawer opened and a bell sounded.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

BRADFORD QUICKSILVER M. Co., March 23. Location, Lake county, Cal. Capital stock, \$80,000, in 16 shares. Directors—C. P. Bradford, Edward Bradford, G. Frederick Bradford, John Treadwell and James Treadwell.

FORT JONES GRAVEL AND QUARTZ M. Co., March 24. Capital, \$5,000,000, in 100,000 shares. Directors—Joseph Austin, G. E. Benison, F. D. Fraser, D. Sanderson, and J. M. Haskell.

SAN RAMON VALLEY R. R. Co., March 24. Capital stock, \$1,050,000. Directors—J. P. Brown, D. D. Stuhls, W. L. Brown, A. J. Treat, and G. L. Lunsing. The road will run from Avon, on the San Pablo and Tulare railroad, to a point on the Central Pacific near Pleasanton, in Alameda county. Avon is a point a few miles east of Martinez, at the entrance of the fertile valley in which the town of Pacheco is situated. The line, which is 35 miles in length, traverses the Central valley of Contra Costa county from north to south. This valley varies from half a mile to six miles in width. The line runs west of Mount Diablo, and as surveyed touches the towns of Walnut Creek, San Ramon and Danville.

RAMONA AND SAN BERNARDINO VALLEY R. R., April 24. Capital stock, \$2,030,000. Directors—G. L. Lansing, J. P. Brown, Fred Madge, C. G. Lathrop, and C. B. Hayes. The road will run from Ramona on the Southern Pacific, in Los Angeles county, to Creston, one of the new towns in San Diego county. The estimated length is 71 miles.

PIEDMONT G. M. Co., March 25. Location, Tuscarora district, Nev. Capital stock, \$10,000,000, in 100,000 shares. Directors—A. E. Davis, Herman Zaidig, J. B. Dayton, L. Fannoff and W. R. Townsend.

Mining Share Market.

Miniog stocks continue rather quiet, notwithstanding favorable developments upon the Comstock. The Virginia Enterprise pertinently remarks: "After a mine has developed its wealth and shown beyond cavil that it contains a certain number of dollars, it loses its speculative value. That is plain enough. But that which puzzles the understanding is, to know why a mine should lose value because of the fact that it has demonstrated itself valuable. There are several such cases on the lode today. The gamble in them was pretty good until it was definitely known that they were fully as rich as the people were hetting their oash that they were, and then, after a realization of their dream, the stocks fell flat. This anomalous feature in stock gambling is simply inexplicable, and contains no further serviceable trait than to demonstrate the fact that the men who work in the mines and know what is coming in and pinching out have no advantage over the unsophisticated mud-hens, who sleep on a wedding-cake for luck."

NO REGULAR PAY-DAY.—The Tombstone (A. T.) Epitaph notes that Prof. Douglas, general manager of the Copper Queen Mining Co., recently made a speech to the miners of Bisbee, in which he stated that the wages would be \$3 50 per day; that no work would be done in the mine on Sunday, and that there would be no regular pay-day. The men could draw their money when they wanted it, or could let it remain with the company, as they pleased. This last was done to discourage gambling.

It is expected that the mines of East Belmont, Nev., will be worked on an extensive scale this season.

MINING SHAREHOLDERS' DIRECTORY.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

## Boiler Inspection.

The Pacific Coast Association of Stationary Engineers has addressed a letter to the various Republican and Democratic clubs in this city. It has especial reference to the steamer Julia disaster, and was the result of a discussion held at the last meeting of the engineers. The letter will be sent to the State Conventions, and is as follows:

PACIFIC COAST ASSOCIATION OF STATIONARY ENGINEERS, 1325 MARKET STREET, SAN FRANCISCO, April 20, 1888.

Gentlemen: The above-named association respectfully requests that you instruct your delegates to the State Convention to endeavor to procure the insertion of a plank in the platform of the party demanding the annual inspection of steam boilers, and the examination of the men in charge of them as to their competency.

From the destruction of life, property, etc., resulting from recent explosions you must all be aware of the danger attending the use of steam boilers, even under the most favorable conditions.

At present there is no State law governing the use of steam boilers or the men in charge of them, consequently laborers or mechanics working in planing-mills, factories, etc., are liable any moment to be hurled into eternity, through the avarice of some boiler-owners or the ignorance of the cheap man or boy in charge.

We have formerly appealed to the Legislature to pass the desired laws, but the vigorous opposition of a few wealthy steam users has succeeded in preventing the passage of said laws. We now appeal direct to the people, whom we know are heartily in favor of such laws.

By instructing your delegates, as above requested, you will be protecting yourselves as much as any or all of the members of this association.

Trusting that our request will be approved and acted on by your body, we are, yours respectfully,

W. J. MOORE, President.

ALEXANDER MCCONNELL, Secretary.

## Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

J. A. JOHNSON, 307 Montgomery street (the Nevada Bank building) is the general agent of the Stiles quartz machinery, and offers easy terms for introduction.

## ASSESSMENT NOTICE.

**Butte Creek Hydraulic Mining Company.**  
Location of principal place of business, San Francisco, California. Location of Works, Butte county, Cal.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 27th day of March, 1888, an assessment (No. 12) of five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary at the office of the company, No. 213 Market street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 7th day of May, 1888, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Monday, the 27th day of May, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

LOUIS R. LEVY, Secretary.

Office—No. 213 Market street, San Francisco, Cal.

## Mining Machinery For Sale.

Having completed our tunnel, we offer for sale:  
1. No. 4 Birlb Air Compressor, with shaft arranged to be run by steam or water power.  
1. No. 4 Duplex Clayton Air Compressor.  
1 Air Tank 48 in. by 16 ft.  
1 Llewellyn Water Heater, 24 in. by 8 ft.  
1 No. 3 Knowles Pump.  
1 Small Hooker Pump.  
7 Burleigh Tunnel Drills.  
1 Lot of Drill Extras.  
1 "E" Battery for blasting.  
1 Triple-Geared Hoisting Engine, built by Copeland & Bacon.

The machinery is all in good order and can be seen at our works. For prices and other information, address

BIG BEND TUNNEL & M'G CO.,

Big Bend, Butte Co., Cal.

The BUYERS' GUIDE is issued March and Sept., each year. It is an encyclopaedia of useful information for all who purchase the luxuries or the necessities of life. We

can clothe you and furnish you with all the necessary and unnecessary appliances to ride, walk, dance, sleep, eat, fish, hunt, work, go to church, or stay at home, and in various sizes, styles and quantities. Just figure out what is required to do all these things COMFORTABLY, and you can make a fair estimate of the value of the BUYERS' GUIDE, which will be sent upon receipt of 10 cents by post, to MONTGOMERY WARD & CO., 111-114 Michigan Avenue, Chicago, Ill.

## CLAYTON AIR COMPRESSORS,

For Working

Rock Drills, Coal Cutters, Hoisting Engines and Water Pumps in Mines and Tunnels, Sinking Caissons, Elevating Acids, Transmitting Natural Gas, Atomizing Petroleum, &c For Catalogues, Etc., address, Clayton Air Compressor Works, 43 DEY ST., NEW YORK.

## ELECTRIC DEVELOPMENT COMPANY.

## Incandescent &amp; Arc Electric Lights.

Electric Motors, Dynamos, Trams, Elevators, Signals and all kinds of Electrical Systems for lighting and transmission of power, either direct or with storage Batteries.

For Mines, Hoisting Works, Mills, Reduction Works,

Indoor and Outdoor Illumination of every kind. Gas, Oil and Candles superseded by the

EDISON INCANDESCENT LIGHT,

The only complete and satisfactory incandescent system. Lights require no attention, and are under complete control. Over 500,000 lights in use in the United States. SELF-REGULATING ARC LIGHTS turn night into day and afford a means of working the whole 24 hours; invaluable to contractors and others to whom time is an object. Estimates and designs on application.

Offices and Showrooms, 323 PINE ST., SAN FRANCISCO.

## CALIFORNIA VIGORIT POWDER CO.,

No. 40 California Street, San Francisco,

—MANUFACTURERS OF—

## NITRO-GLYCERINE

("DYNAMITE" or "GIANT")

## Blasting Powders.

Vigorit "LOW" Powder,

FOR REMOVING STUMPS AND TREES, HAS NO EQUAL.

WORKS: California City, Marin Co., Cal.

ED. G. LUKENS, Manager.

## THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

## GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

## JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroad and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

## BANDMANN, NIELSEN &amp; CO.,

CAPS and FUSE for Sale.

GENERAL AGENTS, SAN FRANCISCO CAL.

## THE RAND DRILL COMPANY,

23 PARK PLACE, NEW YORK,

Are now so situated with their new works as to offer to the miners of the Pacific Coast small Air Compressing Plants at such prices that almost any small mine can afford to put in power drills if they have none in use.

By their new and patented systems (by which the duty or performance of drills is not reduced with use) it is no longer necessary to buy a Compressor of double capacity than the drills are expected to require, in order to keep up the supply of air necessary on account of the wear of drills and compressor.

Besides having the newest and lightest designed small drill plants, the Rand Drill Company, as is well known, has built, and is now building, the largest Compressor plants in this country, and has patterns for all sizes up to 40-inch diameter of cylinder.

In respect to capacity in speed of drilling, perhaps it is in order to say that in every authoritative contest for speed yet initiated, the Rand Drills have, without exception, been victorious. This fact, coupled with another important one, that the drills use much less air and cause less repairs, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained them from the California market no longer exist, they are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor now being built for the Anaconda mine in Montana.

## FOR SALE.

2 Triumph Concentrators.  
1 New 12-inch, 35 H. P. Engine.  
VERY CHEAP. Apply  
130 Sansome St. room 12.

NEWTON COPPER MINE, Amador Co.  
Correspondent as Agent for Smelters in London, Liverpool, New York, Boston and Baltimore.

Twenty years experience, in California, purchasing Ores and dealing in Mines.  
Special attention given to management and sale of mines and purchase and shipment of copper produce.

Dewey & Co.'s Scientific Press  
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

**\$1,000 CHALLENGE ACCEPTED,**  
**PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).**

**THE "TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

## California Marine Engines.

Within the past three years the coasting trade has largely increased in California, especially that connected with the lumbering interest. Formerly all the lumber was transported on sailing schooners, but of late steam schooners have been employed. These vessels have masts and sails, and use the sails when the wind is fair, but they steam up the coast against the summer winds, which blow from the northwest. So while the schooners from the lumber ports have a fair wind down when loaded, they steam up when light, and a great deal of time is saved.

The Fulton Iron Works of this city have built most of the engines for those steam schooners, having made a specialty of this class of work. We give on this page an engraving of the type of compound engines made by them. They are made from 50 to 500-horse power in sizes, but of the same type. As a rule they are the ordinary engines, built compactly and light, and do not differ in arrangement from compound engine as built all over the world. The simplest and most efficient details have been adopted. The engraving shows the style plainly. For the lumber schooners engines are made from 150 to 300-horse power; the larger ones for colliers, etc.

There are some eight or ten of these engines being made at the Fulton Works now, and this week we saw several of them set up and receiving the finishing touches. There are four of the ordinary compound on hand, all of 150-horse power, and three are those of 200-horse power. Several triple-compound engines have been and are being made—those for the Noyo, San Diego, Point Loma, and one other, are complete. The trial trip of the Point Loma was made this week, and was very satisfactory. One quadruple engine is now being fitted up for a coaster. A large triple-engine is being built for a steam collier. This engine will have a high-pressure cylinder of 18 inches, intermediate of 30 inches, and low-pressure cylinder of 48½ inches, with 36-inch stroke. This is about a 600-horse power engine. The steel plates for the boilers of the triple-engines are an inch thick, and those for the quadruple are 1½ inch thick. The triple-engines are made for 150 pounds pressure, and the quadruples to run with 175 pounds. All the engines are compactly made and are strong and durable.

THE Lyon county Times says: "The boat for the Carson River Dredging Co. is now floating on the bottom of the Carson, and draws less than four inches of water. The machinery has been arriving steadily and it is almost certain that it will be all here, and placed before the 1st of June. The large pieces are all here excepting the crane and two 50-horse power engines. The engines are on the road and expected to arrive this week. As soon as the crane arrives, men will be put on, the machinery put in place, and its efficiency fully tested.

THE Clayton Mining & Smelting Co. of Clayton, Idaho, have ordered an Ingersoll air compressing plant and Ingersoll drills for use in their mines, which machinery is now en route for Clayton.

OVER at Silver Reef, Utah, they are talking about a mysterious process of working their sandstone ores by concentrating the sun's rays in some manner not explained.

## Tin.

The French syndicate which has cornered the copper market has also been trying its hand on tin, and succeeded in forcing prices up considerably. But this week a sudden drop has come, and the decline in the foreign market is said to be equivalent to about \$50 a ton. This has seriously crippled not only foreign speculators but those at home. On May 1st they had to suspend calls on tin in the New York Metal Exchange until the market is more settled.

To use a slang phrase, the Frenchmen have "hit off more than they could chew," and evidently they will drop the tin corner and pay attention to the one they are managing on

## Coal at Livermore.

Steps are being taken to systematically open the mines belonging to the Livermore Coal Co., eight miles southeast of Livermore, Alameda county. Three distinct veins have been prospected, known as the Richards, Summit and Eureka, which are four, six and eight feet wide, respectively. The Richards vein is developed to a depth of 120 feet, where the coal is found to be about four feet wide and free from foreign matter. The Richards vein is connected with the Eureka by a tunnel at a depth of 60 feet, showing the Eureka to be 8 to 11 feet wide at that point, though no prospecting has been done on it. The Summit lies parallel with the Richards and is about 1000 feet distant. From

COMPOUND ENGINE FOR MARINE USE.

copper. Their losses are said to be up in the millions. This, to a certain extent, bears out our remarks in the PRESS of last week suggesting that people be careful in their dealings with the copper market, in view of the fact that the French syndicate might not be able to maintain prices at present rates as long as expected. They have been unable to do so with tin, as the events of this week show. They stopped buying tin, and as soon as they did a heavy fall in prices ensued. What will be the result if they stop buying copper, outside of their present contracts, remains to be seen. The copper interests of this country are benefited by the present high prices of course, but there is no telling how long they will be maintained, and if heavy enterprises are started on the present basis of price no one can tell what will result. It is stated that a Cornish expert has been examining the Tenescal tin deposits, San Bernardino county, in this State, and will make a report to English capitalists.

Development is going on in the tin mines of the Black Hills, Dakota, and it is expected that before long more or less metal will be put on the market.

this about 3000 tons of coal have been mined and sold at Livermore, San Jose, Stockton, Oakland and Santa Clara. It costs about \$1 50 per ton to mine, and cost of transportation is about \$2 per ton. It is expected that the Southern Pacific will build a branch road from Livermore as soon as the mines are developed and mining commenced in earnest.

It is stated that some \$20,000 have been expended on tunnels, shafts, stopes, etc. Robt. Stevenson, M. E., states that this coal is more of a bituminous character than a lignite. He is of the opinion that with prevailing prices of coal the mines can be worked profitably with a small capital, as the coal taken out will almost pay for necessary development. The following is the result of the analysis made by Prof. Price: Samples from Summit vein—water, 18.08; volatile carbonaceous matter, 39.30; fixed carbon, 35.61; ash, 7.01.

Samples from Richards vein—water, 20.78; volatile carbonaceous matter, 31.00; fixed carbon, 42.46; ash, 5.70.

Big steel works are to be built in Kittitas Co., Washington Territory, by an English Co.

## Some New Facts in Pocket Mining.

The auriferous deposits of California are more varied in their form of occurrence probably than in any other country, conditions that have led to the employment of equally diversified methods and appliances in searching after, exploiting and working them. It would naturally occur to most minds that after an experience of so many years the California gold miner would by this time have found out all there is to be learned in regard to the occurrence of this class of deposits as well as the rules to be observed in hunting after and developing them. While it must be admitted that our miners have become very expert both in this and every other branch of their calling, it is still the case that something new is all the while being brought to light in this department of the business.

As an instance in point the Sonora Democrat, Tuolumne county, describes certain new features that have been developed in the Bonanza Pocket mine being worked near that town. Formerly it was thought that this class of deposits did not carry free gold below the line of permanent water, where it was supposed the metal invariably took on the sulphureted form. The theory was also held that when the dike changed from a plastic to a hard and gritty rock, requiring blasting, it lost its gold-bearing character entirely. But recent developments in the above mine tend to invalidate if not wholly disprove both these theories. The auriferous lode or dike here has been opened up to a depth of 35 feet below the bed of Wood's creek, a permanent stream, and consequently below the level of permanent water; and yet the gold continues as free as it was above. Then, too, the lode formation has changed color and become so hard that it has to be broken out with powder, yet its productiveness has not been diminished in the least. The position of the rich pockets in this mine are marked by other peculiarities at variance with the notions formerly entertained in regard to the occurrence of this class of deposits.

In view of the above facts, it may be that our pocket miners have sometimes and perhaps very often suspended operations too soon, having been misled by hastily formed theories in regard to the changed condition of the gold-containing rock and the metal becoming sulphureted below the line of permanent water. As the business of prospecting for and extracting these "pockets," which consist of isolated bunches of rich ore, is still practiced in many parts of California, being quite active in Tuolumne county, the foregoing facts may be worthy the attention of those engaged in this branch of mining.

LEAD AND LEAD ORES.—Senator Stewart of Nevada is engaged in an important controversy with the Treasury Department concerning lead and lead ore. Both articles are taxed 1½ cents per pound by law. Several years since ex-Secretary Sherman ruled that such stuff coming in from foreign countries—mainly Mexico and Canada—when mixed with gold and silver, should come in free under the law admitting such metals free of tariff. This ruling has brought all the lead and lead ore in mixed with any precious metals, and no duty has been paid. Stewart objects to such policy, and demands that all gold and silver ore mixed with 10 per cent of lead shall be made dutiable.

### The Comstock.

The *Territorial Enterprise* has a long article showing what has been done on the Comstock since 1881. On the 15th of January of that year there were 16 stamps started at the Mexican mill on Crown Point ore. Previous to that date, after the bonanzas quitted their yield of pay ore, there was not a stamp dropping on Comstock ore for a long time. There was not a pick at work in Gold Hill. Development was going on by sinking and drifting to find new ore bodies below, and assessments were so numerous and heavy that most of the stock in the mines went into the coffers for delinquency. Real estate went out of sight. Property could not be sold or given away. The grass was growing in the streets and coyotes were killed within a few yards of C street.

Then it was that a few men met in the Crown Point office in Gold Hill and had a sort of council of war, though they had often interchanged views on the situation at every casual meeting. There was an immense amount of property going to rack and ruin in the shape of mills on the river that would never bring a dollar, except for old iron, and that would not pay the freight. The question was to do something; make some effort to preserve the workings of the mines—make a sort of last stand. Consultations were had with Mr. Mackay, Mr. Feir, Mr. Requa and other gentlemen, and they met nothing but discouragement, being told: "Gentlemen, we have mined there." "I have swept such and such walls with a broom," said one; "I superintended the work in this or that mine," said another, who stands so high as a miner that no one would ever believe he had left a dollar behind; and he considered it pre-emption on the part of any one who did. They advised John P. Jones, Sam Jones, Evan Williams and others, who wanted to make one grand effort, to save themselves. The advice was well meant, for failure meant lasting poverty; they were all then poor and in no condition for so hazardous an undertaking. Against all advice and every remonstrance, against the experience of the best miners and mining men the Comstock or the world ever saw, John P. Jones and his brother and Evan Williams started in to see what could be done. Sam Jones put 15 men at work in the Crown Point, and Evan Williams repaired 16 stamps and four pans of the Mexican mill.

The first month there were 500 tons of ore milled, which yielded \$7900, from which the discount had to be taken off. For several months afterward the yield was much poorer, and time and again men were laid off in order to bring the receipts up to the expenditures—but the mine was being explored all the time. As ore commenced coming in, the mill was enlarged a few stamps at a time, until the 44 stamps were running. In April of the same year, the Vivian mill was started on Belcher ore. Then the Brunswick mill, which was then controlled by the Bonanza firm, was started on Yellow Jacket ore. Everything worked was low-grade ore. Shortly after that the Bonanza firm started the Morgan mill on latches of ore from the Ophir, and then the Eureka mill started on Hale and Norcross ore in June, 1884. Then Senator Jones got a contract to work in the Con. Cal. and Virginia between certain levels. The Eureka mill was started on Con. Cal. and Virginia ore in November, 1884, and the Morgan mill was started on the same ore in July, 1885, and both have been running ever since.

Assessments began to come in again, and the Best and Belcher, Gould and Curry, Savage, Hale and Norcross, Chollar, Potosi, Ballion, Alpha, Eschequer, Confidence, Challenge, and many other mines, commenced to follow in the footsteps of the pioneers of the grand revival, and pierced the boundaries set by the former miners, and all have uncovered ore bodies, until the pay-rolls for wages on the Comstock have been raised from about \$50,000 per month to \$250,000—every dollar of which can now be paid from dividends.

This is an evidence of the changes that frequently come about in mining camps. Virginia City is to-day the liveliest mining town on the coast, while a few years ago it was virtually abandoned. Such a change will be seen in this district one of these days.

**EL DORADO COUNTY MINES.**—It is a well-known fact that we have in El Dorado county as good mines as are to be found in any part of California. But for various reasons too many of them that have been partially opened in past years are non-productive at the present time. In the first place, we lack the necessary capital with which to make proper developments. This fact, however, is not to be wondered at when we consider for a moment the large sums of money that have been squandered by men who have been placed in charge of mining operations, wholly without experience in the management of such work. They may be good business men, but it would be just as wise to put a dry goods clerk in a blacksmith shop to weld tires on wagon wheels as to put him in charge of a mine where he knows nothing of the nature of the work to be done. Men without experience are often imposed upon in letting contracts for timbers and all other supplies, and in not knowing how much labor a man ought to perform in one day. It is therefore important that a man who takes charge of such a work should understand his business,

and not only make occasional visits when it is convenient; and whether they attend to their business or not, the pay-roll goes on all the same. It is therefore not to be wondered at that capitalists hesitate to come to our rescue in the development of our valuable mines. But with the objections of mismanagement and neglect of duty on the part of managers of mining enterprises removed, capitalists will willingly come forward with their money, well knowing that with honest, economical and systematic management, mining is the best business in California to-day.

### California Maple Sugar.

A very interesting product was received at the Agricultural Laboratory of the State University last week from Pleacer county, in the form of maple sugar made from the sap of one of our native California maples, *Acer macrophylla*, or, as it is commonly called, the broad-leaved maple. The *Foothill Tidings* says that in spite of the declaration of old sugar-makers from the East that the trees were not sugar maples, Mr. Moulton, who lives about four miles southeast of Grass Valley, determined to try the sap and found that he could make syrup and sugar of excellent quality. Three University students—Cornelius Lakenen, Herbert Fletcher and Burton Hall—went out to the Moulton place and found that good sugar and syrup had been made by Mr. Moulton from the sap of the native maple. They secured specimens of the sugar and syrup and branches of the trees, and brought them to the University that the sugar might be chemically tested.

We had the pleasure of sampling this sugar the other day, and of seeing the leaves and bloom of the trees. The latter show that the trees are the *Acer macrophylla*, as we have stated. The sugar has the true maple flavor, grain, etc., and leaves, no doubt, of the sugar property of our native maple, if, in fact, doubt generally existed. Maple sugar has been made in this State before. We recall one case in the neighborhood of Santa Cruz a few years ago. It remains to determine how great is the yield of the native tree of certain size and whether the manufacture of the sugar and syrup can be profitably prosecuted.

Our broad-leaved maple is one of the best sidewalk and shade trees in regions where it does well. It has a wide range, too. It attains considerable size and a very beautiful and symmetrical shape. It grows very readily from the seed, which is produced in large quantities. Every spring, under the trees, on the University grounds, the young volunteer seedlings come up thick as a sowing of hickweed, which the plants much resemble when they put forth their first pair of leaves.

We have always looked upon this maple as one of the most promising trees for timber culture planting as well as for wayside, street, or lawn shelter, or ornament. It attains size very quickly in a favorable situation, and its seedlings seem quite hardy.

In clearing up land it will be well to save the maples where their presence can be tolerated. This is already being done in some cases. The *Foothill Tidings* has heard of at least one clearer, Michael Manion, who found many maples while clearing and saved them all. "They make a beautiful shade tree, even if they should not prove to be sugar maples," said Mr. Manion. We are glad that opportunity thus offers to call more general attention to this very beautiful and useful native tree.

**SALTING A MINE.**—"I tell you that a man who has a mine to sell and has ore in it cannot rob a purchaser," said a mining superintendent yesterday. "I'll just tell you what I then considered the meanest thing I ever did in my life, to illustrate what I mean. In 1852, at French Corral, California, I put up the first tail flume ever put up in California. There arose a little litigation with regard to the sluices and the water, and I wanted to get out of the enterprise. I cleaned up \$200 one day from my flume, and I put the amalgam back (salted the claim, you know), in the flume, and got a man to watch me take out \$400 the next day. A few days later I sold this claim for \$7000, and the parties who purchased it cleaned up over \$100,000 out of it in a few months. That's why I say that a miner selling a claim with any ore in it at all cannot rob a purchaser."—*Virginia Enterprise*.

**THE BOSS PROCESS.**—Albert Barber, superintendent of the Barber Mining & Milling Co., Calico, Cal., thus writes to M. P. Boss of San Francisco of the Boss continuous milling process: "We are doing splendid work, the average being above 92 per cent; we worked some Comet ore last week to above 95 per cent; this ore has always been considered the hardest ore to work in the district. I worked the same ore at Waterman, dry crushing, and amalgamated 18 hours in pan and only obtained 92 per cent."

**THE PANLICO.**—Again has the famous Panlico mine, Nev., proven her intrinsic value. Last week seven sacks of ore, weighing about 820 pounds, were worked at the Kinkead mill, yielding a bar of bullion valued at \$11,000. Another lot of second-class ore—20 tons—was worked at the same place this week, from which a bar of gold bullion worth \$9000 was produced. The company is now at work taking out more of this class of ore.

### The Mines and Miners.

BY PEDRO CASTERA.

(Continued from our last.)

[Translated for the Press from *El Minero Mexicano* by M. N. M.]

#### Los Morrongos.

The miners know the meaning of this word, but for those who do not we will give a brief explanation. The *morrongos* are boys who go into the mines with the laborers and to whom are assigned easy duties, such as carrying a light for the foreman of the works, guiding the peons, bringing candles, irons, water, etc. They are expeditious, light, vivacious, restless and quick-tempered. They know the mine—with all its outlets and entrances, cañons and holes, galleries or levels, descensos or resting-places, escondites or hiding-places, and heaps of rubbish, as well as they know their own homes. If the light goes out, they proceed in the dark by touch; if an accident happens, they are the first to give notice of it; if a harretero heats a woman, the child defends her, screams at the man, insults him, and only ceases because another has come to aid him in defending her. After such a quarrel the little fellow thus expresses himself: "The caiman (nickname of a harretero) was heating la Chata (nickname of the woman). The coward, he does not know how to be a man." Sometimes they fight among themselves. If asked why they beat each other, the reply is, "I am learning to be a man." It provokes them to be called little fellows. "I am small but strong," they reply.

Generally they are orphans, but if they have fathers they aid in supporting the family. The writer knew one of these boys in Zacatecas, only nine years old, who maintained a sister of four, and a grandmother of sixty years, with the two reals a day which he earned.

#### They Are Morrongos

Until they reach the age of twelve, peonitos until fifteen, then faeneros, next harreteros, and lastly mandones and perhaps chiefs in their old age. The *morrongo* is not the gamin or pillule of Paris, the *Gavroche*, described by Victor Hugo, nor is he the *chico* of the great city, but the child of the mine. He is the homunculus of Goethe, but formed in the shade by toil, the rapid development of a man though a struggle. Larvæ they are that begin to crawl amid the darkness at the age of five, and at thirty are herculean.

At first, they are children who play in the abysses, and afterward men who know how to vanquish them. Always audacious, never cowards, they are, in general, of good tendencies and noble hearted. In the struggle, however, three-fourths of them succumb to anemia and excessive labor before reaching their twentieth year; when one dies, the others only smile sadly and murmur, "It is better so; now his fatigues are ended and he is with God." Sublime confidence of the child, who, innocent of ingratitude, never doubts the existence of his Divine Father! A reunion of *morrongos* is like a group of birds; they leap, play, chatter, scream and sing. Who knows what exists in the young bird? In both there is song, mirth and innocence; for my part, I prefer the sparrow to the eagle, the child to the man.

Tildio was so called because of his long legs, which were always bare, except on Sundays, and on account of his lightness and agility. A dirty shirt, breeches made of blanket and a piece or crown of a hat constituted his dress. He presented himself before Leon with his eyes down and turning between his fingers the shred of head-covering.

"Where is the fire?" inquired Leon.

"The what?" said the boy, opening his eyes wonderingly.

"The fire, Tildio; where is it?"

"It is in the Preciosa."

Is the whole work burning?"

"Entirely, Amo."

"Why have they not given notice?"

"The mandon sent me in advance. He told me to go up quick and ring an alarm; but there he comes to make report," added the boy, pointing to a man of athletic figure and dark color, who had just come out of the shaft and was approaching the young men.

"A superb man!" exclaimed Henry, looking at him.

The mandon made his statement. "The fire," he said, "had begun without the knowledge of any one, and in a few minutes had spread over more than a hundred varas of the gallery, leaving out off and without communication about eighty men. The Sota minero (deputy), contending against the fire with the others there, had given information and demanded prompt assistance."

Leon communicated this to the administrator, and he in turn to the director-general. In the meantime the patio of the mine had been filled with harreteros and operatives of the neighboring mines, who came to assist, brought together by the sinister alarm. Two thousand men, grouped in a compact mass, were awaiting orders. The director in a loud voice exclaimed: "The rayador to the tiro of Santa Lucia, with fifty paradás, and choke up its mouth! The chief miner with five hundred men will go into the mine! All the pumps into service and adelante—sin novedad!"

A precipitate movement took place, but with order, Leon going toward the mouth of the shaft, which continued throwing out smoke.

"*Mens agita molem*," murmured Henry, following the young man, who was among the harreteros that were hastening through the black and deep tiro singing their alahado.

#### The Ladders of the Mine

Were formed of two large parallel cables which were connected by pieces of live-oak that served as steps; but in spite of their firmness the ladders were creaking under the weight of such a multitude. The walls of the tiro were lined with wood; great beams rested against the hack, forming a square enverjado which sustained a prism opened in the rock with powder, the labor of men and by time. The water of the pumps was falling in copious showers upon the walls of the tiro and wetting the wood, to prevent the fire from attacking it. The smoke was ascending, also a confused clamor; and the distant crackling of the burning wood, the mournful ringing of the church-bell, the sound of the alarm-bell and the song of the harreteros, united to the deafening noise of the tramping upon the trembling ladders, were mingling above the abyss.

Henry was rapidly descending. Soon he felt a foot resting lightly upon his head, another upon his right shoulder, two arms were around his waist, then about his knees, and something like a shadow which was passing from above him with celerity.

"What devil is this?" he inquired of the harreteros, who were going down at his side.

"It is Tildio, Amo."

"Demon of a boy! Then of me he has made a ladder!"

"Tildio, Tildio, bravo!" shouted the harreteros.

In fact, the child had heard Leon's whistle, which was a call to him, and stepping here upon a head, there upon a shoulder, next upon a knee or another head, and propping himself as he could, he was descending with velocity by a truly human ladder. It was enough to make one's head swim to think of it.

#### On the Outside

The director followed, giving orders. Newly arrived people were assisting. The pumps were throwing water which was running through a rivulet near the patio and which was supplied from the drains of other mines, as well as by the tiro of Santa Lucia. The bottom of the shaft of San Miguel, by which the people were descending, was formed like a half orange or semi-sphere—ample, vast, spacious—into the upper part of which disembogued the lower part of the tiro. Two galleries were separated by this species of arch that were parallel to each other, and which communicated by twelve or fifteen canyons. At the opposite extremity was the tiro of Santa Lucia. The gallery to the right was the works of La Luz, the other the Preciosa. In the latter, the lining of wood was burning, and at the end of the works were eighty men who had no possible way of retreat. The communication of the shafts, moreover, by means of the galleries, furnished air to the fire, which was beginning to consume everything.

Leon, Henry, the mandon of the Preciosa, Tildio, and the greater part of the harreteros were grouped on the planes (lowest works) of the shaft of San Miguel. After descending three hundred vertical varas it is necessary to take breath. In front of him, the whole canyon of the Preciosa was on fire. A reddish brilliance filled the mine and communicating canyons, casting upon the works of La Luz a golden reflection and torrents of sparke, which appeared trombas of brilliant and rhnies.

#### Sometimes Tongues of Fire Issued.

Dilating, dazzling, twisting and licking along the walls of the canyons, forcing back the men who were trying to cover them with rubbish in order to smother the fire, but the partly subdued flame would redouble itself and continue devouring the gallery in which it was made prisoner, and the floor of which was covered with a river of living coals that were sparkling with a sinister crackling. At intervals the smoke was concealing or dulling that vision, appearing afterward with new and dazzling magnificence.

"This is superb!" exclaimed Leon. "Do you not feel yourself an artist, Henry?"

"No," replied the latter. "I only feel moistened."

"It is a hell in miniature, but notwithstanding, it is magnificent!"

"It needs devils," added Henry.

"What more devils than our passions!"

"We are losing time, Leon; we have not come here to philosophize."

"It is a question of esthetics, and esthetics is, so to say, the temperament of my soul. Besides, I was giving these poor people a chance to regain their breath."

As if these words

#### Might Have Fanned the Fire,

It darted a long gold-colored flame in the direction of our young men.

"Let the mandon take a number of men and stop up the entrance of this gallery, and the rest follow me," said the young man, rushing through the work of La Luz, and followed by three hundred men.

Then began a great struggle. The men attacked the Indians' god, the fire. It seemed to possess a will, an intelligence, a being. In each one of the canyons that they were trying to choke up, an arm of flame was extended and a hundred or more men were driven backward as if they were only one. The fire was doubling upon itself, appearing afterward more vigorous through another canyon. People continued en-

tering by the tiro of San Miguel and distributing themselves in the works of La Luz. An hour afterward a thousand men could not extinguish the fire that two hours before was but a spark. In the midst of the roaring of the flames, of the crackling of the burning wood, of the incessant hissing of the coals, of the blasphemous and songs of the barberos, the voice of Leon was heard calling out:

"El Tildio—where is Tildio?"

The search was useless. He had disappeared. "Poor child!" murmured Henry; "his life was a hell and his tomb is the same—poor Tildio!"

(To be Continued.)

### Lower California Gold-Fields.

We take the following from the San Diego Union:

The mining excitement continued unabated yesterday, and the discoveries made in the new El Dorado below the line were talked of everywhere. Women as well as men have got the craze, and a number of the gentler sex mixed in with the crowd that examined specimens and talked gold mines at the corner of Sixth and F streets. Several prospectors who returned from the lower country on the steamship Carlos Pacheco this evening before, put in an appearance early, and were compelled to tell the stories of their discoveries over and over again to seekers for information. The stories were all to the same effect, that the discoveries are fabulously rich, and the country between Ensenada and the Gulf is one vast bed of mineral.

#### Rich Placers and Ledge.

Richard Day, an old Colorado miner, who has been mining about twenty miles east of San Rafael since January, arrived on the Pacheco. He leaves on the return trip this morning, taking with him machinery to operate his claim. Mr. Day stated that in the section he came from the placers are very rich and the quartz ledges are simply marvelous. During the year he was in Colorado he never saw anything to compare with the virgin prospects in the lower country. The placers thus far have been worked principally by the dry-washer process with good results. Mr. Day himself has been developing a quartz ledge, but near to where he is at work men are working placers and are averaging \$10 a day to the man. Mr. Day showed samples from his ledge, which are marvelously rich in gold.

W. J. Riffenberg, a capitalist, who knows the lower country thoroughly, said, when asked regarding the discoveries, "It is the richest mineral country I have ever seen. About seventy miles from San Quintin there is a mountain of gold. Men must not go into this country with the expectation of seeing huge nuggets come rolling down the hill to them. They must go there with the expectation of, and tools with which to do hard work. Otherwise they will be disappointed." Mr. Riffenberg is an old miner, was in Colorado and other excitements, and speaks of the discoveries in Lower California as marvelous.

#### A Mountain of Gold.

Milton Santee, who with his son did surveying work on the Real del Castillo last February, said that he found a ledge of quartz of extraordinary thickness and very rich in gold. Croppings from the ledge could be plainly traced for a long distance. Settlers in the vicinity of Real del Castillo reported that rich placer and quartz leads existed all through that mountain. During the week of their stay at the Real, the Santees saw people constantly arriving at the store with small sacks of gold, which they brought to exchange for coin, and also make the necessary purchases of provisions.

This morning the steamship Carlos Pacheco sails for the Lower Coast. She will carry a full complement of passengers, most of whom are prospectors and mining men seeking investments.

#### Three Enthusiastic Miners.

Three miners named White, Moore and Sanford, who arrived yesterday morning from the lower San Quintin district, brought with them rich specimens of quartz which will average \$26,000 to the ton. They were enthusiastic over the gold prospects, and returned to Ensenada last night in order that they may equip 15 or 20 donkeys with supplies and camp fixtures and return to their mines at once.

Tia Juana, "the Gateway to Mexico," has, since the gold excitement, put on an animated appearance. Teams cross the line for the South every 10 or 15 minutes, and many of the residents of the place are preparing to join the begira.

**LEACHING.**—White Pine News: Messrs. Featherstone & Reynolds of the Keystone Mining Company left for Cortez last Saturday to inspect the leaching works at that place. They will obtain estimates of the necessary plant for a small mill of five or six tons daily capacity, which they will erect at once to test the process. If they can successfully work their ore they will build a large mill next year. They have one of the largest mines in Eastern Nevada, and would have no difficulty in keeping a large mill running.

CONSIDERABLE prospecting will be done in Jefferson district, Nev., this summer, and important mineral discoveries will very probably be made. A boom in this district is now in order.

### The Twin Leaf.

Many housewives who had a predilection for "roots and yarbs" in their old homes east of the Rocky mountains, will recognize the plant of which we give an engraving on this page. It is ranked as a native medicinal plant by Dr. Vasey of the Department of Agriculture, and is included in an enumeration of such native plants in a recent publication by him. The common names are "twin leaf" and "rheumatism root." Its scientific name is *Jeffersonia diphylla*, the genus bearing the appellation of the distinguished statesman, Thomas Jefferson.

Twin leaf is a small herbaceous perennial, of the order *Berberidaceae*. The rhizoma or root-stalk is thick and short, emitting a mass of matted fibrous roots. From the root-stalk is sent up a number of long stalked, erect leaves, the leaf and stalk when mature being a foot or

AGRICULTURAL OR MINERAL.—In the action of Hunt against Steese in ejectment, the Supreme Court has reversed the order of the lower court, refusing to grant an injunction, and directed that the injunction be issued in the plaintiff until the final hearing, when the propriety of either dissolving it or rendering it perpetual will be determined according to the merits of the case. The land involved in the suit was purchased as agricultural land from the Central Pacific railroad and used as such for several years prior to defendant looting a portion of it as mineral land. The land in question has not been finally decided in the lower court as agricultural or mineral, and the injunction is granted until that question is decided.

IRON WORKS.—A Portland, Ogn., dispatch dated April 25th says: A special from Ellensburg, W. T., stated to-day that arrangements had finally been made between the Northern

TWIN LEAF OR RHEUMATISM PLANT—*Jeffersonia diphylla*.

more in length. The leaf is curiously parted into two halves, giving rise to the name "twin leaf." As a whole the leaf is round-ovate in form, with the base deeply heart-shaped. When mature it may be six to nine inches in diameter. It is smooth and with the margins entire or wavy-toothed. There are three to five principal veins to each half, which proceed from the point of junction and ramify to the surface. The flowers come from the root on one-flowered naked stalks (scapes), which rise nearly to the height of the leaves. The flower has about four linear-oblong sepals, which drop off upon its opening; within these are eight oblong white petals, three-fourths to one inch long, and spreading and soon falling off. There are eight stamens, one before each petal. The ovary is roundish-oval, one-celled, becoming obovate, and when ripe opening at the top by a transverse lid. This plant grows in rich, shady woods, from Western New York to Wisconsin, and sparingly southward along the Alleghany mountains. It is most abundant in the Western States, from Ohio to Illinois and Kentucky. It has a popular reputation as a stimulant- tonic, especially for the cure of rheumatism.

**BIG STRIKE AT UNIONVILLE.**—Reports come from Unionville that Fred Heyde and Frank Hoenstein have struck a very fine ledge between the old town and Cottonwood. The ore is rich in gold as well as silver, and the prospect is said to be one of the best ever found in Unionville.—*Silver State*.

Pacific and the Moss Bay Steel Co. of England for establishing extensive steel works in this country. Work will begin soon. The iron company agrees to furnish traffic for a branch line to the extensive iron mines of the Upper Cleburne river. It will take a year to construct the works, which will give employment to several thousand men.

AN Eastern trade journal says: "Copper has developed a strong buoyant tendency, but the temporary cornering of the available supply will soon be dissipated, and the present squeeze will be followed by a return to normal values. Notwithstanding the firmness of copper and the alleged scarcity of spot supplies, consumption, both here and in Europe, is falling off in consequence of high prices."

THE shipbuilding at the foot of Sixth street appears to be progressing. The new 1000-ton steamer for the Newport Coal Co. is almost finished, while the Point Lohos and National City have been launched and are ready to receive their engines.

THE 60 stamp mill built for working low-grade ores of the Montana Co. cost \$143,346. Its first year's work resulted in a gross output of \$517,457.

THEY now have 30 machine air-drills at work in the Drumlunnon mine, representing a manual force equal to 360 men if drilling by hand,

### Geology as Applied to Mining.

Stephen Barton of Visalia, Cal., has published a little work entitled "A Rigid Earth being devoted to Geology as Applied to Mining." In his preface he says: In treating of geology as applied to mining the author has been prompted by the hope of contributing aid in arresting a class of mining explorations which have generally ended in disaster to the miner, and which he believes will continue to do so. If our hodies hear any relation to a melted interior other than as a part of the earth, that fact remains to be proven, notwithstanding the fidelity the miners of the Pacific Slope have shown as disciples of the igneous theory. Let the reader draw a picture of the energy exhausted, the hopes blighted, the millions squandered, in a vain effort to connect the source of rich deposits with the effects of fusion. Reared amid the busy scenes of a mining community, a half century of close observation in the mines of New Jersey, Wisconsin and California has served to convince the author that heat was not an agent in the formation of our hodies; and only in instances, and in slight degree, an effect. The suggestion is therefore presented that the theory of a melted interior has no foundation in scientific truth, that there is no loss of heat—either by the earth, the spheres or the system, and that this universe itself reposes on a stable structure.

Mr. Barton devotes separate chapters to continent-making, igneous action, glacial epochs, caloric, radiation of heat, the earth under the spectro-scope, the atomic theory, fossils in California, trends and reliefs, formation of oxides, electric currents, formation of our hodies and electro-chemical elements. The work embraces a review of accepted theories, as well as the author's own ideas and conclusions. It is the purpose of the work to notice the proof on both sides of the argument of some of the mooted questions, and to inquire, among other things, how far the evidence sustains the accepted theory of the radiation of heat into space. Mr. Barton admits that "scientists may regard the foregoing as being too much at war with established theories to be accepted. It will be remembered, however, that there are many perplexing phenomena which accepted theories fail to elucidate." Mr. Barton's concluding remarks are as follows:

Metal-bearing veins do not extend below the beds of the deeper river gorges, neither at those points nor at points intermediate "where there are high hills," as J. Ross Browne would say. Hence, veins do not continue to grow wider with depth. To recapitulate, then, as follows:

1. Precessional motion arises from a diagonal weighting of polar regions.
2. A wearing down of mountain chains has lessened precessional motion, and at the same time filled in the deep-sea connection with polar regions, thus changing the climate of high latitudes.
3. The prime equivalent ratio of affinity of caloric is changed by light and friction.
4. Veins are thrown in the direction of their obtuse angles as the result of a rigid interior of the earth.
5. Metal bearing veins do not penetrate the earth one mile below the water-line, nor cut below the deep-river beds of California.
6. The sun's rays do not exhibit the phenomena of ordinary combustion.
7. The oldest of known rocks are sedimentary.
8. There is no evidence of a former higher temperature at the equator.
9. The phenomena of tides is based on the philosophy of a rigid earth.
10. Periods of disturbance elevate coast-lines; periods of repose depress them, and, therefore, the theory of folding is at fault.
11. The rule that high coast-lines face the broader oceans applies best to the larger islands.
12. The trend of mountain formations is sometimes at right angles with coast-lines.
13. Electric currents are the base of the magnet, and encircle the surface of the magnetic earth, running from west to east.
14. All the phenomena of the metal-bearing veins may be produced by electro-chemical action without the aid of heat.
15. The timber used in mines becomes charged with gold by electro-chemical action.
16. Gold and roscolite form in the contact fissures between aqueous formations.
17. The observed facts show that the crushing force met with in stone quarries is in the direction of the axis of mountain chains, and not from the sea.

Hence, we conclude that the theory of a melted interior of the earth is without foundation, and that the forces employed in forming ore hodies only act near the surface.

WM. W. HARPER, for several years foreman of the Cons. California and Virginia, will shortly leave for Australia to accept a position under W. H. Patton at the Broken Hill mines.

THE copper mines in Esmeralda county are about to be operated by a New York company. These mines are near the C. & C. road, and are not far from the Sodaville station.

AT Oregon City a plant for the manufacture of cement is being put in at a cost of \$40,000. The rock is found in Douglas county, and is said to be inexhaustible.

## SAN FRANCISCO

Saturday Morning, May 5, 1888.

## TABLE OF CONTENTS.

**ILLUSTRATIONS.**—Compound Engine for Marine Use, 277. Model Dwelling House; Arrangements of Drifts and Cross-Cuts for Bank Mining, 281.

**EDITORIALS.**—California Marine Engines; Tin; Coal at Livermore; Some New Facts in Pocket Mining, 277. Passing Events; The Apex vs. the Square Location; Mining Keeps Well to the Front; The Lower California Mines; Electric Power, 280. Bank Blasting; Reduction Works at San Diego; Modern Dwellings, 281.

**MISCELLANEOUS.**—The Comstock; California Maple Sugar; The Mines and Miners, 278. Lower California Gold Fields; The Twin Leaf; Geology as Applied to Mining, 279.

**MECHANICAL PROGRESS.**—The New Pulping Process; Making Old Steel Rails New; A New Process of Electrical Welding; New Method of Melting Iron; Shaft's Displacing Belts, 282.

**SCIENTIFIC PROGRESS.**—Scientific Methods; Speculative Fancies; What is Instinct; Weather; Granite in Glass-Making; Origin of Western Tornadoes; Compressed Wood; Some of the Lessons of the Storm; Velocity of Electricity; Preserving Butter, 283.

**GOOD HEALTH.**—Female Physicians in New York; A New Treatment for Boils and Carbuncles; A New Antidote for Rattlesnake Poison; Insects in Ears; Hot Water to Relieve Thirst; Newly Built Houses; Chief Cause of Coal Mine Fatalities; Water in the Ground; The Hot-Water Cure; Railroad Accidents, 283.

**USEFUL INFORMATION.**—Professional Dusters; Utilizing Wood; A Dead Black Paint; A Filling Soap; A New Non-Inflammable Material; Experiments in Marching; Population of the Pacific Coast; Pennsylvania Petroleum; To Prevent Milder, 283.

**ENGINEERING NOTES.**—All-Rail Route to Asia via Alaska; The Value of a Good Engineer; The Panama Canal; A Long Telegraph Wire, 283.

**MINING SUMMARY.**—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 284-5.

**MINING STOCK MARKET.**—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 288.

## Passing Events.

Another dividend-paying mine has been added to the Comstock list. The Hale & Norcross has declared a dividend for the first time since 1871. It is thought that Savage will be the next one to follow suit. The Comstock production is very rapidly increasing, and is now up to about a million a month.

The decision by the Board of Supervisors to require a 90 degree fire test for all petroleum used for fuel in this city will work a hardship to the manufacturing interests. Heretofore the liquid fuel used here has been only up to the 80-degree test. The difference makes quite a serious item in the expense of refining the oil.

The development in the Divoll or Bonanza mine in Tuolumne county shows the possibilities of the "pocket" mines of that region. Several pockets have previously been found in this mine, and the yield has been very large.

The establishment of smelting works in San Diego is a new enterprise. Sampling works are also being erected, and a blast-furnace for iron ores. Experience elsewhere has proven it to be the best plan to first open and develop mines, before putting up reduction works.

LAST week the State Mining Bureau received a fine collection of British Guiana woods, consisting of 72 samples.

## The Apex versus the Square Location.
